The American bison or buffalo is somewhat smaller than the aurochs, and has shorter and thicker horns, and a shorter tail, but its hump and fore-quarters are higher, and more shaggy. The females are much inferior to the males in bulk, weighing only about 1,200 pounds, whereas an old bull in good condition will weigh 2,000 pounds. The American animal differs in one very important respect from the European species, due to the difference in their habitats. The aurochs was a native of a region covered with forests, where large herds could not find open pasturage of any considerable extent, and consequently moved about only in small bands, whereas the American animal had open to it the immense, grassy prairies and plains of the interior of this continent, and was able, and in effect, forced to join into vast herds, so that it acquired gregarious habits. When North America was explored by white men, the bison was first encountered in the valleys of the Alleghanies, and scattered throughout the prairies of the Mississippi valley, north of the Tennessee River. Its principal home, however, was upon the grassy plains, between the Missouri River and the Rocky Mountains, where the herds sometimes contained hundreds of thousands of individuals, and grazed all the way from southern Texas to the shores of Great Slave Lake. They wandered through the valleys of the Rocky Mountains, to the plains of New Mexico, Utah, and Idaho, but seemed never to have crossed the Sierra Nevada. Those east of the Mississippi River were probably killed off before the beginning of the 19th century, and by 1850 none remained east of the dry plains. The building of the Union P. and Kansas P. R.R.'s, where the early trains were sometimes stopped by herds crossing the tracks, soon led to the disappearance of the animals from the central plains; and by 1875 they were divided into two distinct groups, a northern and a southern. These were rapidly slaughtered by parties of men who followed the animals at all seasons, and killed them for their hides, which, as "buffalo robes" became more and more valuable, until by 1890 the Texan herd had been utterly exterminated, and of the northern herd, none remained except such as had been gathered by

the government for preservation in Yellowstone Park, and a few hundred that still survive in the remote forests beyond the North Saskatchewan. The herd in Yellowstone Park amounts to about 100 and will probably be maintained under the protection of law. Small bands are living in private parks and zoological gardens in various parts of the world. Thus, perhaps, 500 or 600 living bison remain as the sole relic of the millions of these valuable animals, which half a century ago ranged our western plains, and which were recklessly wasted.

The buffalo herds were made up of small companies, consisting of a patriarchal old bull, several cows, and a number of young of various ages, and thousands of these companies would graze in the same region, all moving slowly in the same direction, so that travelers would never be out of sight of bison during a whole day's journey. They were more or less nomadic, wandering from one part of the plains to the other in search of fresh pasturage. Thus on the approach of winter a general movement always took place from the high, central plains toward the warmer south, and also into the shelter of the wooded valleys of the foot-hills. In these journeys they had the habit of traveling in single file, thus forming long, narrow paths, which the plainsmen called "buffalo trails," yet traceable in many places. In spite of their weight and apparent clumsiness, they swam rivers with ease, and climbed about the mountains with remarkable agility. Nevertheless they chose the easiest places, and the well-marked buffalo-trails were the guides for explorers, and were most deeply imprinted in those mountain passes, which are now the highways of commerce. The sexes kept together throughout the year, and as is usual among gregarious animals, there was constant fighting among the bulls for the supremacy of their bands, the old leaders being overthrown by younger and more vigorous aspirants, as soon as their strength began to wane. Thus the very best sires were continually selected by the law of battle, and the race kept at its highest point. The herding was a measure of protection against the enemies which hung upon the skirts of every band. The grizzly bear was perhaps the only animal that could vanquish a bison bull in fair fight, but pumas and wolves were ever on the watch to seize any young or feeble ones that strayed from the band. When attacked the band would instantly form a close crowd with the cows and calves in the centre, protected by the bulls, forming a circle with lowered heads on the outside. The calves were born in the spring, a single one, as a rule, to each cow after a gestation of about nine months.

To the western Indians the bison was the principal resource for food and shelter, and was continually hunted. In the days before firearms, the Indians would approach them on foot, by creeping within bowshot on all fours, often disguised in the skin of a calf or an antelope; or would rush the herds upon horseback. They also had the practice in rough countries of driving the buffaloes into enclosures or small canyons, where they could easily be slaughtered; or sometimes would force them over a cliff, to be killed by the fall. Besides eating the flesh as fresh meat, vast quantities of it would be cut into strips each autumn, and dried in the sun for winter use; while the northern tribes

chopped it into fine pieces, mixed it with berries, and preserved it in skin bags, mixed with boiled fat, and so formed the highly portable and nutritious food called "pemmican." The disappearance of the buffalo consequently meant starvation to the Indians, as well as the loss of the principal material for warm clothing and bedding, and the Indian wars which raged upon the plains, during the third quarter of the 19th century, were mainly due to the desperate efforts made by these people, to preserve their hunting-grounds.

Species of fossil bisons have been found both in Europe and America, associated with the remains of mammoths, mastodons, and other extinct animals of the Quaternary Period. Some of these extinct bisons exceeded in size any of the living species, the bony horn-cores in one being six feet from tip to tip (the length of the horns themselves must have been considerably greater); the height of this species is estimated to have been over six feet at the shoulder.

The literature relating to the American buffalo is as extensive as the story of the western States. The most complete and special accounts are: J. A. Allen's monograph, 'The American Bisons' republished by the United States Geological Survey in 1875; and W. T. Hornaday's 'Extirpation of the American Bison,' in the annual report of the Smithsonian Institution for 1887. For the more picturesque and adventurous side of the animal's history, and its hunting, consult Audubon's 'Quadrupeds of America'; Catlin's 'North American Indians'; Gregg's 'Commerce of the Prairies'; Dodge's 'Black Hills'; 'Butler's 'Great Lone Land'; and the accounts of western explorations by such writers as Pike, Fremont, Marcy, Long, Emory, and Stansbury.

Bispham, bis'pām, **David S.**, baritone singer: b. Philadelphia, Pa., 5 Jan. 1857, of Quaker parentage. Educated at Haverford College, Pennsylvania, he later studied music and singing in England and Italy. His début was made as the Duc de Lonqueville in 'The Bassoche,' London, in 1891, and since then he has been the principal baritone of the Royal Opera Company, Covent Garden, London, occasionally visiting the United States on an operatic tour. An accomplished linguist, he is equally at home in German, French, or Italian, but his greatest successes have been in Wagnerian roles, such as 'Alberich' and 'Wolfram.'

Bissagos, bis-sä'gōz, a group of islands, about 20 in number, near the west coast of Africa, opposite the mouth of the Rio Grande, between lat. 10° and 12° N., belonging, like the mainland opposite, to Portugal. The largest, Orango, is about 25 miles in length, and most of them are inhabited by a rude negro race. The inhabitants cultivate maize, bananas, and palms, but their chief employment is in fishing. Most of the islands are under native chiefs, who are nominally vassals of Portugal. At Bolama, or Bulama, once a British settlement, but abandoned in 1793, there is a thriving Portuguese town, which is the seat of government.

Bissão, bes-sä'ō, an island and Portuguese station closer to the African coast than the Bissagos and opposite the Jeba's delta. Before the prohibition of slavery by the Portuguese government it was an important slave market.

Bissell, **Edwin Cone**, American biblical scholar: b. Schoharie, N. Y., 2 March 1832; d. Chicago, 9 April 1894. He prepared for the ministry at Union Theological Seminary, N. Y., and held Congregational pastorates at West-hampton, Mass., San Francisco, Cal., and Winchester, Mass., and was professor of Hebrew in the Hartford Theological Seminary, 1881-92, and at the McCormick Presbyterian Seminary, Chicago, 1892-4. He published: 'The Historic Origin of the Bible' (1873); 'The Pentateuch: Its Origin and Structure' (1885); 'Biblical Antiquities' (1888); 'Genesis Printed in Colors, Showing the Original Sources from which it is Supposed to Have Been Compiled' (1892); 'The Apocrypha of the Old Testament, with Historical Introductions,' his greatest work (1880).

Bissell, **William Henry Augustus**, American prelate of the Episcopal Church: b. Randolph, Vt., 10 Nov. 1814; d. Burlington, Vt., 14 May 1893. Entering the Episcopal ministry in 1839, he was successively rector at West Troy, Lyons, and Geneva, N. Y., and 3 June 1868 was consecrated second bishop of the diocese of Vermont.

Bissell, **Wilson Shannon**, American lawyer: b. New London, N. Y., 31 Dec. 1847; d. Buffalo, 6 Oct. 1903. He graduated at Yale University in 1869; and studied law in Buffalo with Lansing, Cleveland & Folsom. In 1872 he formed a partnership with Lyman K. Bass, the firm of which Grover Cleveland became a member in 1873. When Mr. Cleveland was elected governor of New York the firm was dissolved. Subsequently it was reorganized, and in 1900 consisted of Bissell, Carey & Cooke. He has been a delegate to several State conventions; in 1884 was a Democratic presidential elector; and in 1893-5, during Mr. Cleveland's second term as President, was postmaster-general of the United States.

Bissen, **Hermann Wilhelm**, bis'sën, hër'-mān vil'hēlm, Danish sculptor: b. Schleswig, 1798; d. Copenhagen, 10 March 1868. From 1823 to 1833 he studied in Rome under Thorwaldsen, who, in his will, commissioned him to complete his unfinished works. In 1850 he was made director of the Academy of Arts, Copenhagen. Among his masterpieces are the 'Val-kyrie,' 'Cupid Sharpening His Arrow,' and 'Moses'; his 'Orestes,' and a frieze 134 feet long, perished in the burning of the Christian-borg at Copenhagen (1884).

Bissex'tile, the ancient name of leap year, so called from the sixth day before the calends of March being repeated or taken twice. See CALENDAR.

Bisson, **Alexandre**, be-sôn, ä-lëks-andr, French dramatist and musical composer: b. 1848. His vaudeville, 'Four Cuts with a Pen-knife,' won for him instant celebrity. 'The Deputy from Bombignac' is his masterpiece. Other comedies or operettas were: 'The Late Toupinel'; 'The Joys of Paternity'; 'The Pont-Biquet Family.' With Théodore de La-jarte he was joint author of a 'Grammar of Music' and of a 'Little Encyclopædia of Music.'

Bistineau, bis-te-nō', a lake in north-western Louisiana, dividing Bossier and Bienville parishes, about 30 miles in length from north to south and 2 in breadth. It receives the Dauchite

River from the north, and communicates with Red River by an outlet at its southern extremity. It is navigable for steamboats.

Bis'tort (*Polygōnum Bistorta*), a perennial plant of the buckwheat family, and from its astringent properties (it contains much tannin) sometimes used medicinally. It bears a raceme of flesh-colored flowers. It is also called adder's-wort and snake-weed, from being a supposed remedy against snake bites. The American representative is a naturalized plant (*P. viviparum*), found on Alpine summits of New England and on the shores of Lake Superior and northward. It bears an erect spike of flesh-colored flowers.

Bistre, bis'ter, a reddish brown water-color, generally obtained from the soot that collects in chimney-flues. This is pulverized and washed to remove the saline ingredients. The finest sediment is then dissolved in vinegar, to which gum-water is afterward added. It was formerly much used for making painters' crayons, and also for a paint in water-color designs. Sepia, however, is now preferred to it, as it has a more agreeable color and is more easily employed.

Bithur, be-thoor', India, a town 12 miles northwest of Cawnpore, on the right bank of the Ganges. In the Indian mutiny it had some notoriety conferred on it from being the residence of Nana Sahib, also styled the rajah of Bithoor. The town was long the abode of a line of Mahratta chiefs, the last of whom died without issue in 1851. His adopted son, Nana Sahib, whose proper name, however, was Dhundoo Punt, claimed the succession, but his title was ignored by the East India Company, a proceeding which is believed to have stimulated him to his subsequent deeds of atrocity. Gen. Havelock gained a brilliant victory over the rebels in the vicinity, and subsequently quantities of treasure belonging to the Nana were discovered by the troops in a well close to the palace. Pop. 7,000.

Bithyn'ia, anciently a country in Asia Minor, on the Black Sea, the Bosphorus, and the Sea of Marmora, and bounded on the south by Phrygia. In early times it was called Bebrycia, from the Bebrycians who inhabited it. Before the time of Cræsus, Bithynia was an independent state, under its own princes. After the death of Prusias I., in the war against Cræsus, it fell into the power of the Lydians, 560 B.C.; into that of the Persians, 555 B.C.; and into that of Alexander, 334 B.C. The restorer of the Bithynian throne was Bias or Bas, a native prince, at the court of one of whose successors, Prusias II., Hannibal took refuge, and where he ended his life by poison, 183 B.C. Nicomedes, the last king of this race, bequeathed his kingdom to the Romans, 75 B.C. The famous cities of Nicomedia, Nicæa, and Heraclea were in Bithynia. In the 11th century Bithynia was conquered by the Seljuks. In 1208 a new kingdom was founded there by the Ottoman Turks, of which, in 1327, Prusa was the capital. See Ramsay, 'Historical Geography of Asia Minor' (1890).

Biting-lice. See BIRD-LICE.

Biton, bi'ton, Greek mathematician, of uncertain date, but supposed to have been a contemporary of Archimedes, wrote a work of some

interest on warlike engines, and dedicated it to Attalus, king of Pergamos. It is to be found in the 'Mathematici Veteres' of Thevenot. (2) The son of Cyclyppe mentioned in the legend of Cleobis and Biton.

Bitter, Arthur, pseudonym of SAMUEL HABERSTICH, Swiss poet and story writer: b. Ried, near Schlosswyl, 21 Oct. 1821; d. Bern, 20 Feb. 1872. Novelettes, stories, and poems proceeded from his pen for many years, all characterized by sympathy of tone and inoffensive realism, 'Tales, Romances, and Poems' (1865-6), being most pleasing.

Bitter, Karl Theodore Francis, Austro-American sculptor: b. Vienna, Austria, 6 Dec. 1867. He came to the United States in 1886 and soon acquired world-wide reputation. He executed the sculpture on the main buildings of the World's Columbian Exposition, and was appointed director of sculpture at the Pan-American Exposition at Buffalo, and the Louisiana Purchase Exposition at Saint Louis.

Bitter Almonds. In medicine the oil of bitter almonds, containing prussic acid, is used as a gastric sedative and as an antispasmodic. See PRUSSIC ACID.

Bitter Ash, the quassia tree. See QUASSIA.

Bitter-root, *Lewisia rediviva*, a plant of Canada and part of the United States, order *Portulacæ*, so called from its root being bitter though edible, and indeed esteemed as an article of food by whites as well as Indians. From the root, which is long, fleshy, and tapering, grow clusters of succulent green leaves, with a fleshy stalk bearing a solitary rose-colored flower rising in the centre, and remaining open only in sunshine. Flower and leaves together, the plant appears above ground for only about six weeks. California bitter-root (*Echinocystis fabacea*) and Natal bitter-root (*Gerardanthus macrorrhiza*) both belong to the gourd family.

Bitter Root Mountains, a range of the Rocky Mountains, in Montana, deriving its name from a plant with rose-colored blossoms, whose slender roots are used by the Indians for winter food. The chief summits are Lolo Peak and St. Mary's Peak.

Bitter Root River, a tributary of the Columbia in Montana, flowing north into Clark's River in Missoula County; length about 110 miles. Gold has been found in this region.

Bitter Root Valley, a valley on the east of the Bitter Root range, in Montana, 90 miles long and 7 miles wide, enwalled by lofty mountains, and abounding in farms and cornfields.

Bitter Spar, rhomb-spar, the crystallized form of dolomite or magnesian limestone. The name is derived from the magnesia contained in it, the taste of salts of magnesia being bitter.

Bitter-sweet, **Dulcamara**, or **Woody Nightshade**, *Solanum Dulcamara*, a sprawling vine of the natural order *Solanacæ*, native of Europe and Asia, and introduced into the United States. It has purplish or blue flowers arranged in cymes which are succeeded by attractive inedible berries. The leaves have been used medicinally in the form of an extract. The name, properly false bitter-sweet, is given to *Celastrus scandens*, a handsome climber of the natural order *Celastracæ* found from eastern Canada to South Dakota and southward to New Mexico.

BITTER-SWEET — BITUMEN PROCESS

It often grows 20 feet tall and is perhaps most attractive on account of its orange-yellow fruits which split open and expose the crimson seeds. Both seeds and fruits remain attached to the plants during the winter.

Bitter-Sweet, a once popular narrative didactic poem by J. G. Holland, published 1858. It contains about 3,500 lines, and is descriptive of New England rural life.

Bitter Vetch, a name applied to two kinds of leguminous plants: (1) *Ervum ervilia*, a lentil cultivated for fodder; and (2) all the species of *Orobus*, for example, the common bitter vetch *O. tuberosus*, a perennial herbaceous plant with racemes of purple flowers and sweet edible tubers.

Bittern, a bird of the heron family and genus *Botaurus*, several species of which exist in various parts of the world. The bitterns differ from the herons in their lesser size, shorter neck, comparative shortness of the legs, and superior length of toes, and in their nocturnal habits and loud voices. Otherwise their haunts, food, and manner of life closely resemble those of herons (q.v.). The only North American species is the common bittern (*B. lentiginosus*), which is spread throughout the United States and southern Canada in all suitable places, often close to towns. Its length is about 25 inches, and the plumage is tawny brown of various shades, excessively variegated everywhere; the neck is striped with dull yellow and has on each side a dark patch. Both sexes, and the young, are alike in plumage. The Old World species (*B. stellaris*) is very similar, but has more red on the upper parts, and green about the head. It is found numerously from Ireland to Japan, in India and throughout all Africa. Other species or varieties spread the range of the genus to New Zealand and the South Sea Islands. The one great peculiarity of the bitterns, to which they owe their Latin and many local names, is their extraordinary vocal utterance in spring, which in the European species is likened to booming by everyone who has heard it, and has been called "a loud and awful voice." The old fable that this sound was produced in some mysterious way by the bird while it held its beak plunged into the mud is untrue; and the flesh is no longer esteemed as a dainty, as it was some centuries ago. The voice of the American bittern is a droning, thumping noise, which has been likened to the driving of a stake with an axe, or, more often, to the working of an old-fashioned pump-handle. Hence the rural names, "stake-driver," "mire-drum," "bog-pumper," "thunder-pump," and the like. Nuttall attempted to suggest the sound of the syllables "pump-au-gah"; but Samuels succeeds better. He writes: "In the mating season, and during the first part of the period of incubation, the male has a peculiar love-note, that almost exactly resembles the stroke of a mallet on a stake; something like the syllables 'chunk-a-lunk - chunk, quank - chunk - a - lunk - chunk.' I have often, when in the forests of northern Maine, been deceived by this note into believing that some woodman or settler was in my neighborhood, and discovered my mistake only after toiling through swamp and morass for perhaps half a mile."

A genus of smaller birds, *Ardetta*, is known as that of the "least bitterns." One species (*A.*

exilis) occurs over most of North America, and related species belong to South America. They are intermediate between the true bitterns and the night-herons.

Consult Coues, 'Birds of the Northwest' (1874); and Newton, 'Dictionary of Birds' (1896), and the other authorities therein cited.

Bittern, or **Salt Oil**, the name given to the syrupy residue from evaporated sea-water after the common salt has been taken out of it. The syrup contains salts of magnesium, which give it a bitter taste, and it is employed as a source of them. It is also one of the sources of bromine. Bittern procured from the salt works at Epsom, England, was formerly the source of sulphate of magnesium, hence styled Epsom salts. See SALT.

Bitternut. See HICKORY.

Bitters, a class of compounds largely employed as appetizers and digestants. They are for the most part alcoholic drinks to which some plant containing a bitter principle is added. The bitter principles are either alkaloids, as in the quinine of calisaya, or amaroids, which are widely distributed in plants. The most commonly employed bitters are quassia, gentian, angostura, cascarrilla, wild cherry, and cinchona. Medicinally bitters are classed as simple and aromatic, the latter containing volatile oils in addition to the bitter principles. The simple bitters mostly used are quassia, gentian, and calumba. The aromatic bitters are cascarrilla, eupatorium (boneset), angostura, serpentaria, and chamomile.

Bitterwood, various trees and shrubs of the genus *Xylopi* of the natural order *Simarubiaceae*, noted for the bitterness of their wood which is used for furniture because of its resistance to insects. One Brazilian species (*X. sericea*) furnishes a peppery fruit and a cordage fibre. The name bitterwood is also given to *Picrania excelsa* (*Quassia excelsa* of some botanists) belonging to the natural order *Simarubiaceae*. This tree is a native of the West Indies and is used like quassia (q.v.).

Bit'tinger, **Lucy Forney**, American historical writer: b. Cleveland, Ohio, 29 Aug. 1859. She has published 'Memorials of Rev. J. B. Bittinger' (1891); 'History of the Forney Family of Hanover, Pennsylvania' (1893); and 'The Germans in Colonial Times,' (1901), a work of much value.

Bitu'men, a general term, perhaps first used by Pliny, and including various native hydrocarbons, such as petroleum, asphaltum, elaterite, and grahamite. The bitumens are probably all of vegetable origin, and while not confined to any particular geological formation, they occur most abundantly at or near the earth's surface, often in connection with rocks containing organic remains.

Bit'umen Process, the first known method of fixing the image of the camera, so as to make it permanent. The blackening action of light upon salts of silver was known in the 18th century, but no method was known for fixing the image obtained with salts of silver until about 1838. The bitumen process was perfected in 1827 by a Frenchman, Nicéphore de Niépce. He coated plates of metal with a solution of asphaltum in oil of lavender, and then, after drying them, he exposed them for a pro-

BITUMINOUS COAL—BIVALVES

digious length of time in a camera. A very faint image was the result. The plate was subsequently immersed in a developer consisting of one part of oil of lavender and 10 parts of petroleum, which slowly dissolved the parts unaffected by light, leaving a permanent picture formed of those parts of the asphaltum that the light had rendered insoluble. Subsequently Daguerre became associated with Niépce, and together they improved the bitumen process until Daguerre said that "the time required to procure a photographic copy of a landscape is from seven to eight hours; but single monuments, when strongly lighted by the sun, or which are themselves very bright, can be taken in about three hours." See CAMERA; PHOTOGRAPHY.

Bituminous Coal. See COAL.

Bituminous Limestone, a limestone impregnated with asphaltum or mineral pitch. Petroleum grades insensibly into maltha, and this in turn into asphalt or solid bitumen. The term bituminous limestone is therefore applied to almost any limestone carrying hydrocarbon compounds having an asphaltic base, as distinguished from the paraffine base of many petroleum. Bituminous limestone is found at many localities in the United States, particularly in Indian Territory, California, and Arkansas. Its chief commercial use is as a paving material, but it also serves as a source of asphaltic products.

Bivalves, those mollusks of the class *Pelecypoda* (q.v.) whose coverings consist of two concave shell plates or valves.

Bivalves, (for example, the clam) are entirely protected by the valves, which are connected by a hinge, consisting of a large tooth or teeth (usually three), and a ligament. In the clam both valves are alike, in the scallop the hinge margin is eared, and the shell is marked with radiating ridges, while in most bivalves there are simple lines of growth. On the interior, which is usually lined with mother-of-pearl, are either one (in oysters and scallops) or two (clams, etc.) roundish muscular impressions made by the single or the two adductor muscles by which the valves are closed. The shell is often covered by an epidermis. The hinge is situated directly over the heart, and is therefore dorsal or "hæmal." The shell is secreted by the thickened edge of the mantle or body-walls. There is in bivalves in distinction from snails (*Gastropoda*) no head, and the mouth is not armed with teeth or a lingual ribbon, present in snails. The mouth is small with soft lips, and in each side is a pair of labial palpi. The short œsophagus opens into a small stomach which receives the contents of the liver. The long intestine is coiled in the visceral mass, the solid disk-like portion of the body in the clam and oyster; the intestine also passes through the ventricle of the heart, and then ends opposite the upper division of the siphon. This heart is three-chambered, consisting of a ventricle and two auricles. The siphon forms the so-called head of the clam, though it is situated at the posterior end of the body; it forms a double tube, ending in an excurrent and incurrent orifice surrounded by a circle of tentacles which are sensitive to the touch. The siphon is very long in the clam (*Mya*) and other bivalves which burrow in the sand or mud and live in deep holes. Locomotion is effected by the

so-called "foot," which is a wedge-shaped or hatchet-shaped fleshy tongue-like mass situated at the front end under the mouth. Its hatchet-shape gives the name *Pelecypoda* to the class. This foot is enormous in the razor-fish, which burrows with extreme rapidity in the sand. In fixed bivalves, such as the oyster and mussel, the foot and siphon are reduced by atrophy or are entirely wanting. There being no head, there are usually no eyes, except in the scallops, where they are numerous, large, and situated on the thickened edge of the mantle. Bivalves breathe by one pair, more usually two pairs, of leaf-like gills; situated on each side of the visceral mass. The individuals are bisexual, each being male or female. The nervous system consists of three pairs of ganglia, connected by a nerve-thread. The suprœsophageal ganglion is the so-called "brain," being situated over the mouth; the pedal ganglion is in the centre of the foot, while the visceral ganglion is near the middle of the body. Most bivalves possess an organ of hearing or of equilibration, a very minute otocyst situated in the centre of the foot, and connected by a nerve with the pedal ganglion. The ovaries are yellowish, voluminous glands forming the larger part of the visceral mass. These mollusks are very prolific, the oyster laying about 2,000,000 eggs.

In the oyster (*Ostrea*) or in *Anomia* the shell is inequilateral, one valve, usually the left and lower one, being fixed to some object, and the intestine does not pass through the ventricle; in *Arca* the ventricle is double. In *Lucina* and *Corbis* there is but one gill on each side, and in *Pecten*, *Spondylus*, and *Trigonia* the gills are reduced to comb-like processes. Contrary to the habits of most bivalves, the scallop can skip over the surface of the water by violently opening and shutting its shell. *Trigonia* is also capable of leaping a short distance, while *Lima* is an active flyer or leaper. The American oyster is dioecious, while most mollusks are monœcious or hermaphroditic. The foot varies much in form; in the mussel, *Pinna*, *Cyclocardia*, and the pearl-oyster it is finger-shaped and grooved, with a gland for secreting a bundle of threads, the *byssus*, by means of which it is anchored to the bottom. The foot in the quohog, *Neulimia* and *Clidiophora*, is large, these mollusks being very active in their movements. In *Glycimeris* the fringe is toothless, much as in the oyster. In *Mactra* the middle tooth of the hinge is large, the corresponding cavity large and triangular. In *Saxicava* and *Panopæa*, the pallial line is represented by a row of dots. In *Macoma* the siphons are very long.

Lithodomus, the date-shell, one of the mussels, bores into corals, oyster shells, etc.; the common *Saxicava* excavates holes in mud and soft limestone, as does *Gastrochana*, *Pholas*, and *Petricola*. Certain boring lamellibranchs, such as *Pholas*, are luminous.

A very aberrant form of bivalve mollusk is *Clavagella*, in which the shell is oblong, with flat valves, the left cemented to the sides of a deep burrow. The tube is cylindrical, fringed above, and ending below in a disk, with a minute central fissure, and bordered with branching tubules. In *Aspergillum*, the watering-pot shell, the small bivalve shell is cemented to the lower end of a long shelly tube, closed below by a perforated disk like the nose of a watering-pot.

BIVALVE MOLLUSCA.

^{1,3} *Cytheria dione*.

^{4, 5} *Cardium aculeatum*.

^{6, 7} *Hemicardium cardissa*.

^{10, 11} *Tridacna squamosa*.

¹² *Hippopus maculatus*.

Bivalves, in growing, pass through a pre-swimming larval stage called a "trochosphere," resembling a top, and moved by a circlet or zone of cilia. After a while two flaps (*vela*) arise on each side of the mouth, forming the *veglicher* stage; meanwhile the shells arise, and as they become larger and heavier, the young bivalve sinks to the bottom, and begins to use its "foot" for burrowing.

Some bivalves arrive at maturity in a single year. The fresh-water mussels live from 10 to 12 years, while the giant clam (*Tridacna gigantea*) probably lives from sixty years to a century.

The bivalves began to appear in the Cambrian Period; they became more frequent in the Ordovician and Silurian, but they did not abound until toward the Mesozoic Age, since the seas during the Palæozoic Age were crowded with brachiopods (q.v.). Oysters date from the beginning of the Mesozoic. The genus *Mucula* and its allies are very primitive forms, and nearly allied to the earliest known bivalves. Of about 15,000 known species of bivalves, two thirds (10,000) are fossil.

The class *Pelecypoda* (or *Lamellibranchiata*) is divided by the gill characters (see Parker and Haswell's Zoology) into five orders, namely: (1) *Protobranchia*, (2) *Filibranchia*, (3) *Pseudo-lamellibranchia*, (4) *Eulamellibranchia*, (5) *Septibranchia*; and by Dall, from the hinge-characters, into three ordinal groups: *Prionodesmacea*, *Anomalodesmacea*, and *Teleodesmacea*. In Neumayr's group *Palæoconcha*, now forming a part of the *Prionodesmacea*, are included certain primitive types which appear to have given origin to certain more modern groups. For further information and the literature of the subject see MOLLUSCA.

Bixby, James Thompson, American author and clergyman: b. Barre, Mass., 30 July 1843. He graduated at Harvard in 1864, and became a Unitarian minister. He has published: 'Similarities of Physical and Religious Knowledge' (1876); 'The Crisis in Morals' (1891); 'Religion and Science as Allies' (1895); 'Ethics of Evolution' (1900); 'The New World and the New Thought' (1902).

Bizet, Alexander Cesar Leopold, be-ză, a-lëks-ändr sä-zăr lä-ö-pöld (better known as **GEORGE BIZET**), French composer: b. Paris, 25 Oct. 1838; d. there, 3 June 1875. He studied with Halévy, whose daughter he married, and at the Paris Conservatory. His operas include: 'The Pearl Fishers' (1863); 'The Fair Maid of Perth' (1867); 'Djamileh' (1872); and 'Carmen' (1875), his most famous composition, which retains all its early popularity and is founded on Mérimée's novel of that name.

Bjerregaard, byër-re-gärd, Carl Henry Andrew, Danish-American writer: b. Fredricia, Denmark, 24 May 1845. He served five years in the Danish army, and came to America in 1873. He has been librarian of the Astor Library, New York, from 1879, and has written: 'Mysticism and Nature Worship'; 'Being and the Philosophical History of the Subject.'

Björnson, Björnstjerne, byërn'sûn, byërn'sher-ang, Norwegian novelist, poet, and dramatist: b. Kvikne, 8 Dec. 1832. He entered the

University of Christiania in 1852, and he speedily became known as a contributor of articles and stories to newspapers and as a dramatic critic. From 1857 to 1859 he was manager of the Bergen theatre, producing during that time his novel, 'Arne' (1858), and his tragedy of 'Halte Hulda.' He was at Christiania part editor of the *Aftenblad* in 1860, then lived several years abroad, and in 1866 became editor of the 'Norsk Folkeblad.' In 1869-72 he was co-director of a Copenhagen periodical, and much of his later life has been passed abroad. The democratic tendencies to be found in his novels have found a practical outcome in the active part taken by him in political questions bearing upon the Norwegian peasantry and popular representation. He has been for a long period the leader of the Norwegian republicans, and the national entity symbolized by the change made in the Norwegian flag on 1 Jan. 1901 is more nearly due to him than to any one else. He is the greatest distinctively Norwegian writer of his day, and his popularity among his countrymen is very great. In 1880-1 he traveled and lectured in the United States. His dramas include: 'Sigurd Jorsalfar' (1872); 'Mary Stuart in Scotland' (1864); 'The Newly Wedded Pair' (1866); 'Sigurd Slembe' (1872); 'The Editor' (1874); 'A Bankruptcy' (1875); 'The King' (1877); 'Leonarda' (1879); 'The New System' (1879); 'A Glove' (1883); 'Beyond Our Strength' (1883); 'Geography and Love' (1885). His verse includes: 'Poems and Songs' (1870); 'Arnlot Gilline', an epic (1870). Besides the pastoral tales: 'Arne' (1858); 'A Happy Boy' (1860); 'The Fisher Maiden' (1868); 'Synnøve Solbakken', he has written the novels: 'The Bridal March' (1873); 'Magnhild' (1877); 'Captain Mansana' (1879); 'The Heritage of the Kurts' (1884); 'In God's Way' (1889); 'Absalom's Hair'; etc. See Boyesen, 'Essays on Scandinavian Literature' (1895); Gosse, 'An Essay on the Writings of Björnson' (1895); Brandes, 'Moderne Geister' (1897).

Bjornstjerna, byërn'shër-na, Magnus Frederick Ferdinand, mäg-noos frëd'er-ik fër'-de-nand (COUNT), Swedish statesman and author: b. Dresden, 10 Oct. 1779; d. Stockholm, 6 Oct. 1847. He was educated in Germany, and in 1793 proceeded to Sweden to enter the army. At the storming of Dessau he received a severe contusion from a cannon-ball, but he was able, notwithstanding, to be present at the battle of Leipsic. He afterward concluded the capitulation of Lübeck with Gen. Lallemand, and received the surrender of the fortress of Maestricht. He concluded with Prince Christian Frederick at Moss the convention which was followed by the union of Norway and Sweden. He published 'The British Rule in the East Indies' and 'Theogony, Philosophy, and Cosmogony of the Hindoos' (1843).

Blacas, Pierre Louis Jean Casimir, blä-ka, pe-är loo-e zhôn (DUC DE), French statesman: b. Aups, Var., 12 Jan. 1771; d. Kirchburg, Austria, 17 Nov. 1839. He was cabinet minister in the time of Louis XVIII., and a confidential adviser of the Bourbons; twice minister to Naples; ambassador to Rome to negotiate the concordat of 1817; went into exile upon the banishment of Charles X.; and offered the king his fortune, which was not accepted. He was so

BLACK

faithful to the Bourbons as to be unpopular with the people. He was a large collector of antiquities and founded the Egyptian Museum at Paris.

Black, Adam, Scotch publisher: b. Edinburgh, 20 Feb. 1784; d. there, 24 Jan. 1874. In 1808 he began business as a bookseller, and later with his nephew, Charles B. Black, established a publishing house in Edinburgh. Their most famous publications were: 'Encyclopædia Britannica,' and the 'Waverly Novels.' Adam Black was twice lord provost of Edinburgh, and in 1856-65 represented that city in Parliament. He declined the honor of knighthood, and a statue was erected in Edinburgh in recognition of his public services in 1877.

Black, Alexander, American author: b. New York, 7 Feb. 1859. He has published 'The Story of Ohio' (1888); 'Photography Indoors and Out' (1894); 'Miss Jerry' (1895); 'A Capital Courtship' (1897); 'Miss America' (1898); 'Modern Daughters' (1899); 'The Girl and the Guardsman' (1900).

Black, Charles Clarke, American lawyer: b. Mount Holly, N. J., 29 July 1858. He studied law and was admitted to the New Jersey bar in 1881. He has since practised in Jersey City, and has published 'Proof and Pleadings in Accident Cases' (1886); 'New Jersey Law of Taxation' (1893); 'Law and Practice in Accident Cases' (1900).

Black, Frank Swett, American lawyer: b. Limington, Me., 8 March 1853. He graduated at Dartmouth College in 1875; was editor of the *Journal* in Johnstown, N. Y.; studied law at Troy in the office of Robertson & Foster, and was admitted to the bar in 1879. He won much popularity by his activity in prosecuting the men who murdered Robert Ross in the election riots in Troy in 1892. In 1895-7, he was a member of Congress, and in 1897-9 governor of New York.

Black, James, American prohibitionist: b. Lewisburg, Pa., 23 Sept. 1823; d. 16 Dec. 1893. He joined a temperance society at the age of 17, and throughout his life was a determined advocate of prohibition and legislation for its enforcement. He was the first to propose the formation of a temperance party, was one of the committee that called a national convention to organize the Prohibition party (q.v.) and was elected its president when the convention met in Chicago, 1 Sept. 1869. At the Columbus, Ohio, convention, 22 Feb. 1872, he was made the first nominee of the party for President of the United States. His ticket received 5,608 votes in the election of that year. He published: 'Is There a Necessity for a Prohibition Party?' (1876); 'History of the Prohibition Party' (1880); 'The Prohibition Party' (1885).

Black, Jeremiah Sullivan, American jurist and statesman: b. Glades, Somerset county, Pa., 10 Jan. 1810; d. York, Pa., 19 Aug. 1883. At 17 years of age he entered the law office of Chauncey Forward, in Somerset, an eminent member of the bar, and was admitted to the courts in 1830, being still in his minority. In April, 1842, he was appointed by the governor president judge of the judicial district in which he resided, and confirmed by the Senate upon a strict party vote. In 1851, when a change in the

State Constitution made the judges elective, he was nominated as judge of the Supreme Court by the Democratic convention, before which he was not a candidate. Of the 10 candidates named by the two parties, he obtained the largest popular vote. Under the mode of drawing provided by the Constitution, a three years' term was assigned to him, and he became chief justice of the court. In 1854 he was re-elected to this place, by a majority of 47,000 votes, though the candidate for Governor on the same ticket was defeated by 37,000. On 5 March 1857, while engaged in the discharge of his judicial duties at Philadelphia, he received a telegraphic despatch from President Buchanan, tendering him the appointment of Attorney-General of the United States. He soon after appeared on behalf of the government, in a disputed land claim from California, involving an important principle upon which hundreds of similar cases depended. He achieved a great success, at once becoming famous as a jurist.

In December, 1860, Mr. Black succeeded Mr. Cass as Secretary of State. After the election of Lincoln, Judge Black retired to his law practice. In 1868, he was counsel for President Johnson in the famous impeachment trial. In 1877 he appeared as counsel for S. J. Tilden before the Electoral Commission. Besides a great jurist, Judge Black was a brilliant conversationalist, classical scholar, and powerful orator. His collected 'Essays and Speeches' were published in 1885.

Black, John Charles, American lawyer, soldier, and statesman: b. Lexington, Miss., 27 Jan. 1839. He entered the Union army in 1861 as colonel of the 37th Illinois Volunteers; was severely wounded in the service; and was brevetted brigadier-general. After the war he was elected Congressman-at-large from Illinois; was appointed commissioner of pensions by President Cleveland during the latter's first term, and United States attorney for the northern district of Illinois during his second term.

Black, Joseph, Scottish chemist: b. Bordeaux, France, 1728; d. Edinburgh, 6 Dec. 1799. He studied medicine, and in 1754 delivered a thesis, 'De Humore Acido a Cibis Orto et Magnesie Alba,' in which he ascribes the difference between the mild and caustic alkalies to the presence of fixed air (carbonic acid) in the former. The discovery of carbonic acid is of interest not only as having preceded the other gases made by Priestley, Cavendish, and others, but as having preceded in its method the explanation given by Lavoisier of the part played by oxygen in combustion. In 1756 he was appointed professor of medicine and lecturer on chemistry in the University at Glasgow; and in 1766 to the same chair in Edinburgh. No teacher inspired his disciples with such a zeal for study; his lectures, therefore, contributed much to make the taste for chemical science general in England. Upon Lavoisier's proposal, the Academy of Sciences in Paris appointed him one of its eight foreign members. Black did not adopt the Lavoisierian system until he was satisfied that it was more accurate than that of which he had been so long a teacher. In his later courses, however, he taught the anti-phlogistic system. His 'Lectures on Chemistry' appeared in 1803.

BLACK — BLACK-BELLIED PLOVER

Black, William, Scottish novelist: b. Glasgow, 13 Nov. 1841; d. Brighton, England, 10 Dec. 1898. He first studied art, but eventually became connected with the Glasgow press. In 1864 he went to London, and in the following year joined the staff of the *Morning Star*, for which he was special correspondent during the Austro-Prussian war of 1866. His first novel, 'Love or Marriage' (1868), was only moderately successful, but his 'In Silk Attire' (1869), 'Kilmeny' (1870), 'The Monarch of Mincing Lane,' and especially 'A Daughter of Heth' (1871), gained him an increasingly wide circle of readers. For four or five years he was assistant editor of the *Daily News*, but in 1874 his connection with journalism practically ceased. His other works include: 'The Strange Adventures of a Pheton' (1872), containing descriptions of scenery much praised by Ruskin; 'A Princess of Thule' (1873); 'The Maid of Killeena' (1874); 'Three Feathers' (1875); 'Madcap Violet' (1876); 'Green Pastures and Piccadilly' (1877); 'MacLeod of Dare' (1878); 'White Wings, a Yachting Romance' (1880); 'Sunrise' (1880); 'The Beautiful Wretch' (1881); 'Shandon Bells' (1883); 'Judith Shakespeare' (1884); 'White Heather' (1885); 'Sabina Zembra' (1887); 'The Strange Adventures of a House-Boat' (1888); 'In Far Lochaber' (1889); 'The New Prince Fortunatus' (1890); 'Wolfenberg' (1892); 'Highland Cousins' (1894); 'Briseis' (1896); and 'Wild Eelin' (1898). Black's novels have enjoyed much popularity especially in the United States. His subjects are drawn from many lands, but it is in dealing with the Scottish Highlands that he is at his best. He also wrote a 'Life of Goldsmith' for the English Men of Letters series. See Wemyss Reid, 'William Black, Novelist' (1902).

Black Acts, Acts of the Scottish Parliaments from 1424 to 1594, so called from their being printed in black-letter. The term "Black Act" is also applied to an act of George I. with reference to the "Blacks," a body of armed deer-stealers and poachers, who infested Epping Forest.

Black and Tan Terrier. See TERRIERS.

Black Art, the art or pretended art or practice of producing wonderful effects by the aid of superhuman beings or of departed spirits or the occult powers of nature. The reason why it was called black was that proficients in it were supposed to be in league with the powers of darkness. A large proportion of magical rites are connected with the religious beliefs of those using them, their efficacy being ascribed to supernatural beings. There is, however, a non-spiritual element in magic which depends on certain imagined powers and correspondences in nature, that can be utilized in various ways. In savage countries the native magician is often sorcerer and priest, and sometimes chief of the tribe. Among the ancient Egyptians magic was worked into an elaborate system and ritual, and it was regularly practised among the Babylonians and Assyrians, as well as in Greece and Rome. Alexandria, from the 2d to the 4th century, became the headquarters of theurgic magic, in which invocations, sacrifices, diagrams, talismans, etc., were systematically employed. This system, influenced by Jewish magical speculation, had a strong hold in

medieval Europe, and many distinguished names are found among its students and professors. The magic which still holds a place among the illiterate and ignorant classes has come down by tradition in popular folk-lore. The name natural magic has been given to the art of applying natural causes to produce surprising effects. It includes the art of performing tricks and exhibiting illusions by means of apparatus, the performances of automaton figures, etc. See ALCHEMY; ASTROLOGY; CHARM; DIVINATION; LEGERDEMAIN; WITCHCRAFT.

Black Ash, a mixture of 25 per cent of caustic soda with calcium sulphide, quicklime, and unburnt coal, obtained in the process of making sodium carbonate. The mixture of sodium sulphate, chalk, and powdered coal is fused in a furnace, gases escape, and the residue is the black ash, which is lixiviated with warm water, and the solution, evaporated to dryness, yields soda ash, an impure sodium carbonate. See SODIUM.

Black Assize, a judicial sitting of the courts held at Oxford in 1577, and rendered historical by the pestilential and deadly fever which was introduced into the court from the jail, and swept away judges, jurymen, and counsel, and extended itself into the town and neighborhood. The superstitions of the age invested it with a special character, and it was remarked that no women nor poor people died of it.

Black Bass, Duck, etc. See BASS; DUCK.

Black Beauty, His Grooms and Companions, a story by Anna Sewall. It is written in the form of a horse autobiography, and is really a tract on the proper treatment of horses. The story is told with simplicity and restraint, and its vogue has been great, and its influence very wide.

Black Beetle, the English name for a cockroach, especially the Oriental cockroach (q.v.); also less commonly for the dark-colored beetles of the bad-smelling genus *Blaps*.

Black-bellied Plover, or **Black-breast**, one of the largest of the American plovers (*Charadrius squatarola*), also known throughout the northern parts of the Old World, where it is known as "gray" or "Swiss" plover, and whence it goes in winter to all parts of the southern hemisphere. It breeds in the Arctic regions, and is known in the United States only in its spring and fall migrations which are carried along the coasts, so that the bird is rare throughout the interior. Great flocks sometimes visit England in autumn, spreading over cultivated fields, and remaining until the coming of frost. It is about 11.50 inches in length, and has a large round head, and large eyes, whence the gunner's names, "bullhead," "beetlehead," and "ox-eye." In general form it resembles the golden plover (q.v.), but has a distinct though small hind toe. The general aspect is gray, dusky on the back, with the throat, breast, and a large part of the abdomen black, and the tail barred with black; bill and feet black. It is a favorite object of sport, and the young migrants in autumn are delicious eating; but it is not as easily shot as most of the shore-birds. It breeds along the shores of the Arctic Ocean.

BLACK BELT—BLACK EARTH

Black Belt, an agricultural region of Alabama: 70 miles wide, extending entirely across the State, between 33° and 31° 40'; so called from the fact that the negroes greatly predominate in numbers, raising vast quantities of cotton from the richest of lands. It includes 17 counties, with over 500,000 inhabitants.

Black-cap, the name of various birds having the crown of their head black. In the United States it is given most often to the common titmouse, the chickadee (q.v.); and to a small fly-catching warbler, *Sylvania pusilla*, an olive and yellow bird with the top of the head crested with black. In England the common "black-cap" (*Curruca atricapilla*) is a small warbler, closely related to the nightingale, and one of the sweetest of European song-birds, which is frequently kept in cages.

Black Cat, an American fur-bearing animal.

Black Cockade, a badge first worn by the American soldiers during the Revolution, and later, during the hostility toward France occasioned by the X. Y. Z. Correspondence (q.v.), adopted by the Federalists as a patriotic emblem and as a rejoinder to the tri-colored cockade worn by the Republicans as a mark of affection toward France.

Black Co'hosh. See CIMICIFUGA.

Black Death, The, one of the most memorable of the epidemics of the Middle Ages, was a great pestilence in the 14th century, which devastated Asia, Europe and Africa. It was an Oriental plague, marked by inflammatory boils and tumors of the glands, such as break out in no other febrile disease. On account of these boils, and from the black spots (indicative of putrid decomposition) which appeared upon the skin, it has been generally called the Black Death. The symptoms were many, though all were not found in every case. Tumors and abscesses were found on the arms and thighs of those affected, and smaller boils on all parts of the body; black spots broke out on all parts of the skin, either single, united, or confluent. Symptoms of cephalic affection were frequent; many patients became stupefied and fell into a deep sleep, losing also their speech from palsy of the tongue; others remained sleepless, without rest. The fauces and tongue were black, and as if suffused with blood. No beverage would assuage the burning thirst. The plague spread with the greater fury as it communicated from the sick to the healthy; contact with the clothes or other articles which had been used by the infected induced disease, and even the breath of the sick, who expectorated blood, caused contagion far and near. As it advanced, not only men but animals fell sick and expired. In England the plague first broke out in the county of Dorset, whence it advanced through the counties of Devon and Somerset to Bristol, and thence reached Gloucester, Oxford and London. Probably few places escaped, perhaps not any, for the annals of contemporaries report that throughout the land only a tenth part of the inhabitants remained alive. From England the contagion was carried by a ship to Norway, where the plague broke out in its most frightful form, with vomiting of blood, and throughout the whole country spared not one third. The sailors found no refuge on their ships, and vessels whose crews had perished to the last man

were often seen drifting on shore. The whole period of time during which the Black Death raged with destructive violence in Europe was (with the exception of Russia, where it did not break out until 1351) from 1347 to 1350; from this latter date to 1383 there were various pestilences, bad enough, indeed, but not as violent as the Black Death. Ireland was much less heavily visited than England, and the disease seems scarcely to have reached the mountainous regions of that land; and Scotland, too, would perhaps have remained free from it had not the Scotch availed themselves of the discomfiture of the English to make an irruption into England, which terminated in the destruction of their army by the plague and the sword and the extension of the pestilence through those who escaped over the whole country. It may be assumed that Europe lost by the Black Death some 25,000,000 of people, or about one fourth of her entire population. That her nations could recover so quickly from this terrible loss without retrograding more than they did is a most convincing proof of the indestructibility of human society as a whole. In Hungary, and afterward in Germany, rose the brotherhood of the Flagellants, who undertook to expiate the sins of the people and avert the pestilence by self-imposed sufferings. While the wanderings of the Flagellants threw society into confusion, and helped to spread the plague, the horrors of the time were further heightened by the fearful persecutions to which the Jews were subjected, from a popular belief that the pestilence was owing to their poisoning the public wells. The people rose to exterminate the Hebrew race, of whom, in Mayence alone, 12,000 were cruelly murdered. They were killed by fire and by torture wherever they could be found, and for them to the terrors of the plague were added those of a populace everywhere infuriated against them. In some places the Jewish people immolated themselves in masses; in others, not a soul of them survived the assaults of their enemies. No adequate notion can be conveyed of these horrors. To aggravate the pestilence, the poison-panic made the people shut up their wells. With terror of poison and of plague in a state of society rude at the best, but now disorganized, what means were available to mitigate or prevent the sufferings of the people were rendered altogether nugatory.

Black Duck. See DUSKY DUCK.

Black Earth, a deposit in South Russia, extending over the steppes that border on the Black Sea, and the depressed area to the north of the Caspian, with a breadth from north to south of from 200 or 300 to nearly 700 miles. It varies in color from dark brown to black, and in thickness from a foot or two up to six or seven yards, occasionally reaching, it is said, even to 60 feet. It is composed chiefly of siliceous sand (about 70 per cent), alumina and other ingredients (23 per cent), and organic matter (about seven per cent). It appears to be unfossiliferous. It bears the same relation to the glacial accumulations of Russia that the loess of the Rhine, the Danube, etc., does to those of central Europe, and is probably the fine-grained silt derived from the torrents and flooded rivers that escaped from the melting snows and glaciers of the glacial period. According to some geologists, however, it may

BLACK-EYED SUSAN—BLACK FRIDAY

owe its origin to the action of the wind. It is supposed by them to be simply an accumulation of wind-blown dust—the finely sifted material being fixed by the abundant grasses of those steppe regions.

Black-eyed Susan, the name of a once popular comedy by Douglas Jerrold. It appeared in 1829 and was founded on Gay's ballad 'Sweet William's Farewell to Black-Eyed Susan.'

Black Flags, an organization of Chinese rebels who established themselves in the Red River valley in Tonquin, after the suppression of the Taiping Rebellion in southern China (1850-4). From their warlike character and desperate deeds they were called Black Flags as distinguished from the peaceable Yellow Flags. They assisted the Tonquinese and Chinese in opposing the French wars (1873, 1882, and 1885), with signal results. Their principal object was plunder. They were responsible for the appalling massacre, in 1884, of French missionaries and native Christians, to the number of 10,000.

Black Fly, a species of the genus *Simulium*, the common black fly of northern New England, Canada, and Labrador probably being *S. molestum*. In this tormenter of travelers and fishermen the body is short and thick, the labrum is free, sharp as a dagger, and the proboscis is well developed and draws blood profusely. It is black, with a broad silvery ring on the legs. The species are numerous.

The cylindrical larva is furnished with short antennæ, and near the mouth are two flabelliform appendages. The pupa has eight very long lateral filaments on the front of the thorax, and the posterior end of the body is enclosed in a semi-oval membranous cocoon, open in front, and posteriorly attached to some submerged plant such as eel-grass. The fly leaves the pupa beneath the water. She deposits her eggs on the rocks in a compact layer a few inches above the surface of the water. The eggs of the Hungarian or "Columbaz midge" are enveloped in a yellowish-white slime and deposited at the end of May or early in June upon stones or grass over which water flows, or in the brooks of the more elevated regions. The number laid is variously estimated at from 500 to 5,000. The food of the larva of the buffalo-gnat has been proved to be carnivorous, and it is supposed that the larvæ of all the species live on animal matter, though possibly in some cases on dead leaves. On hatching the larvæ become attached to plants, etc., or to each other, by a silken thread, forming long floating strings. When the fly issues from the submerged pupa-case she rises to the surface, then being protected by a fine silky covering of hairs. The adult fly in central New York issues about the first of April, and those apparently of a new brood the first of June; after this there is a succession of generations throughout the season; the development of a single brood occupying about two months. The larva hibernates.

While the black fly of Maine, and presumably of Labrador, is of the species *S. molestum*, that of the St. Lawrence valley has been named *S. invenustum*, and is said to be different from that of Lake Superior. A remarkably large species is known as *S. pictipes*; its larvæ

and pupæ were found in the rapids of the Au Sable River, and also similar ones on the north shore of Lake Superior.

The black fly is mostly active in the bright sun-light, mostly disappearing on cloudy days, but it is known to crawl under one's clothes and to bite in the night. The bite is often severe, the creature leaving a large clot of blood behind it. The best preventive is oil of tar, and the use of various ointments.

Black Forest (German, *Schwarzwald*), a chain of mountains in the grand-duchy of Baden and the kingdom of Württemberg. It runs almost parallel with the Rhine, from south to north, often only from 15 to 20 miles distant; is about 85 miles long, and from east to west in the southern part about 30 miles wide; in the northern about 18. The Danube, as well as many other rivers, rises in these mountains. Those on the west side run into the Rhine; those on the east side into the Danube. The Black Forest is rather a chain of elevated plains than of isolated peaks. The highest summit, the Feldberg, measures 4,900 English feet. Except from June to September, these mountains are generally covered with snow, and even during this period are not entirely free from it. Among the many valleys of this chain, the Murgthal is particularly celebrated for its beautiful scenery. The whole chain consists of primitive mountains: its skeleton throughout is granite; its higher points are covered with sandstone, and other layers of less consequence. On the western side, at the foot, appears gneiss. Porphyry and clay-slate are found on several heights, as likewise silver, lead, copper, iron, cobalt, and other minerals. The forests are extensive, and consist mostly of pines and similar species. The raising of cattle is the principal branch of husbandry carried on in this district. The ground is not fertile, and the inhabitants scattered over the mountains live very frugally, and are very industrious. The vast quantity of timber growing here has long been a considerable source of revenue. The timber of the Black Forest was always highly prized by the Dutch, and the export to Holland is still largely carried on, the trees being conveyed down the Rhine in the form of rafts. Many saw-mills are kept at work cutting up the timber; and the forests also give employment to charcoal-burners, potash-boilers, etc. The manufacture of the well-known wooden clocks, toys, etc., is another important branch of industry, in which many persons are employed. Watches are also made, as well as orchestrions and other musical instruments. Neustadt, Friberg, Hornberg, and Furtwangen are central points of the manufacture of wooden wares, the commerce in which embraces all Europe, and extends to America and Australia.

Black Friars, friars of the Dominican order: so called from the color of their habit. See DOMINICANS; ORDERS, RELIGIOUS.

Black Friday, the name given in the United States to two days that ushered in financial panics. First, Friday, 24 Sept. 1869, when the attempt of Jay Gould and James Fisk, Jr., to create a corner in the gold market by buying all the gold in the banks of New York city, amounting to \$15,000,000, culminated. For several days the value of gold had risen steadily, and the speculators aimed to carry it from 144 to 200. Friday the whole city was in a ferment.

BLACK GUM—BLACK HOLE OF CALCUTTA

the banks were rapidly selling, gold was at 162½, and still rising. Men became insane, and everywhere the wildest excitement raged, for it seemed probable that the business houses must be closed, from ignorance of the prices to be charged for their goods. But in the midst of the panic it was reported that Secretary Boutwell of the United States treasury had thrown \$4,000,000 on the market, and at once gold fell, the excitement ceased, leaving Gould and Fisk the winners of \$11,000,000. The second was 19 Sept. 1873, when numerous failures on the New York Stock Exchange precipitated the panic of 1873.

The term was first used in England, being applied in the first instance to the Friday on which the news reached London, 6 Dec. 1745, that the young pretender, Charles Edward, had arrived at Derby, creating a terrible panic; and finally to 11 May 1866, when the failure of Overend, Gurney & Company, London, the day before was followed by a widespread financial ruin. Good Friday is also known as Black Friday in some countries, because of the use of black vestments and draperies in the churches.

Black Gum, Sour Gum, or Pepperidge. See TUPELO.

Black Hawk, chief of the Sac Indians: b. Kaskaskia, Ill., 1767; d. near Fort Des Moines, 3 Oct. 1838. He was made chief of the Sacs in 1788; and in 1804 repudiated the first agreement made by the Sacs and Foxes with the United States to give up their lands east of the Mississippi. The possession of the territory was disputed for a number of years; in 1823 the majority of the two tribes moved across the river, and a treaty with the United States, ceding the disputed territory, was signed in 1830. Black Hawk, however, objected to the whites occupying the vacated territory, and in June 1831, he began the Black Hawk war by crossing the Mississippi with a small force and attacking some Illinois villages. Driven off by the militia under Gen. Gaines, he returned in the spring of 1832 with a larger force and began to massacre the white settlers. The Indians were however defeated by United States troops in two battles near the Wisconsin River, 21 July 1832, and near the Bad-Axe River, 1-2 Aug. 1832. The war was brought to an end by the surrender of Black Hawk in the latter part of August. He was kept a prisoner till 1833, then rejoined his tribe on their reservation, near Fort Des Moines.

Bibliography.—Drake, 'Life of Black Hawk'; Patterson, 'Life of Black Hawk'; Snelling, 'Life of Black Hawk'; Thwaite, 'Story of the Black Hawk War' (Wisconsin Historical Society 'Papers' Vol. XII.).

Black-Hawk War. See BLACK HAWK.

Black Hills, a region in South Dakota, extending into Wyoming. It was purchased from the Indians in 1876, for whom it had been one of the finest hunting grounds in the West. In 1877-8 thousands of miners went there, and in 1880 there had already sprung into existence three towns, Deadwood, Central City, and Leadville. Around these lay also groups of smaller towns and villages. From 1880 the gold mines yielded about \$4,000,000 annually, and the silver mines about \$3,000,000 annually. The region is also rich in copper, lead, iron and mica. The

soil is fertile and the hills have abundant facilities for the grazing of cattle. Thrifty farmers have settled there, and many of them have good farms and fine improvements. Good school-houses have also been built in different settlements. See SOUTH DAKOTA.

Black Hole of Calcutta, a small chamber, 20 feet square, in Fort William, Calcutta. On the capture of Calcutta by Surajah Dowlah, 20 June, 1756, the English garrison, consisting of 146 men, under the command of Mr. Holwell, were locked up for the night in the common dungeon of the fortress, a strongly barred room, 18 feet square, and never intended for the confinement of more than two or three men at a time. There were only two windows, and a projecting veranda outside and thick iron bars within materially impeded what little ventilation there might be, while conflagrations raging in different parts of the fort gave the atmosphere an unusual oppressiveness. The unhappy creatures, exhausted with previous fatigue, were packed so tightly in their prison that it was with difficulty the door could be closed. A few moments sufficed to throw them into a profuse perspiration, the natural consequence of which was a raging thirst. One of the soldiers stationed in the veranda was offered 1,000 rupees to have them removed to a larger room. He went away, but returned saying it was impossible. The bribe was then doubled, and he made a second attempt with a like result: the nabob was asleep, and no one dared wake him. By nine o'clock several had died, and many more were delirious. A frantic cry for water now became general, and one of the guards, more compassionate than his fellows, caused some to be brought to the bars, where Mr. Holwell and two or three others received it in their hats, and passed it on to the men behind. In their impatience to secure it nearly all was spilt, and the little they drank seemed only to increase their thirst. Self-control was soon lost: those in remote parts of the room struggled to reach the window, and a fearful tumult ensued, in which the weakest were trampled or pressed to death. They raved, fought, prayed, blasphemed, and many then fell exhausted on the floor, where suffocation put an end to their torments. About 11 o'clock the prisoners began to drop off fast. At length, at six in the morning, Surajah Dowlah awoke, and ordered the door to be opened. Of the 146 only 23, including Mr. Holwell (from whose narrative, published in the 'Annual Register' for 1758, the account of this event is partly derived), remained alive, and they were either stupefied or raving. Fresh air soon revived them, and the commander was then taken before the nabob, who expressed no regret for what had occurred, and gave no other sign of sympathy than ordering the Englishman a chair and a glass of water. Notwithstanding this indifference, Mr. Holwell and some others acquit him of any intention of causing the catastrophe, and ascribe it to the malice of certain inferior officers, but many think this opinion unfounded. Holwell and three others were sent prisoners to Muxadavad; the rest of the survivors obtained their liberty, and the dead bodies were carelessly thrown into a ditch. The Black Hole is now used as a warehouse, and an obelisk, 50 feet high, was erected in memory of the victims.

BLACK JACK—BLACK RIVER

Black Jack. 1. A term loosely applied by miners to blende, the sulphuret of zinc, or to any other ore which resembles it in being obnoxious to them, if in no other respect.

2. One of several small oak trees of the southeastern coast, especially *Quercus Marylandica*, which has a rough, dark, scaly bark, and peculiar broadly wedge-shaped 3-5 lobed leaves, dark green and lustrous above, and somewhat rusty beneath.

Black Knight, The, a name given by romantic writers to various heroic characters. In Scott's 'Ivanhoe' Richard Cœur de Lion masquerades as the Black Knight. The Knight Esplandian, son of Amadis of Gaul and Oriana, is also so called. In the Arthurian legend the Black Knight, Sir Percival, was one of the four brothers who kept the passage of Castle Dangerous.

Black Law, in the United States the name given to certain laws in force before the Civil War in many of the northern and border States discriminating against free negroes who might become citizens. Such laws excluded negroes from the public schools and from the militia, forbade them to testify in court against a white man, or in any case in which a white man was interested.

Black Lead. See GRAPHITE.

Black Letter, that variety of type otherwise designated Gothic, and which in a modified form is the ordinary type made use of in Germany, although in recent years there has been a tendency to employ the Roman letter, the Gothic type being considered injurious to the eyes. The earliest printed books were in black letter. See PRINTING.

Black Lilly. See FRITILLARY.

Black List, a list of bankrupts or other persons whose names are officially known as failing to meet pecuniary engagements. The term is also applied to a list of employees who have been discharged by a firm or corporation and against whom some objection is made and reported to other firms or corporations to prevent them obtaining employment. Blacklisting is made a punishable offense by the laws of some States. See Eddy, 'Laws of Combinations' (1901).

Black Monday. (1) A name for Easter Monday, in remembrance of the dreadful experiences of the army of Edward III., before Paris, on Easter Monday 14 April 1360. Many soldiers and horses perished from the extreme cold. (2) The 27th of February, 1865, a memorable day in Melbourne, Australia, when a destructive sirocco prevailed in the surrounding country.

Black Mountains, the culminating group of the Appalachian system, named from the dark growth of balsam-firs and other evergreens which cover their summits. Their position is in Yancey and Buncombe counties, North Carolina, between the main central ridges on the west and a portion of the Blue Ridge on the east. Unlike the other ridges of the Alleghanies, they lie for the most part transverse to the general trend of the range, and give this direction to the great valleys and rivers included between them. They rise from a district of great elevation, the height of the valley at Asheville, on the French Broad River, being about 2,000 feet above the sea, and that of Toe River, at Burns-

ville, Yancey County, about 2,500 feet. From this plateau the drainage is toward the Ohio in a northerly direction by the branches of the Great Kanawha, by those of the Holston and the French Broad toward the southwest, and by those of the Yadkin and the Catawba into the Pedee and Santee toward the southeast. This position at the sources of streams flowing in such diverse directions, long since pointed out this district as probably the most elevated east of the Rocky Mountains. The chief peaks are Mitchell, 6,710, and Clingman's Peak, Guyot's Peak, or Balsam Cone, Sandoz Knob, Hairy Bear, Cat Tail Peak, Gibbe's Peak, Sugar Loaf, or Hallback Peak, Potato Top, Black Knob, Bowler's Pyramid, Roan Mountain, all of which are above 6,500 feet in height.

Black Prince (EDWARD, PRINCE OF WALES), the son of Edward III. of England. He is thus styled in history by reason of the color of his armor. He died in 1376 and his son became king in 1377 as Richard II.

Black-quarter, an apoplectic disease which attacks cattle, indicated by lameness of the fore-foot, one of the limbs swelling, and after death being suffused with black blood, which also is found throughout the body. The disease, which chiefly attacks young cattle, is due to undrained fertile pasture, or to the too rapid transference of the cattle from poorer to richer soils. It is difficult to cure, but may be prevented by thorough draining or by giving regular doses of nitre to all the animals. The usual treatment consists in blood-letting, cutting into the swollen parts, and administering first nitre and afterward ammonium acetate and purgatives. In the United States the disease is especially prevalent in Texas, Kansas, Nebraska, South Dakota, and Colorado.

Black Republic, a name applied to the Republic of Haiti, which is under the dominion of the African race.

Black Republicans, a name applied to those members of the Republican party, who resisted the introduction of slavery into any State where it was not already recognized.

Black River, the name of several American rivers. (1) A river which rises in New York in Herkimer County, and after passing through Oneida and Lewis counties, changes its course at a place called Great Bend, passes by Watertown, and flows through Black River Bay into Lake Ontario. Near Turin, in Lewis County, it has a fall of about 63 feet. Below the fall, it is navigable to Carthage, a distance of 40 miles. The whole length of the river is 125 miles, and its breadth at Watertown (six miles from its mouth) is 60 yards. (2) A river of Missouri and Arkansas, also known as the Big Black River, the largest affluent of White River. It rises in the southeastern part of the former State, takes a southerly course, enters Arkansas, and joins the White River 40 miles below Batesville. During nine months of the year it is navigable for a distance of 100 miles from its mouth. Its entire length is about 400 miles. Trout and other excellent fish are caught in its waters in great abundance. (3) A river of Wisconsin. It rises in Marathon County and enters the Mississippi 15 miles above La Crosse, after a course of 225 miles. (4) A river of Vermont which rises in the town of Plymouth and

BLACK RIVER FALLS—BLACKADDER

is a tributary of the Connecticut. Its abundant water power is utilized by various manufacturing along its course. (5) A portion of the Washita River in Louisiana between the mouth of the Tensaw River and the Red River; also sometimes styled Black River.

Black River Falls, Wis., a city and the county-seat of Jackson County, 171 miles north of Milwaukee. A fine water power is afforded by the falls of the Black River, and there are flour and lumber mills, wagon and other factories, foundries, machine shops, and nurseries. There are iron mines in the neighborhood, and kaolin deposits from which fire-brick are manufactured. Pop. (1900) 1,938.

Black Rock Desert, a tract of nearly 1,000 square miles, north of Pyramid Lake, in Nevada. In summer it is a barren level of alkali and in winter covered in places with shallow water. Called also "Mud Lakes."

Black Rod, Usher of the, an officer of the House of Lords, appointed by letters patent from the Crown, and employed to execute orders for the commitment of parties guilty of breach of privilege and contempt, to assist at the introduction of peers and other ceremonies; and to summon the Commons to attend in the House of Lords when the royal assent is given to bills. His proper title is gentleman-usher of the black rod; that of his deputy, yeoman-usher.

Black Rood of Scotland, a cross of gold in the form of a casket, alleged to contain a piece of the true Cross. It was brought to Scotland in the 11th century by Margaret, queen of Malcolm III.; was bequeathed as an heirloom, and regarded as a sacred relic. It was delivered to Edward I. in 1291, but restored to Scotland after the Peace of Northampton in 1328. It was finally taken in battle by the English in 1346, and hung in the Cathedral of Durham until the Reformation, when it disappeared.

Black Saturday, 4 Aug. 1621; so called in Scotland because a violent storm occurred at the very moment the parliament was sitting to enforce episcopacy on the people. The name has also been applied to 10 Sept. 1547 on which date the disastrous battle of Pinkie was fought.

Black Sea (Lat. *Pontus Euxinus*), a sea situated between Europe and Asia, and bounded on the west by Turkey, Bulgaria, and Rumania, northwest, north and east by the Russian dominions, and on the south by Anatolia (Asia Minor), being connected with the Mediterranean by the Bosphorus, and with the Sea of Azov by the Strait of Yenikale. The area of the Black Sea and the Sea of Azov amounts to 168,500 square miles. The water is not so clear as that of the Mediterranean, and, on account of the many large rivers which fall into it,—the Danube, Dniester, Dnieper, Don, Kuban, etc.,—being less salt, freezes more readily. The tempests on this sea are sometimes tremendous in winter, as the land which confines its agitated waters gives to them a kind of whirling motion; but being practically clear of islands and rocks its navigation is not difficult on the whole. In 1854 one of its tremendous storms occasioned a very serious loss to the shipping of the allied British and French. The fisheries in the Sea of Azov and the Black Sea are not unimportant, various kinds of valuable fish both large and

small being taken; among others, several species of sturgeon. Caviare is made on the coast, as well as fish-glue, fish-oil, and, from the spawn of the sea mullet, botargo. The chief ports are Odessa, Kherson, Nicolaiev, Sebastopol, Novorossisk, Batoum, Trebizond, Samsun, Sinope, and Varna. It contains no islands of any note. After the capture of Constantinople (1453) the Turks excluded all but their own ships from the Black Sea till 1774, when the Russians obtained the right to trade in it, the same right being accorded to Austria in 1784, and to Britain and France in 1802. The preponderance thereafter gained by Russia was one of the causes of the Crimean war, by which she was compelled to cease keeping armed vessels on it, the sea being declared neutral by the Treaty of Paris in 1856. In 1871, however, the sea was deneutralized by a conference of the European powers (France being unrepresented) at London in response to a protest from Russia.

Black Tin, tin ore when dressed, stamped, and washed ready for smelting, forming a black powder. See TIN.

Black-vomit, a form of vomiting occurring usually in severe cases of yellow fever, due to the presence of blood in the stomach. See YELLOW FEVER.

Black Wad, an ore of manganese, used in making chlorine gas and as a drying ingredient in paints. It is an earthy variety of the dioxide found in low-lying districts, and is often mixed with oxides of cobalt or copper.

Black Walnut. See WALNUT.

Black Warrior, an American merchant vessel, seized and confiscated by Cuban customs officers in May 1854. This seizure was used as an excuse for proposed filibustering expeditions against Cuba. Spain, however, made compensation for the seizure.

Black Warrior, a river of Alabama, formed by the confluence of the Locust and Mulberry forks. It flows into the Tombigbee near Demopolis, after a course of 300 miles, and is navigable in its lower course to Tuscaloosa.

Black Watch, The, a famous British regiment, originating as a body of Highlanders, raised about 1668, for the purpose of keeping the peace in the Highlands, and so named from their dark dress. They were embodied in the regular army under the title of the 42d regiment in 1739. It first distinguished itself in the battle of Fontenoy (1745). From 1750 till 1767 the regiment was in America, and on its return it received the title of Royal Highlanders. It again served in America during the War of Independence; and in 1801 it particularly distinguished itself in Egypt at the battle of Alexandria. The Black Watch was also present at Napoleon's final defeat in the battle of Waterloo. It has gained special mention for its conduct at the Alma, in the Ashantee war, and at Tel-el-Kebir. The regiment was practically annihilated in the Boer war in 1901. Few English regiments surpass them for number of engagements or battle honors.

Black Water State, a popular nickname for Nebraska.

Blackadder, John, Scottish preacher: b. 1615; d. December 1685. He entered the Presbyterian ministry and when, in 1662, the episcopal

WHITE BLACKBERRY, "ICEBERG."

BLACKBERRY — BLACKBIRD

form of church government was forced upon a people who were generally repugnant to it, Blackadder, so far from complying with the new system, employed himself for several successive Sundays in exposing what he considered its unlawfulness, and, in his own words, entered his "dissent in heaven" against it. He was obliged to demit his charge in favor of an Episcopal incumbent, and in 1670, having performed worship at a conventicle near Dunfermline, where the people had armed themselves for self-defense, he was summoned before the privy council, but contrived to elude their power. On one occasion he preached at Kinkell, near St. Andrews; the people flocked from the metropolitan city to hear him, notwithstanding all the injunctions and surveillance of Archbishop Sharpe. It is said, that on Sharpe desiring the provost to send out the militia to disperse the congregation, he was informed that it was impossible—the militia had gone already as worshippers. After spending several months in Holland, in 1680 he returned to Scotland, and in the succeeding year was apprehended, and confined in the state prison upon the Bass Rock, where he died. See Crichton, 'Life of Blackadder' (1823).

Blackberry, various species of *Rubus* (q.v.), in which the drupelets adhere to the receptacle after ripening. Two general types are common: the trailing or dewberry (q.v.), and the upright, which is more generally known as the blackberry. The leading or representative species of this group is the very variable *R. nigrobaccus* (*R. villosus* of some botanists), which since 1841, when the first variety was introduced, has developed numerous varieties and has become in America, but not elsewhere, an important commercial fruit. It is used chiefly as a dessert fruit, but is also preserved, canned and evaporated. The plant thrives best on a northern slope and on rather heavy, loamy soils retentive of moisture but well drained. The soil must not be rich in nitrogenous food, since this tends to increase wood at the expense of fruitfulness. On light soils the plants are likely to suffer from lack of moisture in dry seasons. Potash fertilizers are required in abundance. Plants are usually propagated from root cuttings or suckers, and when one season old the smaller varieties are set in the field usually three by eight feet apart, the larger four by ten or else in checks six by six feet or more. When set in checks cultivation may be given both ways. For cultivation, diseases, etc., see RASPBERRY. In Europe the bramble (*R. fruticosus*) is called the blackberry. It is not extensively cultivated. Consult: Bailey and Miller, 'Cyclopædia of American Horticulture' (1900-2); Card, 'Bush Fruits' (1901).

Blackberry Lily (LEOPARD FLOWER) (*Bcl-amcanda punctata*), a perennial herb, out of the two species of its genus of the natural order *Iridaceæ*, native of Japan and China and long cultivated as a garden plant for its orange, red-spotted flowers. Its popular names were suggested by the blackberry-like clusters of roundish seeds and the spotted flowers. The seed stalks are occasionally used for decoration with dried grass. The seeds may be sown in a sunny place where the soil is light and rich, and in after years the root-stocks may be divided.

Blackbird, the name given to two distinct species of birds: (1) The American grakles (q.v.) of the family *Icteridæ*, which consists of about a dozen species differing in size and color. (2) The English song-thrush or "merle." Four species are known in the eastern States, namely: the purple grackle, and rusty grackle, the red-winged blackbird, and the cow-bird.

The most familiar American one is the crow-blackbird, more properly termed purple-grackle, because of the iridescent or metallic gloss on its plumage. This bird is found throughout the entire East, and as far west as Dakota. It is the largest variety, being 12 inches in length. In the spring flocks of these grakles are found among the advance guard of the returning hosts of the homeward-bound migrants, although many remain in the southern States throughout the entire winter season. Their nests, located along the edges of the swamps, are rude, strong structures of sticks and reeds, placed among the branches of bushes, in the tops of tall pine trees, or in holes of old tree-stumps. The eggs are remarkably varied in size, shape and color, some being pointed, others long and slender, while others are nearly globular, the length averaging about 1.25 by .90 of an inch. The color is any shade of dirty white, light-blue or green, and the markings consist of confused blotches, scratches, and straggling lines of various dark tints. A bird similar in its habits and mode of life to the purple-grackle is the rusty blackbird, lacking only the metallic hues, its plumage being rusty black. The marshes where they breed are great centres of blackbird population, and there they collect in great flocks of young and old as the end of the season approaches. At this time they visit any neighboring fields of Indian corn, sometimes in hordes, to tear open the husks, feed upon the milky kernels, and make themselves obnoxious to the farmers, although, indisputably, they are, on the whole, beneficial by their destruction of insects.

The red-winged blackbird (*Agelaius phoeniceus*), a variety of which is also found on the Pacific coast, varies in color from the bird of the eastern States, in the fact that it has on the wing a dark, blood-red patch, bordered with pure white, the other possessing only the scarlet patches on each shoulder, from which it takes its name. The nests of the red-winged blackbird are placed near the ground, among reeds or in small bushes and swamps. The eggs are smaller and lighter in color than those of the grackle, but resemble them in the scrawled markings. The French-Canadians call them "officer-birds." The impression upon the beholder, as he gazes at the prodigious flocks of tens of thousands of these red-eapauleted blackbirds, when gathered upon the marshes preparing for the fall migrations, and wheeling in regular lines as they fly, their epaulets glistening in the sun, is that of an army of soldiers. Besides these, there is found in the middle west the handsomest of the family, the yellow-headed blackbird (*Xanthocephalus xanthocephalus*), in which the whole head and throat are rich orange-yellow. The females of many species are strikingly contrasted in plumage to their mates, having only a streaked brown dress instead of glossy black and red or yellow of the males. The young resemble the females in their protected dullness of plumage. For the English Blackbird, see SONG THRUSH. For the cow-bird, see COW-BIRD.

BLACKBREAST—BLACKFISH

The name is given to various other birds, prevalingly black in plumage, as, for example, to the bobolink (q.v.), which is called "skunk blackbird," because of the resemblance in its black and white markings to those of a skunk; and to the ani of Florida and the West Indies, which is commonly termed "savanna blackbird."

See Baird, Brewer and Ridgway, 'North American Birds' (Boston 1874); Ingersoll, 'Wild Life of Orchard and Field' (1902).

Blackbreast, a local name among American sportsmen for (1) the black-bellied plover (*Charadrius squatarola*); (2) the dunlin (*Tringa alpina*), also called "blackheart."

Blackbuck, the common small antelope (*Antelope cervicapra*), of the plains of India and Assam. This is the typical antelope, with horns from 16 to 20 inches long, rising in an elegant spiral from the top of the head. The body is blackish brown above, sharply contrasted with white on the under parts, and with a conspicuous white ring around each eye. These handsome little antelopes go about ordinarily in family parties, but sometimes gather in large herds, and are a favorite object of sport in India, where they are usually chased on horseback with greyhounds—sometimes also with the cheeta (q.v.), or by the aid of falcons. They are so swift that the best of dogs are required to catch them. They continue numerous because they are never hunted by the native Hindus, on account of religious prejudices. Consult: Baker, 'Wild Beasts and Their Ways,' and other writers upon the sport and natural history of India.

Blackburn, Henry, English journalist and art critic: b. Portsea, 15 Feb. 1830. He was educated at King's College, London. Beside contributions to newspapers and magazines, he has written 'Life in Algeria' (1864); 'Art in the Mountains: the Story of the Passion Play in Bavaria' (1870); 'Breton Folk' (1879); etc.

Blackburn, Joseph Clay Styles, American lawyer: b. Woodford County, Ky., 1 Oct. 1838; was graduated at Centre College, Danville, Ky., in 1857; admitted to the bar in 1859, and practised in Chicago. During the Civil War he served in the Confederate army, and after the war resumed practice in Kentucky. In 1871 he was elected to the Kentucky legislature, and in 1874 to Congress; and was a United States Senator in 1885-97 and again elected for the term 1901-7. During the presidential campaign of 1896 he was a leader in the free coinage silver movement.

Blackburn, Luke Pryor, American physician: b. Fayette County, Ky., 16 June 1816; d. 14 Sept. 1887; was graduated at Transylvania University, Lexington, Ky., in 1834, and began practising in that city. When cholera broke out in the town of Versailles he went there and gave his services free during the epidemic. In 1846 he went to Natchez, Miss., and in 1848, when yellow fever appeared in New Orleans, as health officer of Natchez, he originated the first quarantine against New Orleans that had ever been known in the Mississippi valley. During the Civil War he was a surgeon on the staff of Gen. Price. In 1875, when yellow fever broke out in Memphis, he hastened to the city and organized a corps of physicians and nurses, and in 1878 gave his services to the yellow fever

sufferers at Hickman, Ky. He was elected governor of Kentucky in 1879. He founded the Blackburn Sanitarium for Nervous and Mental Diseases in 1884.

Blackburn, William Maxwell, American Presbyterian clergyman and educator: b. Carlisle, Ind., 31 Dec. 1828; d. 1900. He became president of the University of North Dakota in 1884 and of Pierre University, South Dakota, in 1885, and president-emeritus of the last (now Huron College) in 1898. He wrote 'St. Patrick and the Early Irish Church'; 'Admiral Coligny and the Rise of the Huguenots'; 'History of the Christian Church,' etc.; and the 'Uncle Alick' series of juvenile stories.

Blackburn, England, a municipal, parliamentary, and county borough in Lancashire, 21 miles north-northwest from Manchester. There is a free grammar school, founded by Queen Elizabeth in 1557; a free school for girls, founded by William Leyland in 1765; a technical school, and a free library. The town-hall, infirmary, exchange, municipal offices, county court, county police station, opera house, library and museum, and union workhouse are all modern and handsome buildings. There are two public parks, one beautifully situated on the declivity of Revidge Hill. The railways all converge, and pass through one large railway station belonging to the Lancashire & Y. Ry. Company. The corporation owns all the public utilities. Blackburn is one of the chief seats of the cotton manufacture, there being upward of 140 mills, as well as works for making cotton machinery and steam-engines. The cottons made in the town and vicinity have an annual value, of about \$25,000,000. Pop. (1901) 127,527.

Blackcock, or **Heathcock**, a large European grouse (*Tetrao tetrix*), so called because of the glossy black color of the cock. The female is grayish, mottled in darker colors, and is called "grayhen," or "heathhen." See CAPERCALLIE.

Blackfeet Indians, a tribe of Indians inhabiting the United States and Canada from the Yellowstone to Hudson Bay. They received this name from the fact that the first ones seen by white men wore leggings blackened by traveling over the burnt prairie. They call themselves "plainmen." At the end of the first quarter of the 19th century they numbered nearly 50,000. In 1903, less than 6,000 remained, of whom nearly half were on the reservation in Montana.

Blackfin. See BLUEFIN.

Blackfish, any one of a variety of dark-colored fishes, both of America and Europe. For the American "blackfish," see TAUTOG; SEABASS, and MINNOW. The English "blackfish" is a kind of mackerel (*Centrolophus niger*), about two feet long. It occurs rather abundantly off the south coast of Europe, and is much esteemed as a food fish.

The name is also given to a small "killer" whale of the genus *Globiocephalus*, which goes about in herds that often enter harbors. They are sought by fishermen for the sake of a small amount of oil, resembling sperm-oil, to be obtained from their fat, and also for the sake of their beef-like flesh. The common blackfish of the Atlantic is *G. brachypterus*, and that of the

BLACKGUARD—BLACKMAIL

North Pacific *G. scammoni*. Sailors give the name "blackfish" to the "caaing," or "pilot" whale (q.v.), and to various other small cetaceans. Consult: Bullen, 'Cruise of the Cachalot'; Scammon, 'Marine Mammals of North America.' See also KILLER.

Blackguard, a term used in the 16th century for the lowest menials of a noble house, the scullions who cleaned pots and pans. It was also used of the hangers-on of an army, camp followers, then a rabble, and to vagabonds in general.

Blackhead, the name for several animals, characterized by the blackness of the head; especially in the United States: (1) the scaup duck; (2) a common minnow, the fathead (q.v.). The name is also applied to the accumulations of dirt found in the sebaceous follicles. See ACARUS.

Blackheath, England, an elevated heath in the county of Kent. It borders on Greenwich Park, and is about five miles from St. Paul's, London. It contains 267 acres, and is a place of popular resort, much used for cricket-playing. In 1831 Wat Tyler and John Ball mustered their followers here. Jack Cade occupied the same position twice in 1450. In 1497 the Cornish insurgents, under Lord Audley, were routed there by the king's forces. Blackheath has been the scene of many historical pageants and processions, as it was formerly the custom for the mayor and corporation of the city of London, and even the king and court, to repair thither to meet illustrious foreigners from the Continent. Henry IV. met there (1400) the Byzantine emperor, Michael Palæologus; the corporation of London there met Henry V., on his return from Agincourt, and the year afterward, the Emperor Sigismund. The most splendid, and one of the last of all, was the reception of Anne of Cleves, by Henry VIII., January 1541; she was conducted through Greenwich Park to the palace at Greenwich, followed by prodigious numbers of nobility and gentry, and 1,200 privileged citizens, clad in velvet and chains of gold.

Blackhorse, a fish, one of the suckers of the Mississippi valley (*Cyprinus elongatus*); also known as the Missouri or gourdseed sucker. It is about two feet long, with a small head, suggesting, in profile, that of a horse, and becomes almost jet-black in spring. See SUCKER.

Blackie, John Stuart, Scottish poet, litterateur, and professor: b. Glasgow, 1809; d. 2 March 1895. He was educated at the universities of Aberdeen and Edinburgh; subsequently went to Göttingen, Berlin, and Rome, where he continued his studies, which were chiefly connected with philology. In 1834 he published a translation of Goethe's 'Faust,' and the same year became an advocate at the Scottish bar; in 1841 he accepted the chair of humanity in Marischal College, Aberdeen. This position he held until, in 1852, he was appointed to the professorship of Greek in the University of Edinburgh, a chair which he resigned in 1882. By his unwearied efforts to preserve the Gaelic language, he succeeded in raising \$60,000, with which sum a Celtic chair was endowed in Edinburgh University. Among his more important writings are: 'Lyric Poems'; 'Homer and the

Iliad'; 'Musa Burschicosa'; 'Horæ Hellenicæ'; 'Self-culture'; 'Songs of Religion and Life'; 'Lays of the Highlands and Islands'; 'Lay Sermons'; 'Altavona'; 'Wisdom of Goethe'; 'Life of Burns'; 'Scottish Song'; and 'Song of Heroes.' His biography has been published (2 vols.) by Anna M. Stoddart.

Blacking, the article employed in blacking boots and shoes, usually contains for its principal ingredients oil, vinegar, ivory, or bone black, sugar or molasses, and strong sulphuric acid, though every manufacturer has his own recipe, and endeavors to turn it to best account by concealing its composition and puffing its merits. Blacking is used either liquid or in the form of a paste, but both are obtained from the same ingredients, the only difference being that in making the paste a portion of the liquid is withheld. A celebrated old English blacking consists of 18 ounces of caoutchouc dissolved in 9 pounds of hot rape-oil, 60 pounds ivory-black, 45 pounds molasses, and 20 gallons vinegar, of strength No. 24, in which 1 pound finely ground gum-arabic has been dissolved. The whole mixture, after being carefully triturated in a grinding mill, receives 12 pounds sulphuric acid, in small successive quantities, stirring strongly for half an hour. The stirring is continued for half an hour daily during a fortnight, and then 3 pounds of gum-arabic are added, after which the stirring is resumed, and continued as before for another fortnight. This gives fine liquid blacking; the paste is obtained within a week by withholding 8 of the 20 gallons in which the gum-arabic is dissolved.

Blackleg, a cattle disease. See BLACK QUARTER.

Blackmail, originally a certain rate of money, corn, cattle, or the like, anciently paid, in the north of England and in Scotland, to certain men who were allied to robbers, to be protected by them from pillage. It was carried to such an extent as to become the subject of legislation. Blackmail was levied in the districts bordering the Highlands of Scotland till the middle of the 18th century. In the United States, in common language, and in general acceptance, it is equivalent to, and synonymous with, extortion—the exaction of money, either for the performance of a duty, the prevention of an injury, or the exercise of an influence. It supposes the service to be unlawful and the payment involuntary. Not unfrequently it is extorted by threats, or by operating upon the fears or the credulity or by promises to conceal, or offers to expose, the weaknesses, the follies, or the crimes of the victim. There is moral compulsion, which neither necessity nor fear, nor credulity can resist. The New York statutes upon the subject have been adopted in substance by many other States of the Union. These statutes provide, substantially, that a person who knowing the contents thereof, and with intent, by means thereof, to extort or gain any money or other property, or to do, abet, or procure any illegal or wrongful act, sends, delivers, or in any manner causes to be forwarded or received, or makes and parts with for the purpose that there may be sent or delivered, any letter or writing, threatening to accuse any person of a crime, or to do any injury to any person or to any property, or to publish or connive at publishing any libel, or to expose or impute to any person any deformity or dis-

BLACKMAR—BLACKSNAKE

grace is punishable by imprisonment for a term, usually, not exceeding five years. In New York and in various other States it is also a misdemeanor for any person who, under circumstances not amounting to robbery, or an attempt at robbery, with intent to extort or gain any money or other property, verbally makes such a threat as would be criminal under the statute mentioned above, and it is immaterial whether a threat made as specified in the statute, is of things to be done or omitted by the offender, or by any other person.

Blackmar, Frank Wilson, economist: b. Springfield, Pa., 3 Nov. 1854. He graduated at the University of the Pacific 1881, and took his Ph.D. degree at Johns Hopkins 1889. Since 1889 he has been professor of sociology and economics in the University of Kansas. He has been a frequent contributor of articles and reviews to the journals devoted to history and economics. Publications: 'Federal and State Aid to Higher Education in the United States' (1890); 'Spanish Colonization in the Southwest' (1890); 'Spanish Institutions in the Southwest' (1891); 'The Story of Human Progress' (1896); 'History of Higher Education in Kansas' (1900); 'Charles Robinson: The Free State Governor of Kansas' (1900).

Blackmore, Sir Richard, English physician and poet: b. probably about 1650; d. 1729. In 1668 he entered the University of Oxford, and in 1674 took the degree of B.A. Having traveled abroad he took the degree of M.D. at Padua, and was admitted Fellow of the Royal College of Physicians in 1687. In 1697 he had risen to so much eminence as a physician as to be appointed physician to King William, who knighted him. In the preceding year he had made himself known as a poet by the publication of his heroic poem of 'Prince Arthur,' which was soon followed by 'King Arthur.' In 1700 he published a poem entitled a 'Satire on Wit,' in which he assailed his literary contemporaries on the score of irreligion and grossness. The worthy man became the common butt of his day, being attacked by Dryden, Pope, and Swift, not to mention others. The work which produced him the greatest reputation was 'The Creation,' a poem in seven books, which went through several editions, and was greatly applauded, but is, generally speaking, very tamely elaborate.

Blackmore, Richard Doddridge, novelist: b. Longworth, Berkshire, 9 June 1825; d. 20 Jan. 1900. He was educated at Tiverton School and Exeter College, Oxford, where he graduated in 1847. In 1852 he was called to the bar at the Middle Temple, and afterward practised as a conveyancer. His greatest literary success was 'Lorna Doone, a Romance of Exmoor' (1869), one of the best of modern romances. Other novels by him are: 'Clara Vaughan'; 'Cradock Nowell, a Tale of the New Forest'; 'The Maid of Sker'; 'Alice Lorraine, a Tale of the South Downs'; 'Cripps the Carrier'; 'Erema'; 'Mary Anerley'; 'Christowell'; 'Sir Thomas Upmore'; 'Springhaven'; 'Perlycross'; 'Darial'; etc. He has also published a translation of Virgil's 'Georgics' (1862 and 1871). Among his volumes of original poetry are 'Poems by Melanter' (1854); 'The Bugle of the Black Sea' (1855); and 'The Fate of

Franklin' (1860). Mr. Blackmore's work is characterized by vivid and accurate descriptions of nature and of rural life. His male characters are well drawn, and, though not the products of subtle analysis, they are boldly marked and consistent; with his women, however, he is less successful. He is at his best in historical novels, such as 'Lorna Doone,' his greatest work, and 'Alice Lorraine.'

Blackpool, England, a town on the coast of Lancashire, between the estuaries of the Ribble and Wyre, 27 miles south-southwest of Lancaster, which has of late years attracted many visitors by its advantages as a watering-place. It affords excellent accommodation for visitors in the numerous hotels, hydropathic establishments, and lodging-houses, and consists of ranges of lofty houses about three miles long facing the sea, in front of which an excellent promenade and carriage drive extends along the whole distance. The town is abundantly supplied with the means of amusement and recreation, including theatres, concert rooms, fine winter gardens, aquarium, extensive pleasure-grounds, park of 60 acres, a great steel tower (Eiffel Tower), over 500 feet high, a gigantic wheel, and other common summer-resort attractions. There are also a court-house and three markets, several churches, and chapels of various denominations, libraries and news-rooms and free library. Blackpool was incorporated as a municipal borough in 1876. Pop. (1903) 48,000.

Blacksnake, or **Blue Racer**, a common colubrine serpent (*Zamenis constrictor*) found throughout the United States, and the adjacent parts of Canada. The typical eastern blacksnake is uniform lustrous black above, and slate-color beneath, the lower jaw, chin, and sometimes upper edges of the lip-plates white, the tongue black. Western specimens are bright olive-green, with the entire under surface greenish-white, varying to bright yellow, which accounts for the name, "blue" or "green racer," often heard in the Mississippi valley. The young, under 18 inches in length, are variegated with dark blotches upon olive, and light margins to the scales, especially on the sides. The female is larger than the male, but rarely if ever exceeds six feet in length. This is one of the most numerous and vigorous of American snakes, making its home in hollow stumps and underground dens. At the approach of winter, many are likely to gather together in similar retreats, and remain there in a torpid condition until spring, entangled into a ball, for the sake of mutual warmth. Its motions are of the swiftest, it being capable of running with great rapidity and of scaling trees, sometimes to a height of 100 feet above the ground, where it searches from branch to branch for birds' eggs, young squirrels, etc. It will even leap from tree to tree, often a distance of more than its own length; and it is also fond of water, where it swims proficiently. It seeks much of its food in swamps and along streams, mainly frogs, toads, eggs and young of birds, insects, and other snakes. Cope says: "The constricting power of blacksnakes is not sufficient to cause inconvenience to a man, but might seriously oppress a child. . . . It is easy to unwind the snake with the free hand and arm." The blacksnake is harmless, and its bite is no worse than

BLACKSTOCK HILL—BLACKSTONE RIVER

that of a mouse. It is readily tamed, and shows some intelligence. It is courageous and will sometimes attack an enemy, moving forward with the head raised a foot or two above the ground, and waving about with a most terrifying aspect. Its principal enemies are the badger and skunk, and it seems to hold a special animosity toward the copperhead and rattlesnakes, whose trail it follows, at night, by its power of scent; and having overtaken the object of its pursuit, it leaps upon it, avoiding its stroke by its swiftness, wraps itself about it, and slowly crushes its victim to death, after which it swallows it whole. The blacksnake breeds during the summer, the female laying 15 or 20 eggs at a time in the hollow of a sunny bank, or in the midst of a decayed stump, around which she stays, guarding her young until they reach a considerable age.

Several other species of the genus belong to the southwestern United States, Mexico, and the West Indies, and the Texan whipsnake (q.v.) is a near relative. The "chainsnake" is sometimes called "mountain blacksnake." Other blackish serpents known as blacksnakes include a colubrine of Jamaica (*Ocyophis ater*); the death adder (q.v.) of Australia and Tasmania, and some others notable for dark hues. One of the most widespread of the native names of the East Indian Cobra de Capello has the meaning "blacksnake." Consult: Cope, 'Snakes of North America.'

Blackstock Hill, South Carolina, a locality where, on 20 Nov. 1780, the patriots of the State, under Gen. Sumter defeated Tarleton's cavalry after a sharp encounter.

Blackstone, William, the first inhabitant of Boston, was an Episcopal minister, who settled there as early as 1625 or 1626, and died 26 May 1675, on Blackstone River, a few miles north of Providence. On the arrival of Gov. Winthrop at Charlestown, in the summer of 1630, it is stated in the records of that place that "Mr. Blackstone, dwelling on the other side of Charles River, alone, at a place by the Indians called Shawmut, where he only had a cottage, at or not far off from the place, called Blackstone's Point, he came and acquainted the governor of an excellent spring there, withal inviting him and soliciting him thither; whereupon, after the death of Mr. Johnson and divers others, the governor, with Mr. Wilson, and the greatest part of the Church, removed thither." At a court held in April 1633, 50 acres of land near his house in Boston were granted to him forever. In 1634 he sold his land and became the first white settler within the present limits of Rhode Island.

Blackstone, Sir William, English lawyer, and the most popular writer on the laws and constitution of his country: b. London, 10 July 1723; d. 14 Feb. 1780. He was educated on the foundation of the Charter House, whence in 1738 he was removed to Pembroke College, Oxford. He was much distinguished, both at school and at the university, and at an early age compiled a work for his own use, entitled the 'Elements of Architecture,' which has been much praised. Having chosen the profession of the law, he was in due time entered at the Middle Temple, and on this occasion published the admired verses called the 'Lawyer's Farewell to His Muse,' which appeared in 'Dodsley's Mis-

cellany.' In 1743 he was elected Fellow of All-Souls College, Oxford, and in 1746 was called to the bar, and commenced the practice of law. Being deficient in elocution, and not possessed of the popular talents of an advocate, his progress was slow. Having attended the courts of law at Westminster for seven years, without success, he determined to quit the practice of his profession, and retire to his fellowship at Oxford. The system of education in the English universities supplying no provision for teaching the laws and constitution of the country, Blackstone undertook to remedy this defect by a course of lectures on that important subject; and the manner in which he executed the task has conferred a lasting distinction on Oxford. His first course was delivered in 1753, and was repeated for a series of years with increasing effect and reputation. These lectures doubtless suggested to Mr. Viner the idea of founding, by his will, a liberal establishment in the University of Oxford for the study of the common law; and Blackstone was, with great propriety, chosen the first Vinerian professor. His engagements at Oxford did not prevent his occasional practice as a provincial barrister; and in 1754, being engaged as counsel in a contested election for the county of Oxford, he was led into considerations on the elective franchise, which produced his work entitled 'Considerations on Copyholds.' In 1759 he published a new edition of the Great Charter and Charter of the Forest, with an historical preface; and during the same year, the reputation which he had obtained by his lectures induced him to resume his attendance at Westminster Hall, when business and the honors of his profession soon crowded in upon him. In 1761 he was elected member of Parliament for Hindon, made king's counsel and solicitor-general to the queen. About this time he also married, and thereby losing his fellowship, was appointed principal of New Inn Hall; which office, with the Vinerian professorship, he resigned the next year. In 1765 he also published the first volume of his 'Commentaries on the Laws of England'; a work of greater merit than any which had yet appeared on the subject. The real merit and talents of Blackstone, backed by political tendencies which are generally favorable to advancement, now made him an object of ministerial favor, and he was offered the post of solicitor-general in 1770, and, declining it, was made one of the justices of common pleas, which station he held until his death, in his 57th year.

Blackstone, Mass., town in Worcester Co., on the Blackstone River, and on the New York, New Haven and Hartford R.R. It is an important manufacturing town and the centre of an extensive agricultural region. It has numerous churches, schools, library, weekly newspapers, electric lights, and excellent water power. Pop. (1890) 6,138; (1900) 5,721.

Blackstone River, a river of eastern New England; rises in Paxton and Holden townships, Worcester County, Mass., flows southeast into the State of Rhode Island, and empties into the Providence River, near Providence, where it is known as the Seekonk. It is over 50 miles long, and falls over 700 feet, thus affording abundant water-power, and for a great part of its course flows through an almost continuous village of manufacturing establishments.

Blacktail, the name of two different species of western American deer, notable for the blackness of the tail as compared with the snowy white tail of the eastern or "white-tailed" deer. One of them is more suitably called "mule" deer, and is described elsewhere under that title. The other is the Columbian or Pacific Coast deer (*Cervus*, or *Odocoileus columbianus*).

The Columbian blacktail is somewhat smaller than the mule deer, with relatively shorter ears and finer hair. The general color in summer is red or reddish-yellow; in winter the color is more varied. The coat is then brownish-gray, darkest along the spine; top of head, chestnut and black; face gray, with a black spot on the forehead, passing backward as a stripe over each eye; chin white, behind which is a black patch; upper throat, posterior portion of under part, and base of tail, white; chest, sooty; legs, dark cinnamon, white inside, and rest of under parts covered with black; upper surface of the tail, black. The antlers of the buck resemble those of the mule deer. This deer is limited to the Pacific coast, from central California northward to Alaska, and does not pass east of the coast ranges of mountains. It is a deer of the woods, frequenting the foot-hills and valleys especially those covered with small brush; and its habits and gait, more nearly resemble those of the white-tailed deer, than of the mountain-loving mule deer. Its hunting affords excellent sport, and its venison is highly prized. See also DEER. Consult: Farell, 'Big Game in North America', and VanDyke, 'The Deer Family.'

Blackthorn, a shrub or small tree. See SLOE.

Blackwater Fever, an obscure disease of uncertain causation that is prevalent in Africa, and is said to be present in other parts of the world. By many it is regarded as a very severe form of malaria, a malignant form, associated with great prostration and with bloody urine. By others it is considered a disease of itself and due to a special parasite of the blood. The question will undoubtedly be settled within a short time as soon as skilled physicians have the opportunity of studying the disease in Africa.

Blackwell, Mrs. Antoinet Louisa (BROWN), American woman suffragist and Unitarian minister: b. Henrietta, N. Y., 20 May 1825. A graduate of Oberlin (1847), she "preached on her own orders," at first in Congregational churches, becoming at length a champion of women's rights. She married Samuel C., a brother of Dr. Elizabeth Blackwell (1856). She has written 'Shadows of Our Social System' (1855); 'The Island Neighbors' (1871), a novel of American life; 'Sexes Throughout Nature' (1875), etc.

Blackwell, Elizabeth, the first woman who ever received the degree of M.D. in the United States: b. Bristol, England, 3 Feb. 1821. Elizabeth, a girl of 17 years at the time of her father's death, and one of the elder of nine children, opened a school, which she conducted successfully for several years. But her energetic temperament and strong desire for the acquisition of knowledge demanded a wider field; and long reflection having persuaded her that some avenue should be opened to women whom either necessity or choice impelled to gain a subsistence by their own exertions, she felt that

her path of duty lay in that direction. She resolved to become a physician, and to return again to teaching to acquire the requisite means of education. A situation as governess was found in the family of Dr. John Dixon, of Asheville, N. C., where she remained a year, having access, during that time, to a medical library, and receiving from Dr. Dixon some direction as to her reading, but no encouragement in her purpose. At the end of the year she removed to Charleston, S. C., still acting as a teacher of music, but pursuing her studies with the aid and sympathy of Dr. S. H. Dixon, subsequently professor of the institute and practice of medicine in the University of New York. Miss Blackwell next went to Philadelphia, and passed six months in study under Dr. Allen and Dr. Warrington, of that city. During that time she made formal application to the medical schools of Philadelphia, New York, and Boston, for admission as a student. In each instance the request was courteously but firmly denied, on the ground of a want of precedent for such an admission, and of the impropriety of such an innovation upon established custom. Several of the professors, however, avowed a sincere interest in her hopes and purposes, and some of them urged her to seek admission into one or another of the schools under the disguise of a feigned name and male attire. She declined to take into consideration any such suggestion, for, though anxious to obtain a medical education for herself, she was hardly less desirous of asserting her right to it as a woman. Undismayed by these difficulties, however, she next made application to 10 other medical schools in different parts of the country, which was rejected by all except those at Geneva, N. Y., and at Castleton, Vt. At Geneva, the faculty, after expressing their own acquiescence, laid the proposition before their students, leaving the decision with them. The young men unanimously assented to the reception of the new pupil, and pledged themselves that no conduct of theirs should ever cause her to regret the step she had taken. It is to their credit that they faithfully observed this pledge during the two subsequent collegiate years that she passed among them. Here Miss Blackwell took her degree of M.D., in regular course, in January 1849. During her connection with the college, but when not in attendance there upon lectures, she pursued a course of clinical study in Blockley Hospital, in Philadelphia. The spring after her graduation she went to Paris and remained six months as a student in the Maternité, devoting herself to the study and practice of midwifery. The next autumn she was admitted, as a physician, to walk the hospital of St. Bartholomew, in London, where she could not have been received as a student. After nearly a year spent in St. Bartholomew's she returned to New York, where she practised her profession with credit and success, and established the New York Infirmary for Women and Children, and the Woman's Medical College. In 1859 she registered as a physician in England, and since 1869 has practised in London and Hastings; she founded the National Health Society in London, and assisted in founding the London School of Medicine for Women. Her works include: 'Physical Education of Girls'; 'Religion of Health'; 'Counsel to Parents on Moral Education'; 'Pioneer in Opening

the Medical Profession to Women'; 'The Human Element in Sex'; 'Decay of Municipal Representative Institutions.'

Blackwell, Lucy Stone. See STONE, LUCY B.

Blackwell, Thomas, Scottish writer: b. Aberdeen, 4 Aug. 1701; d. Edinburgh, 1757. After receiving the rudiments of his education at the grammar-school of his native city, he entered Marischal College, where he took the degree of A.M. in 1718. A separate professorship of Greek had not existed in this seminary previous to 1700. Blackwell, having turned his attention to Greek, was honored in 1723, when only 22 years of age, with a Crown appointment to this chair. His 'Inquiry into the Life and Writings of Homer' was published at London in 1737. A second edition of the work appeared in 1746, and shortly after 'Proofs of the Inquiry into Homer's Life and Writings.' In 1748 he published anonymously 'Letters Concerning Mythology.' In the course of the same year he was advanced to be principal of his college. In 1750 he opened a class for the instruction of the students in ancient history, geography, and chronology. In 1752 he obtained the degree of LL.D., and in the subsequent year published, in quarto, the first volume of 'Memoirs of the Court of Augustus.' A second volume appeared in 1755, and a third, which was posthumous, and left unfinished by the author, was prepared for the press by John Mills, Esq., and published in 1764.

Blackwell's Island, N. Y., an island in the East River belonging to New York city. It has an area of about 120 acres, and contains the penitentiary, almshouse, lunatic asylum for females, workhouse, blind asylum, hospital for incurables, and a convalescent hospital. Nearly all of these buildings were erected from granite quarried on the island, by convict labor, the style of architecture being of a turreted and battlemented design of the feudal character. The island is bordered by a heavy granite sea wall, also built by the convicts, and a large amount of farming and gardening is carried on by inmates of the penitentiary.

Blackwood, Adam, Scottish writer: b. Dunfermline, 1539; d. 1613. Scotland, during his youth, was undergoing the agonies of the Reformation. He therefore found it no proper sphere for his education, and went to Paris, where, by the liberality of his youthful sovereign, Queen Mary, then residing at the Court of France, he was enabled to complete his studies, and to go through a course of civil law at the University of Toulouse. Having now acquired some reputation for learning and talent, he was patronized by James Beaton, the expatriated Archbishop of Glasgow, who recommended him very warmly to Queen Mary and her husband the dauphin, by whose influence he was chosen a member of the Parliament of Poitiers, and afterward appointed to be professor of civil law at that court. His first work was one entitled 'De Vinculo Religionis et Imperii, Libri Duo' (Paris 1575), to which a third book was added in 1612. His next work was entitled 'Apologia pro Regibus,' and professed to be an answer to George Buchanan's work, 'De Jure Regni apud Scotos.' He next published, in French, an account of the death of his benefactress, Queen Mary, under the title, 'Martyre de Maria Stuart Reyne d'Escosse' (Antwerp, 8vo. 1588).

At the end of the volume is a collection of poems in Latin, French, and Italian, upon Mary and Elizabeth; in which the former princess is praised for every excellence, while her murderess is characterized by every epithet expressive of indignation and hate. In 1644, 30 years after his death, appeared his 'Opera Omnia,' in one volume, edited by the learned Naudæus, who prefixes an elaborate eulogium upon the author.

Blackwood, William, Scottish bookseller, known as the projector and publisher of 'Blackwood's Magazine': b. Edinburgh, 20 Nov. 1776; d. 16 Sept. 1834. He settled in his native city as a bookseller in 1804, and soon added the trade of a publisher to his original business. The first number of 'Blackwood's Magazine' appeared on 1 April 1817, and from the first was conducted in the Tory interest. It was started just at the time when the general peace which had been established in Europe was beginning to reanimate the hopes of the Whigs, and when it was all the more necessary for the Tories to defend by the press that preponderance which they still held in Parliament. Mr. Blackwood was fortunate enough to secure as his coadjutors in his new literary undertaking most of the leading authors of the day belonging to the Tory party, among them Sir Walter Scott, John Gibson Lockhart, Hogg (the Ettrick Shepherd), Prof. Wilson (Christopher North), De Quincey (the English Opium-eater), and others. All that was connected with the management of the magazine he took into his own hands, and he himself selected the articles for each number—a task for which he was admirably qualified, for although he wrote little himself, he was an admirable judge of literary works. The new magazine on its first appearance entered upon a campaign against the Edinburgh 'Review,' combating both its political views and its literary decisions. From the first it attracted a great deal of attention, and its success was decided by the appearance of the 'Noctes Ambrosianæ,' a series of articles in the form of dialogues, in which the current questions in politics and literature were discussed with the most pungent sarcasm and inexhaustible humor. The brilliant articles of Dr. Maginn added not a little to its reputation, and constantly, as the original contributors withdrew, new and valuable accessions were made to the staff of its supporters. After his death his business continued to be carried on by his sons, and the magazine, although it has perhaps lost some of its former reputation (or notoriety), still keeps its place as one of the leading periodicals.

Blackwood. See DALBERGIA.

Blackwood's Magazine. See BLACKWOOD, WILLIAM.

Bladder, the muscular organ that in man and the lower animals holds the urine. The kidneys secrete urine constantly, the bladder stores it and only empties itself at more or less definite intervals. In man the bladder is a flattened rounded to conical organ about the size of an orange, and holding under normal conditions about 16 ounces of urine (one pint). It is situated in the lower portion of the abdominal cavity just behind the pubic bone, which serves as a protection. Its general shape is rounded triangular, the flat side being above, the ureters leading from the kidneys entering at the corners; the pointed end corresponding to the

BLADDER-NUT—BLADDERWORM

opening into the urethra, through which canal the urine is voided. The walls of the bladder are made up of several layers; the outer wall is of peritoneum in part, or serous and connective tissue combined. The greater part of the wall is made up of involuntary muscle fibre, arranged longitudinally and circularly; the innermost coat is thin and delicate,—the mucous membrane,—and is lined throughout by layers of regularly flattened squamous epithelial cells. The nervous supply of the bladder, by means of which it is emptied, is complex and probably threefold. It is under the influence of the sympathetic nervous system of the hypogastric plexus; there are subsidiary centres in the spinal cord and higher up in the human cortex certain voluntary efforts have their influence on the bladder control. The primary centres of control are in the sympathetic. These cause the bladder in the young infant and also in the patient whose spinal cord and centres are diseased to be emptied and in the so-called irritable bladder it is probable that this part of the mechanism is mostly affected.

There is a very marked relation between the skin activities and the kidney and bladder action, for while the skin is acting freely as in exercise in warm weather, a large amount of water is thus given off, which in cold weather is eliminated through the kidneys and thus by the bladder. This is noted daily when in cold weather one leaves the warm house and shortly after walking in the cold of the outside air, the desire to urinate becomes urgent. Irritability of the bladder, particularly in children, and bedwetting is often a very troublesome complaint. It may be due to a variety of causes, excessive irritation, however, would probably not result in bedwetting, particularly in older children, if the control (inhibition) normally maintained by the brain were not cut off by deep slumber. The treatment is always medical and is often very difficult. Infection of the bladder frequently occurs and leads to many serious complications. (See CYSTITIS.) Stones also develop in the bladder. (See CALCULUS.)

Paralysis of the bladder *per se* is a rare affection; paralysis of the sphincter that controls the outlet may result from a variety of causes. It usually results in incontinence of urine. Retention is an opposite condition and is frequently due to loss of sympathetic nerve action, such as follow labor, or an operation, or from the anæsthesia of opium, belladonna, or similar narcotics. It may also be due to mechanical obstruction, in old men, particularly being due to an hypertrophied prostate gland.

Bladder-nut (*Staphylea*), the type genus of the order *Sapindaceæ*, consisting of eight species of ornamental shrubs or small trees, natives of the northern hemisphere. The common bladder-nut (*S. pinnata*) a native of Europe and Asia, which attains a height of 15 feet, and is often planted for ornament, bears panicles of whitish flowers in late spring. The American bladder-nut (*S. trifolia*), which ranges from Quebec to Minnesota and southward to South Carolina and Missouri, bears nodding panicles or umbel-like racemes of white flowers and, like several of the other species, is used in shrubberies. The wood of the two species mentioned is white and hard and is used in turning. The flower buds are pickled like capers and the seeds sometimes eaten. The common name is suggested by the inflated capsule and the hard shell

of the seed; the generic name by the resemblance of the raceme to a bunch of grapes, the staphyle of the Greek language.

Bladderworm, *Cysticercus* or immature stage of the tapeworm, the hydatid of physicians. By far the most injurious species is *Tania echinococcus*, more frequently causing death than any other entozoon. In its adult or strobila state this worm only infests the dog and wolf, but its larva, the hydatid of physicians, frequently occurs in the human body. It is very small, seldom exceeding six millimetres in length, there being but four segments, including the head, which has a pointed rostellum, with a double crown of large-rooted hooks; there are four suckers present, and the last segment, when sexually mature, is as long as the anterior ones taken together. The hydatid (*Proscotex*) forms large proliferous vesicles, in which the scolices (echinococcus heads) are developed by budding internally. About 5,000 eggs are developed in a single segment (*Proglottis*). The six-hooked embryos develop, are expelled from the dog, and find their way in drinking water or in food into the human intestines, whence they bore into the liver, their favorite habitat, or are carried along the blood vessels into some other organ, where they develop into bladder-like bodies, called hydatids. In its earliest stages the hydatid is spherical and surrounded by a capsule of condensed connective tissue of its host. By the fourth week the young *F. echinococcus* is one-fiftieth of an inch long, and it is probably many months before the echinococci heads are entirely developed. When this stage is reached the tapeworms become sexually mature in from seven to nine weeks after, when the milk-white worms may usually be found imbedded in the mucus of the duodenum and upper part of the small intestines, with their heads attached to the villous surface of the intestine. The hydatids or cysts in which the echinococci develop are of three kinds,—exogenous, endogenous, and multilocular,—and lie imbedded in the parenchyma of the liver, etc., and are filled with a clear amber-colored fluid. The echinococcus heads, first on the inner surface of the cyst and in the interior of the echinococcus head (brood-capsule), develops a second brood of scolices, contained in a secondary cyst. Finally, a tertiary cyst, containing tertiary or granddaughter scolices, arises. In such cases the number of tapeworms which arise from one embryo is naturally enormous, and the parent vesicle may reach a very considerable size, being sometimes as large as a man's head. In consequence of this enormous growth the vesicles frequently obtain an irregular shape; while on the other hand the tapeworms which develop from them remain very small, and carry, as a rule, only one ripe proglottis. Sometimes the secondary hydatids will develop scolices and granddaughter vesicles before the original maternal hydatid has acquired echinococcus heads.

So long as the tapeworm head (*scolex*) remains attached to the body of the bladder-worm and in the host of the latter, it never develops into a sexually mature tapeworm; although in many cases it grows to a considerable length (*Cysticercus fasciolaris* of the house-mouse). The bladderworm must enter the alimentary canal of another animal before the head can, after separation from the body of the bladderworm, develop into the sexually mature tapeworm. This

transportation is effected passively, the new host eating the flesh or organs of the animal infected with *Cysticerci*. The tapeworms, therefore, are principally found in the *Carnivora*, the *Insectivora*, and the *Omnivora*, which receive the bladderworms in the flesh of the animals on which they feed. The vesicles are digested in the stomach, and the cestode head becomes free as a scolex. The latter is, perhaps, protected from the too intense action of the gastric juice by its calcareous concretions, and at once enters the small intestine, fastens itself to the intestinal wall, and grows by gradual segmentation into a tapeworm. From the scolex the chain of proglottides proceeds as the result of a growth in length accompanied by segmentation, a process which is to be looked upon as a form of asexual reproduction (budding in the direction of the long axis). The development of the scolex is then to be explained as a metamorphosis, characterized by the individualization of certain stages of the development. But the whole life-history is a case of metagenesis, inasmuch as the sexual proglottides alternate with the asexual scolex. See TAPEWORM.

Bladderwort, *Utricularia*, a genus of about 150 species of largely aquatic herbs of the natural order *Lentibulariaceæ*, widely distributed throughout the world, but especially abundant in the tropics. The aquatic species are remarkable for the little, sometimes valved, bladders which entrap and digest aquatic insects and other water animals. The bladders which are at first filled with water become inflated with air at flowering time so that the flower instead of being submerged like the rest of the plant, is raised above the surface until after blossoming, when water again fills the bladders, the plants sinking to the bottom, where the seeds are ripened. These aquatic species, of which about a dozen with yellow or blue flowers are natives of the United States, are common in ditches, ponds, and marshes throughout the world. They are sometimes cultivated in aquaria more as curiosities than for any intrinsic beauty. In the marsh species the bladders are less effective and numerous than in the pond species, and in the terrestrial kinds they are small, abortive, and useless. These last have leaves of ordinary forms and are often tuberous, whereas members of the first group have much dissected foliage like other pond plants and are rootless. Some of the tropical species are showy epiphytes and are cultivated in hot-houses like orchids, with some of which they compare in beauty. Consult: Bailey, 'Cyclopaedia of American Horticulture' (1900-2).

Bladensburg, Maryland, a small town in Prince George County, on the east branch of the Potomac, about six miles east from Washington, with a population in 1900 of 463. At the bridge over the Potomac west of Bladensburg, the battle with the English which preceded the capture of Washington, took place toward the latter part of the War of 1812, Gen. Ross and Admiral Cockburn with about 5,000 men, appeared in Chesapeake Bay to attack Washington. The American forces fell back to Bladensburg and awaited the British. The Americans numbered about 7,000, but were scattered and untrained. On 24 Aug. 1814, the British advanced to the attack. The American artillery held them in check for a time, but the troops pushed forward.

The Americans fled in wild disorder; the confusion spread and soon Gen. Winder, the American commander, gave orders for a general retreat. The American loss was 76 men; the British more than 500 killed and wounded. Bladensburg is famous in American history as the site of the duelling ground, where many famous duels growing out of quarrels in Washington were fought, as that in which Barron killed Decatur in 1820.

Blagoveshtchensk, blä - gö - vyěsh'chěnsk, Russia, a town of eastern Siberia, capital of the province of the Amoor, and of the general government of the Amoor, on the river Amoor, where it receives the Zeya, near the Chinese town of Aigoon. Founded as a military post in 1856 it is now an important place, with secondary schools, theological seminary, etc. Pop. (1903) 37,841.

Blaikie, William, American athlete and writer on physical training: b. York, N. Y., 1843; d. there 6 Dec. 1904. He became a lawyer in New York. He has written 'How to Get Strong' (2d ed. 1880); 'Sound Bodies for our Boys and Girls' (1883).

Blaikie, William Garden, Scotch clergyman: b. Aberdeen, 1837; d. 11 June 1899. He was graduated at the University of Aberdeen; ordained a minister of the Established Church in 1842; joined the Free Church in 1843; and was appointed professor of apologetics and pastoral theology in New College, Edinburgh, 1868. He was a delegate to the Presbyterian General Assembly of the United States in 1870; took a leading part in the formation of the Alliance of the Reformed Churches; and was editor of the 'Free Church Magazine' in 1849-53; the 'North British Review' in 1860-3; the 'Sunday Magazine' in 1871-4; and the 'Catholic Presbyterian' in 1879-83. His writings include 'Bible History in Connection with General History' (1859); 'Bible Geography' (1860); 'Glimpses of the Inner Life of David Livingstone' (1880); 'Public Ministry and Pastoral Methods of Our Lord' (1883); 'Leaders in Modern Philanthropy' (1884), etc.

Blaine, Ephraim, American soldier: d. Carlisle, Pa., 1808. He entered the army as a colonel, at the commencement of the Revolutionary War, and was subsequently made commissary-general. His services were gallant and patriotic. He was with Washington in many of the most trying scenes of the Revolution, and enjoyed the confidence of his chief to the fullest extent. During the "dark winter" at Valley Forge, the preservation of the American army from starvation was in a great degree owing to the exertions and sacrifices of Col. Blaine.

Blaine, James Gillespie, American statesman: b. West Brownsville, Pa., south of Pittsburgh, 31 Jan. 1830; d. 27 Jan. 1893. His father, a cultivated landowner, was a Presbyterian of Scotch-Irish blood; his mother was a Catholic. He was a precocious boy with a strong taste for history and literature, and the star of his debating club as orator and parliamentarian. At 13 he entered Washington College in his native county, graduated at 17, and after teaching and studying law, removed to Augusta, Me., in 1854. He entered journalism and politics, joined the new Republican party the next year, was a delegate to its first (Fremont) convention in 1856, and in 1858 became chairman of the State

Republican committee—an extraordinary position at 28 after but four years' residence. He remained such for 20 years, the almost omnipotent dictator of the party's State action. In 1858, also, he was elected to the legislature, and re-elected three more terms, being speaker the last two; and in 1862 was sent to Congress, and re-elected six additional terms to the House. In the House he was the most effective and dexterous of debaters, an adept at parliamentary law, of instant readiness and endless resource; and outside he became early the most captivating, magnetic, and brilliant of party leaders. With a prodigious and instant memory both for facts and faces, saturated with political history and the records of all prominent public men, with great charm of utterance and exuberant geniality of manner, he excited in the mass of his party the most enthusiastic devotion; but unfortunately in the "independent" wing an equally invincible distrust, which ultimately defeated his most cherished ambition. As congressman, his most noted positions were opposing Thaddeus Stevens' reconstruction plans for putting the South under military government, and of cutting down the representation of the States when readmitted to a basis of legal voters; opposing the payment of the public debt in greenbacks; and supporting the agitation which led to Great Britain's admitting her citizens' right to change their allegiance (1870). From 1869 to 1874 he was speaker, and gained the highest reputation for parliamentary ability, firmness, impartiality, and dispatch of business. The tremendous reaction of 1874 against Grant's second term swept the Democrats into control of the House by an immense majority, and Mr. Blaine became the leader of the Republican minority. An envenomed struggle at once began. As a matter of party tactics, and to pave the way for the election of 1876, Mr. Blaine sought to inflame Republican feeling by dwelling on the harshest memories of the war; the Democrats retorted by a series of attacks on his personal integrity in the speakership, as evidence of which they cited letters to a Boston broker which had been kept by a clerk named Mulligan. (See MULLIGAN LETTERS.) He exhibited and read the letters on the floor of the House to prove that they contained nothing discreditable; but the charges, in the hands of his enemies, remained one of the influences which twice lost him the nomination and at last the election to the presidency. In 1876 he received 285 votes, much the largest single vote, on the first ballot at the Republican convention, and 351 on the seventh; his imminent success then produced a coalition on Gen. Hayes. Senator Morrill of Maine becoming secretary of the treasury, Mr. Blaine was chosen senator for the unexpired term, and the following winter for the full term. He opposed the electoral commission on the ground that Congress was conferring powers beyond its own; opposed Hayes' withdrawal of the troops that upheld the carpet-bag governments; opposed the Bland Silver Bill and the adoption of the gold standard alike, believing bimetalism feasible and preferable; advocated ship subsidies, and rigid prohibition of Chinese immigration. In 1880 the attempt at a third term for Grant was defeated by the Blaine forces, who gave him 284 on first ballot; but after six days and 35 ballots, seeing that Blaine could not be nominated, united with the Sherman party to nominate Garfield,

by 399 to Grant's 306. Garfield made him secretary of state, and in his short tenure he planned a Pan-American Congress, attempted mediation between victorious Chile and crushed Peru, and attempted to cancel the Clayton-Bulwer Treaty (q.v.). But the speedy assassination of Garfield, and the accession of Arthur, the lieutenant of Blaine's mortal enemy, Roscoe Conkling, made his place untenable, and on 19 December he resigned. He at once began his two-volume 'Twenty Years in Congress,' a work of great charm and value; issuing the first volume in 1884, in time to do good work conciliating support for the next election. But meantime a memorable political letter to a New York State friend, widely published, was taken as a cue to his adherents in that State to vote against the administration candidate; and caused such a heavy fall in the Republican vote for governor that S. J. Folger, secretary of the treasury, was overwhelmed, and Grover Cleveland, the mayor of Buffalo, in high repute for having crushed a ring of plunderers there, was elected by 192,000 plurality. This unprecedented victory in the largest State of the Union gave Mr. Cleveland the Democratic nomination for President in 1884; and when Mr. Blaine was at last nominated by the Republicans (541 out of 813 on fourth ballot), the Independents carried out the threat of many years by bolting the nomination and mostly voting for Cleveland, who carried New York by 1,047 and with it the electoral majority. After his defeat he issued the second volume of his work (1886), and the next year a volume entitled 'Political Discussions.' Again a candidate in 1888, he withdrew in favor of Harrison, and was made secretary of state once more; he resumed his Pan-American policy, made a futile attempt to induce Great Britain to join in preserving the seals from extermination (see *BERING SEA QUESTION*), and favored a reciprocity commercial policy which made many of his old opponents draw toward him. He resigned in June 1892, in hope of securing the next Republican nomination, but found it out of the question. He died early the following year, of Bright's disease. His life was written by his kinswoman, Gail Hamilton (1895).

Blainville, Henri Marie Ducrotay de, òn-rè mà-rè dü-krô-tà dè, French naturalist: b. Arques, near Dieppe, 1778; d. 1 May 1850. He studied medicine and the allied sciences at Paris, and obtained his degree of M.D. in 1808. He was for a time assistant to Cuvier, whose influence helped to place him in the chair of anatomy and zoology in the Faculty of Sciences at Paris in 1812. Unfortunately misunderstandings soon arose between the master and his comparatively youthful rival, and ultimately terminated in an open rupture. In 1825 Blainville was admitted to the Academy of Sciences as the successor of Lacépède, and on the death of Lamarck in 1829, the chair which he held in the Museum of Natural History having been divided, the department of mollusca, zoophytes, and worms was committed to Blainville, whose important works on these groups made it impossible to confer it on any other. In 1832 he quitted this department to become the not unworthy successor of Cuvier in the chair of comparative anatomy in the same establishment. His works, contained both in the more important collections of the period, and in separate treatises, are too numerous to be enumerated,

but mention is especially due to 'L'Organisation des Animaux, ou Principes d'Anatomie Comparée' (1822); 'Manuel de Malacologie et de Conchyliologie avec Atlas de 100 Planches' (1825); 'Cours de Physiologie Générale' (1829-32); 'Manuel d'Actinologie' (1834); 'Sur les Principes de la Zooecologie' (1847); and above all, the gigantic but unhappily unfinished work entitled 'Ostéographie ou Description Iconographique Comparée du Squelette et du Système Dentaire des Cinq Classes d'Animaux Vertébrés, Récents et Fossiles' (1839-50).

Blair, Andrew Alexander, American chemist: b. Kentucky, 20 Sept. 1848. He graduated at the United States Naval Academy, 1866; was chief chemist to the United States Commission to test iron, steel, and other metals, 1875-8, and to the United States Geological Survey and 10th census, 1879-81. Since then he has been engaged in general practice. Besides reports to the government and contributions to scientific journals he has published 'The Chemical Analysis of Iron: Complete Account of all the Best-Known Methods for the Analysis of Iron, Steel, etc.' (Phila. 1888).

Blair, Austin, American lawyer: b. Caroline, N. Y., 8 Feb. 1818; d. Jackson, Mich., 6 Aug. 1894. He graduated at Union College in 1839; studied law in Oswego, N. Y., and removed to Jackson, Mich., where he was admitted to the bar in 1842. He was elected to the legislature in 1846; became conspicuous in the convention which established the Republican party in Michigan; and was elected governor of Michigan in 1860. He was a member of Congress (1866-70).

Blair, Francis Preston, American journalist and politician: b. Abingdon, Va., 12 April 1791; d. Silver Spring, Md., 18 Oct. 1876. In early life he was a Jacksonian Democrat. He edited the *Washington Globe* from 1830 to 1845. Through his anti-slavery sentiments he became one of the founders of the Republican party, but in later years returned to the Democratic faith.

Blair, Francis Preston, Jr., American soldier and statesman (son of the preceding): b. Lexington, Ky., 19 Feb. 1821; d. St. Louis, Mo., 5 July 1875. He was a representative in Congress from Missouri (1857-9 and 1861-3); became a major-general in the Union army in the Civil War, taking an active part in the Vicksburg campaign and Sherman's march to the sea; was an unsuccessful Democratic candidate for Vice-President in 1868, and United States senator (1870-3).

Blair, Henry William, American legislator: b. Campton, N. H., 6 Dec. 1834. He received an academic education; was admitted to the bar in 1859; served through the Civil War, becoming lieutenant-colonel of the 15th New Hampshire Volunteers, and was twice wounded. After serving in both branches of the State legislature he was a member of Congress (1875-9 and 1893-5), and United States Senator (1879-89). He is the author of what was known as the "Blair Common School Bill," designed to distribute a certain amount of Federal money for educational purposes among the various States in proportion to the number of illiterates. He was a strong opponent of Chinese immigration, and, when he was appointed and confirmed United States minister to China,

that government objected to receiving him. He has been an active worker in the cause of temperance and other reforms.

Blair, Hugh, Scottish divine: b. Edinburgh, 7 April 1718; d. 27 Dec. 1800. He commenced his academic career at Edinburgh University in 1730. In 1741 he was licensed as a preacher, and the following year was ordained to the parish of Collessie, Fife, but a few months after he was elected to the second charge of the Canongate, Edinburgh. In 1754 he received one of the city charges, that of Lady Yester's church, and in 1758 one of the charges of the High Church. In 1759 he commenced a course of lectures to students upon the principles of literary composition; and in 1762 he was made professor of rhetoric and belles-lettres in the University of Edinburgh, being the first that ever occupied this chair. He continued the course till 1783, when he published his lectures, which received very high praise. In 1763 he published a dissertation on the 'Poems of Ossian,' in the authenticity of which he firmly believed.

It was not till 1777 that he could be prevailed upon to offer to the world any of those sermons with which he had so long delighted a private congregation. One of the sermons having been sent by Strahan, the king's printer, to Dr. Johnson for his opinion, Strahan received from him the following characteristic note: "I have read over Dr. Blair's first sermon with more than approbation; to say it is good is to say too little." Strahan thereupon agreed to purchase the volume, with Mr. Cadell, for \$500. The sale was so rapid and extensive, and the approbation of the public so high, that the proprietors voluntarily doubled the stipulated price. The volume speedily fell under the attention of George III., and by royal mandate a pension of \$1,000 a year was bestowed on Dr. Blair. During the subsequent part of his life Dr. Blair published three other volumes of sermons; and it might safely be said that each successive publication only tended to deepen the impression produced by the first.

Blair, James, American clergyman and educator: b. Scotland, 1656; d. Williamsburg, Va., 1 Aug. 1743. In 1685 he was sent as a missionary to Virginia by Dr. Compton, Bishop of London. There he secured the confidence of the planters, and proved himself far in advance of his contemporaries on the question of slavery. In 1689 Sir Francis Nicholson appointed him "commissary," the highest ecclesiastical office in the colony. This office gave him a seat in the Council of the colonial government; he presided over the trials of clergymen, and pronounced sentence upon conviction of crimes or misdemeanors. His great desire was to see a college established in the colony. The Assembly and governor warmly sympathized with his project; he went to England and laid his plan before William and Mary, and on 14 Feb. 1692, a charter for the college was granted, the bishop of London being appointed chancellor and Blair president, and the institution named "William and Mary." Its opening was repeatedly delayed, and Blair did not enter on his duties as president until 1720, but his enthusiasm never wavered, and his efforts were finally crowned with success. He left his library to the college. He wrote 'Our Saviour's Divine Sermon on the Mount' (London 1722, 4 vols.; 3d ed. 1740), a

work highly considered throughout the 18th century.

Blair, John, Scotch chronologist and geographer: d. 24 June 1782. He went to London about the middle of the 18th century. In 1754 the publication of a work in folio, entitled 'The Chronology and History of the World from the Creation to 1753 A.D.,' gained him great reputation. He dedicated his work to Lord Chancellor Hardwicke, and in 1757 was appointed chaplain to the Princess Dowager of Wales, and mathematical tutor to the Duke of York, whom he accompanied, in 1763, on a tour to the Continent, having already received several ecclesiastical preferments. On his return to England he published, in 1768, a new edition of his 'Chronological Tables,' with 14 maps of ancient and modern geography annexed.

Blair, John Insley, American philanthropist: b. Belvidere, N. J., 22 Aug. 1802; d. 2 Dec. 1899. In early life he was a merchant and banker; subsequently becoming the individual owner of more miles of railroad property than any other man in the world. He acquired a very large fortune; loaned the Federal government more than \$1,000,000 in the early part of the Civil War; built and endowed at a cost of more than \$600,000 the Presbyterian Academy in Blairstown, N. J.; rebuilt Grinnell College, Iowa; erected Blair Hall and made other gifts to Princeton University; was equally liberal to Lafayette College; and had erected more than 100 churches in different parts of the West, besides laying out many towns and villages on the lines of his numerous railroads.

Blair, Montgomery, American lawyer: b. Franklin County, Ky., 10 May 1813; d. Silver Springs, Md., 27 July 1883. He was graduated at the United States Military Academy in 1835; resigned from the army, 1836; was admitted to the bar, 1839, and began practice in St. Louis. He was judge of the court of common pleas, 1843-9; removed to Maryland in 1852; was United States solicitor in the court of claims, 1855-8. He acted as counsel for the plaintiff in the widely known Dred Scott case. In 1861-4 he was postmaster-general. In 1876-7 he acted with the Democratic party in opposing Hayes' title to the office of President.

Blair, Robert, Scotch clergyman and poet: (eldest son of the Rev. David Blair, one of the ministers of Edinburgh, and chaplain to the king): b. Edinburgh, 1699; d. Athelstaneford, 1746. He was ordained, in 1731, minister of Athelstaneford, in East Lothian, where he spent the remainder of his life. He was a man of learning and of elegant taste and manners. A botanist and florist; he was also skilled in optical and microscopical knowledge, on which subjects he carried on a correspondence with some learned men in England. He was a man of sincere piety and very assiduous in discharging the duties of his clerical functions. His best-known poem, 'The Grave,' was chiefly composed before his ordination. It was first printed in 1743, and is now esteemed as one of the standard classics of English poetical literature, in which rank it will probably remain longer than many works of greater contemporary or even present fame.

Blake, Edward, English statesman: b. Cairngorm, Ont., Canada, 13 Oct. 1833. He was

educated at Upper Canada College and Toronto University; was called to the bar in 1856 and engaged in practice in Toronto. He entered public life in 1867; was premier of Ontario, 1871-2; minister of justice, 1875-7, and the recognized leader of the Canadian Liberal party, 1880-91. He declined the appointments of chancellor of upper Canada in 1869, chief justice of Canada in 1875, and chief justice of Ontario in 1897, and also the honor of knighthood. In 1892 he was invited by the leaders of the Anti-Parnellites in Ireland to enter the British House of Commons as the representative of an Irish constituency. Consenting, he removed to South Longford, was elected for that district, and in 1895 was re-elected. In 1896 he was appointed a member of the judiciary committee of the privy council.

Blake, Eli Whitney, American inventor: b. Westboro, Mass., 27 Jan. 1795; d. New Haven, 17 Aug. 1886. He graduated at Yale University in 1816, and began business with his uncle, Eli Whitney, in the manufacture of firearms. In 1834 he founded, near New Haven, Conn., the pioneer factory for the manufacture of domestic hardware. In 1857 he invented the widely-known stone- and ore-crusher called the Blake crusher, which introduced a new era in road-making and mining industries, and is used throughout the world.

Blake, Francis, American inventor: b. Needham, Mass., 25 Dec. 1850. He served for 13 years on the United States Coast Survey, part of the time engaged in field work and its reduction to determine differences of longitude between the observatories at Greenwich, Paris, Cambridge, and Washington. Having devoted himself to the study of experimental physics, in 1878 he invented the famous Blake transmitter, which is the telephonic transmitter now most widely used throughout the world. He has also patented other electrical devices.

Blake, John Laurie, American clergyman and author: b. Northwood, N. H., 21 Dec. 1788; d. Orange, N. J., 6 July 1867. He was educated at Phillips Exeter Academy and at Brown University. He first entered the Congregational ministry, but in a short time became an Episcopalian and was ordained in that Church. He settled in Pawtucket, and later in Hopkinton, N. H., and in 1822 removed to Boston. He continued to teach in this school till 1830, then devoted himself to literary work. While a teacher he published several text-books, prepared for his own classes, and was editor of the 'Gospel Advocate.' His greatest work, a 'Biographical Dictionary,' was first published in 1835.

Blake, Mrs. Lillie (DEVEREUX) Umstead, American advocate of woman's rights and novelist: b. Raleigh, N. C., 1835. Her first husband, Frank G. Quay Umstead, died in 1859; she married Grenfill Blake in 1866, who died in 1896. She has written and spoken much on woman suffrage, and her novels bear on this theme. She has written 'Southwold' (1859); 'Rockford' (1863); 'Fettered for Life' (new ed. 1885); 'Woman's Place To-Day' (1883), a reply to Dr. Morgan Dix's 'Lenten Lectures on Women,' which attracted attention; etc. In 1900 she was president of the Civic and Equality Union.

Blake, Mary Elizabeth McGrath, American poet and writer: b. Dungarven, Ireland, 1 Sept. 1840. In verse she has written 'Poems' (1882); 'Youth in Twelve Centuries' (1886); etc. Of her travels may be named 'On the Wing' (1883); 'A Summer Holiday.'

Blake, Robert, British admiral: b. Bridgewater, Somerset, August 1599; d. 17 Aug. 1657. After attending the grammar school of his native place he was sent to Wadham college, Oxford, where he took the degree of B.A. in 1617. On his return to Bridgewater he lived quietly on the fortune left him by his father, and was led to embrace the principles of the Puritans, by whose interest he was elected member for Bridgewater in the Parliament of 1640. This being soon dissolved, he lost his election for the next, and immediately sought to advance the cause in a military capacity in the war which then broke out between the king and the Parliament. He soon distinguished himself by his activity. In 1649 he was sent to command the fleet in conjunction with Cols. Deane and Popham, and thus commenced the naval career which has given him so distinguished a place in British history. He immediately sailed to Kinsale in quest of Prince Rupert, whom he attempted to block up in that port. The prince escaped to Lisbon, where Blake followed him; and, being refused permission to attack him in the Tagus by the king of Portugal, he took several rich prizes from the Portuguese (against whom the Parliament declared war), and followed Rupert to Malaga, where, without asking permission of Spain, he attacked him and nearly destroyed the whole of his fleet. On his return to England he was made warden of the Cinque Ports, and soon after reduced the islands of Scilly and Guernsey. In 1652 he was made sole admiral, and on the 19th of May was attacked in the Downs by Van Tromp with a fleet of 45 sail, the force of Blake amounting only to 23. He fought so bravely, however, that Van Tromp was obliged to retreat. He then continued his cruise, took a number of Dutch merchantmen, and after several partial actions drove the enemy into their harbor and returned to the Downs. On 29 May he was again attacked by Van Tromp, whose fleet was now increased to 80 sail. Blake engaged this vast force with a very inferior number and an unfavorable wind; but, after every possible exertion, was obliged to retreat into the Thames, on which Van Tromp was so much elated that he sailed through the Channel with a broom at his masthead, to signify that he had swept the sea of British ships. In the February following, Blake, having with great diligence repaired his fleet, put to sea with 60 sail, and soon after met the Dutch admiral, who had 70 sail and 300 merchantmen under convoy. During three days a furious running fight up the Channel was maintained with obstinate valor on both sides, the result of which was the loss of 11 men-of-war and 30 merchant ships by the Dutch, while that of the English was only one man-of-war. It was in April of this year that Cromwell assumed the sovereignty, on which occasion Blake and his brother admirals issued a declaration that, notwithstanding this change, they resolved to persist in faithfully performing their duty to the nation. "It is not for us," said Blake to his officers, "to mind state affairs, but to keep the foreigners from fooling us." On 3

June he again engaged Van Tromp with dubious success; but, renewing the action the next day, he forced the Dutch to retire with a considerable loss in ships and men. On his return he was received by Cromwell with great respect, and returned member in the new Parliament for Bridgewater. Aware of his affection for a republican government, the protector was not displeased at having occasion to send him, with a strong fleet, to enforce a due respect to the British flag in the Mediterranean. He sailed first to Algiers, which submitted, and then demolished the castles of Goletta and Porto Ferino, at Tunis, because the dey refused to deliver up the British captives. A squadron of his ships also blocked up Cadiz and intercepted a Spanish plate fleet. Being now very sick, he resolved to do one more service to his country before his death, and sailed with 24 ships to Santa Cruz, in Teneriffe, and, notwithstanding the strength of the place, burned the ships of another Spanish plate fleet which had taken shelter there, and by a fortunate change of wind came out without loss. His brother having failed in some part of duty during this service, he immediately removed him from his command. Finding his disorder making rapid progress he then sailed for England, and expired while the fleet was entering Plymouth Sound. His body was honored with a magnificent public funeral, and interred in Westminster Abbey, whence it was, with pitiful spite, removed at the Restoration and buried in St. Margaret's churchyard. So disinterested was he that, after all his rich captures and high posts, he scarcely left behind him \$2,500 of acquired property, freely sharing all with his friends and seamen, into whom he infused that intrepidity and spirit of enterprise by which the British navy has been ever since so highly distinguished.

Blake, William, English poet, painter, and engraver: b. London, 28 Nov. 1757; d. 12 Aug. 1857. At the age of 10 he was sent to a drawing-school, and four years later he was apprenticed for seven years to the engraver James Basire, for whom he drew from the monuments in the older London churches and Westminster Abbey. In 1778 he studied in the Royal Academy, and about this time he began to engrave for the booksellers, among his chief productions being plates after Stothard for the 'Novelists' Magazine.' To the first exhibition of the Royal Academy he sent a drawing entitled 'The Death of Earl Godwin.' He married in 1782, and for the three years 1784-7 carried on a printseller's shop in partnership with another engraver. From his earliest years Blake was a mystic. He believed that all things exist in the human imagination alone, and had a wonderful power of imaginative vision which enabled him to see angels in trees and in fields, great men of past times, etc. His 'Songs of Innocence,' verse and designs (1789), and the companion 'Songs of Experience' (1794), were reproduced by himself and his wife by a process which he believed to have been revealed to him in a dream by a dead brother. Between 1793 and 1800 he produced a large number of designs, among them 537 illustrations for Young's 'Night Thoughts.' In 1800 he became acquainted, through Flaxman, with the poet William Hayley, who gave him artistic commissions, and for three years he lived in his neighborhood at Felp-ham. He next produced the designs to Blair's

'Grave' (engraved by Schiavonetti), which stand in the forefront of his artistic work. In 1808 he sent to the Royal Academy the pictures 'Christ in the Sepulchre Guarded by Angels,' and 'Jacob's Dream,' the last pictures he exhibited there. From 1813 till his death he had a staunch friend and patron in the painter John Linnell. It was about this time that he executed the series of pencil drawings known as 'Spiritual Portraits.' The highly prized woodcuts to Thornton's 'Virgil' were executed in 1820, and in 1825 he produced for Linnell his wonderful 'Inventions to the Book of Job,' which, containing 22 engravings, 21 original designs in colors, with the original colored drawings by the artist (the property of the Earl of Crewe), sold in London, in 1903, for \$28,000. He also executed a series of engravings and designs from the 'Divina Commedia.' At the sale just mentioned 12 drawings in colors for 'L'Allegro' and 'Il Penseroso' brought \$9,800, and the original colored issue of 'America, a Prophecy,' sold for \$1,475. Among Blake's other writings are: 'Poetical Sketches' (1783); 'Gates of Paradise' (1793); 'Prophetic Books,' sadly incoherent, but with splendid designs (1793-1804). The only complete edition of his works is that of E. J. Ellis and W. B. Yates (3 vols. 1893). Consult Gilchrist's 'Life' (1863), and 'Works' by Swinburne (1868), and Story (1893).

Blake, William Phipps, American mineralogist: b. New York, 1 June 1826. Graduating at the Sheffield Scientific School in 1852, he joined the United States Pacific Railroad exploring expedition (1853) as mineralogist and geologist. In 1861 he became mining engineer for the Japanese government, and with R. Pumpelly organized the first school of science in Japan. As an expert in his specialty he was connected in important capacities with the Paris Exposition of 1867, the Vienna Exposition (1873), United States Centennial Exhibition (1876), Paris Universal Exposition (1878), and drafted the system of classification of United States ores and minerals at the Columbian Exposition (1893). He has conducted important explorations in Alaska, California, and Nevada, and the chief mining districts of the United States, frequently publishing his results in valuable reports and scientific papers. Publications: 'Silver Ores and Silver Mines' (1861); 'California Minerals' (1863); 'Production of the Precious Metals' (1867); 'Iron and Steel' (1873); 'Ceramic Art and Glass' (1878); 'History of the Town of Hamden, Conn.'; 'Life of Captain Jonathan Mix.'

Blake, William Rufus, American actor: b. Halifax, N. S., 1805; d. Boston, 22 April 1863. His first appearance on the American stage was at the old Chatham Theatre, New York, under the management of Mr. Barrere, in 1824, as Frederic in 'The Poor Gentleman,' and in Elliston's favorite character in 'The Three Singles.' His success was great. Jesse Rural, in 'Old Heads and Young Hearts,' was one of his best parts. Mr. Blake was a fluent and effective speaker. He was stage manager of the Tremont Theatre, Boston, joint manager of the Walnut Street Theatre, Philadelphia, and stage manager of the Broadway Theatre, New York.

Blakeley, Johnston, American naval officer: b. near Seaford, County Down, Ireland,

October 1781; lost at sea, 1814. His father emigrated to the United States in 1783, and eventually made his home in Wilmington, N. C. Johnston graduated at the University of North Carolina in 1800, and on 5 February of that year entered the navy as midshipman, and rose to the rank of captain. On 1 May 1814 he left Portsmouth, N. H., in command of the new sloop-of-war Wasp, and very shortly appeared in the English Channel, spreading terror among the merchant ships and seaport towns. On 28 June he fought and defeated the British sloop Reindeer, for which exploit Congress voted him a gold medal. On 1 September he destroyed the Avon and on the 21st, near the Azores, took the Atlanta, which he sent home to Savannah. On 9 October the Wasp was spoken by the Swedish bark Adonis; and that was the last ever heard of the vessel and of those on board of her. It seems probable that, being heavily armed and sparred, the vessel foundered in a gale.

Blakelock, Ralph Albert, artist: b. New York, 15 Oct. 1847. He graduated at the College of the City of New York in 1867, and it was intended that he should follow his father's profession of medicine, but he developed a strong taste for music and the arts, and without a master taught himself painting. He has painted landscapes, moonlight scenes, and Indian figures; one of the last-named represents the Ta-vo-kok-i, or circle-dance of the Kavavite Indians. His work is very striking on account of its harmonious color-schemes. His studio is in New York.

Blakesley, Joseph Williams, English clergyman: b. London, 6 March 1808; d. Lincoln, 18 April 1885. He graduated at Trinity College, Cambridge, in 1831; was Fellow there 1831-45, and select preacher 1840-3; became a member of the New Testament Committee on Bible Revision in 1870; became dean of Lincoln in 1872. His publications include 'Life of Aristotle' (1839); 'Conciones Academicæ' (1843); and an edition of 'Herodotus' (2 vols., 1852-4).

Blakey, Robert, English writer: b. Morpeth, Northumberland, 18 May 1795; d. Belfast, 26 Oct. 1878. He bought the Newcastle *Liberator* in 1838, and got himself into trouble with the government on account of certain alleged seditious articles which he published. In 1848 he became professor of logic and metaphysics at Queen's College, Belfast. Among his works are 'Treatise on the Divine and Human Wills'; 'History of Moral Science'; 'Historical Sketch of Logic'; 'Temporal Benefits of Christianity'; and 'The Angler's Song Book.'

Blanc, blôn, Anthony, American clergyman: b. Sury, France, 11 Oct. 1792; d. New Orleans, 20 June 1860. He was ordained to the Roman Catholic priesthood in 1816; went to Annapolis, Md., in 1817; was appointed bishop of New Orleans in 1835; and became archbishop there in 1850.

Blanc, Jean-Joseph-Louis, zhôn-zhō-sěf-loo-ë, French historian, publicist, and socialist: b. Madrid, 29 Oct. 1811; d. 6 Dec. 1882. He studied with great success in the college at Rodez, and completed his education at Paris. He was for a short time an attorney's clerk, afterward a teacher of mathematics and a private tutor. Subsequently at Paris he devoted him-

self to the career of journalism, fighting stoutly in the ranks of the militant democracy. In 1839 he founded the *Revue du Progrès*, in which first appeared his great work on socialism, 'De l'Organisation du Travail' (separately published in 1840). In this work he condemns individual and competitive rivalry in labor; society should not be subjected to a perpetual combat, but should form a harmonious whole, in which each member should contribute according to his abilities and be recompensed according to his needs. In 1841-4 appeared his 'Histoire de Dix Ans' (1830-40), in which he vigorously exposed the trickery and jobbery of the government of Louis Philippe, and which greatly contributed to bring about its downfall. On the outbreak of the revolution of 1848 Blanc was elected a member of the provisional government, and appointed president of the commission for the discussion of the question of labor. He has been unjustly charged with creating and organizing the disastrous scheme of national workshops, a scheme which he strenuously opposed. After the closing of these workshops, and the June insurrection of 1848, he was prosecuted for conspiracy, but escaped to England, where he took up a lengthened residence. During this period he wrote the bulk of his famous 'Histoire de la Révolution Française' (12 vols. 1847-62). His other works are: 'Lettres sur l'Angleterre' (1865-7); 'Histoire de la Révolution de 1848' (1870); 'Questions d'Aujourd'hui et de Demain' (1873-4); etc. On the downfall of the second empire (1870) Blanc returned to Paris and became a member of the National Assembly in 1880.

Blanc, Ludwig Gottfried, lood'vīg got'frēd, German philologist; b. Berlin, 19 Sept. 1781; d. Halle, 18 April 1866. He was educated at the French Theological Seminary in Berlin and ordained as pastor at Halle. In 1811 he was accused of taking part in a conspiracy against the king of Westphalia, and was imprisoned at Magdeburg, and later at Kassel, until released in 1813 by a Russian skirmishing corps. He was chaplain in the Prussian army in the war of 1814-15; from 1822 was professor of the Romance languages at the University of Halle; and in 1860 was appointed preacher at the cathedral in that city. He was an authority on the Romance languages and especially on the works of Dante. In connection with his study of Dante he wrote a 'Dante Vocabulary' (in French); 'Attempt at a Philological Explanation of Several Disputed Points in the "Divine Comedy"'; and translated the 'Divine Comedy' into German. He has written also 'Grammar of the Italian Language'; and a 'Handbook of the Most Remarkable Facts of Nature and the History of the Earth and Its Inhabitants.'

Blanc, Marie Thérèse, mā-rē tā-rāz (THÉRÈSE BENTZON), French novelist and littérateur; b. Seine-Port, 21 Sept. 1840. She has been for many years on the editorial staff of the 'Revue des Deux Mondes,' to which she has contributed notable translations and reviews of many American, English, and German authors. Her literary essays on these contemporaneous writers were collected in 'Foreign Literature and Customs' (1882), and 'Recent American Novelists' (1885). Her first work to attract attention was 'A Divorce' (1871), published in

the 'Journal des Débats.' Two other novels, 'A Remorse' (1879), and 'Tony' (1889), were crowned by the French Academy. Other stories are 'Georgette' and 'Jacqueline' (1893); 'Condition of Woman in the United States' (1895).

Blanc, Paul Joseph, pōl zhō-zef, French genre painter; b. Paris 1846; d. Paris 5 July 1904. He studied under Bin and Cabanel. He won the Grand Prix de Rome in 1867; the first-class medal of the Paris Salon in 1872; the decoration of the Legion of Honor in 1878; and the first-class medal in the Paris Exposition of 1889. One of his best-known works is a decorative composition depicting the consecration, baptism, and triumph of Clovis.

Blanc, Mont. See MONT BLANC.

Blanchard, blān-shard, Edward Laman, English dramatist and novelist; b. London, 1820; d. 1889. His novels, 'Temple Bar' and 'A Man Without a Destiny,' evinced no special talent for story-telling; on the other hand he composed for Drury Lane Theatre about 100 Christmas pantomimes in the vein of grotesque burlesque, among them 'Sinbad the Sailor,' which were received with unbounded popular favor.

Blanchard, Emile, ā-mēl blōn-shār, French naturalist; b. Paris, 6 March 1819. He is especially renowned as an entomologist, and is the author of many scientific works, including 'Researches into the Organization of Worms' (1837); 'Natural History of Orthopterous and Neuropterous Insects' (1837-40); 'History of Insects, etc.' (1843-5).

Blanchard, François, frān-swā, French aeronaut; b. 1753; d. 1809. He displayed great ingenuity by the invention of a hydraulic machine in the 19th year of his age, and afterward in the construction of a flying ship, which, by means of a counterpoise of six pounds, was raised to more than 20 feet from the ground. He eagerly availed himself of the discoveries of the brothers Montgolfier, and the improvements of the same by Prof. Charles and M. Robert in Paris. After having made his first aërostatic voyage, 4 March 1784, he crossed the Channel from Dover to Calais, 1785, with Dr. Jeffries, a gentleman of Boston. For this exploit he was rewarded by the king of France with a present of \$2,400 and a pension of \$240. In the same year, at London, he first made use of a parachute invented by him, or, according to others, by Etienne Montgolfier. After having performed many aërostatic voyages in foreign countries also, he was accused of propagating revolutionary principles, and imprisoned (1793) in the fortress of Kufstein, in the Tyrol. Having obtained his liberty, he made his 46th ascent in the city of New York in 1796. In 1798 he ascended with 16 persons in a large balloon at Rouen, and descended at a place 15 miles distant. In 1807 his aërostatic voyages amounted to more than 66. His wife continued to make aërial voyages. In 1811 she ascended in Rome, and after going a distance of 60 miles she rose again to proceed to Naples. In June 1819 having ascended from Tivoli, in Paris, her balloon took fire at a considerable height, from some fire-works which she carried with her. The car fell in the Rue de Provence, and the aeronaut was dashed to pieces.

BLANCHARD — BLANCHING

Blanchard, Jacques, zhäk, French painter: b. Paris, 1600; d. 1638. He received the first lessons of his art from Bellori, his maternal uncle, studied some time at Lyon, and in 1624 repaired to Rome. After two years he visited Venice, studied the works of Titian and the other great colorists of his school, and executed several paintings which gave him a name. After his return to Paris he executed a great number of works, which procured him the surname of "the French Titian." His best piece, a 'Descent of the Holy Spirit,' is in the cathedral at Nôtre Dame.

Blanchard, Jonathan, American educator: b. Rockingham, Vt., 19 Jan. 1811; d. Wheaton, Ill., 14 May 1892. He graduated at Lane Theological Seminary in 1832 and was ordained a Presbyterian minister in 1838. He was American vice-president of the World's Anti-Slavery Convention in London in 1843; and in 1846 became president of Knox College at Galesburg, Ill. He was president of Wheaton College, Ill., 1880-2; and, on resigning, was chosen president-emeritus, and subsequently gave most of his time to editing 'The Christian Cynosure.'

Blanchard, Thomas, American inventor: b. Sutton, Worcester County, Mass., 24 June 1788; d. 16 April 1864. He joined his brother in the manufacture of tacks by hand, and at the age of 18 commenced his invention of a tack-machine, which in six years he brought to such perfection that by placing in the hopper the iron to be worked, and applying the motive power, 500 tacks were made per minute with better finished heads and points than had ever been made by hand. He sold the patent for \$5,000. About this time various attempts were made in the United States armories at Springfield and Harper's Ferry, to turn musket-barrels with a uniform external finish. Blanchard undertook the construction of a lathe to turn the whole of the barrel from end to end, by the combination of one single self-directing operation. About three inches of the barrel at the breech was partly cylindrical and partly with flat sides; these were all cut by the same machine, ingeniously changing to a vibrating motion as it approached the breech. The superintendent of the Springfield armory contracted with Mr. Blanchard for one of his machines. While it was in operation one of the workmen remarked that his own work of grinding the barrels was done away with. Another, employed on the wooden stocks, which were then all made by hand, said that Blanchard could not spoil his job, as he could not make a machine to turn a gunstock. Blanchard answered that he was not sure, but he would think about it, and as he was driving home the idea of his lathe for turning irregular forms suddenly struck him. The principle of this machine is, that forms are turned by a pattern the exact shape of the object to be produced, which in every part of it is successively brought in contact with a small friction-wheel; this wheel precisely regulates the motion of chisels arranged upon a cutting wheel acting upon the rough block, so that as the friction-wheel successively traverses every portion of the rotating pattern, the cutting wheel pares off the superabundant wood from end to end of the block, leaving a precise resemblance of the model. This remarkable machine, with modifications and improvements, is in use in the

national armories as well as in England, and in various forms is applied to many operations in making musket-stocks, such as cutting in the cavity for the lock, barrel, ramrod, butt-plates, and mountings, comprising, together with the turning of the stock and barrel, no less than 13 different machines. Beside gunstocks, it is also applied to a great variety of objects, such as busts, shoe lasts, handles, spokes, etc. Mr. Blanchard was also interested at an early day in the construction of railroads and locomotives, and in boats contrived to ascend rapid rivers. He also invented a machine for cutting and folding envelopes, a steam wagon, and a process for bending heavy timbers.

Blanche of Bourbon, Castilian queen: b. 1338. She was the daughter of Peter, Duke of Bourbon, and in 1353 married Peter, king of Castile, surnamed the Cruel. Don Frederick, Peter's natural brother, had been deputed to meet her at Narbonne and bring her into Spain, and she is said to have so far forgotten herself as to conceive a violent passion for him. Rumors to this effect had reached the king's ears, and though he celebrated the marriage he soon showed that he had placed his affections elsewhere. He shortly after declared the marriage null, imprisoned the queen in the castle of Medina Sidonia, and is said to have gotten rid of her by poison.

Blanche of Castile, French queen: b. 1187; d. Milan, November 1252. She was the daughter of Alphonso IX., married Louis VIII. of France and became the mother of Louis IX. ("St. Louis"). On the death of her husband she anticipated the formal appointment of a regency by procuring the immediate coronation of her son, and during his minority held the reins of government in his name with distinguished ability and success. In 1244, when St. Louis took his departure for the Holy Land she again became regent and gave new proofs of her talents and virtues. Her days are said to have been shortened by the long absence of her son, and a prevailing rumor that he had resolved to remain permanently in Palestine.

Blanche, August Théodor, ow'goost tã'ô-dôr blänsh, Swedish dramatist and novelist: b. Stockholm, 17 Sept. 1811; d. Stockholm, 30 Nov. 1868. His comedies and farces,—more particularly 'Jenny, or the Steamboat Trip'; 'The Doctor'; 'The Rich Uncle'; and 'The Foundling'—have made all Sweden laugh; while his realistic fictions,—among them 'The Spectre'; 'Tales of a Cabman,' and 'Sons of North and South,'—are eagerly read.

Blan'chet, Joseph Goderick, Canadian statesman: b. Saint Pierre, 1829. He studied medicine, graduating from the College of Saint Anne; but has been especially active in public life; he has been mayor of Lévis, speaker of the Provincial legislature of Quebec for seven years, and member of the Canadian Assembly, from which he resigned on account of the law on dual representation.

Blanching, the process which prevents or checks the formation of chlorophyll and other substances in plants by excluding light. It alters the flavor as well as lightens the color of celery, sea-kale, asparagus, etc., and is generally accomplished by covering the plants with earth, boards, straw, paper, etc., or, in a small way, by inverted flower-pots, kegs, barrels, etc.

Blanco, Antonio Guzman, än-tō'nyō gooz'-mān blān'kō, Venezuelan soldier: b. Caracas, 29 Feb. 1828; d. 29 July 1899. He became prominent in the Federalist revolts, 1859-63, and, when his party triumphed, was made first vice-president in 1863 under Falcon, who was deposed in the revolution of 1868. Blanco led a successful counter-revolution in 1870, became president, and retained the office till 1882. In 1893 he was appointed minister to France, where he resided till his death.

Blanco, Jose Felix, hō'sa fā-lēks, Venezuelan historian: b. Mariana de Caracas, 24 Sept. 1782; d. Caracas, 8 Jan. 1872. At different times he acted in the capacity of priest, soldier, and statesman. He was one of the leaders in the revolution at Caracas, 19 April 1810, and was the first editor of the great historical work, 'Documentos para la historia de la vida publica del Libertador,' etc.

Blanco, Pedro, pā'drō, Bolivian statesman: b. Cochabamba, 19 Oct. 1795; d. Sucre, January 1829. He joined the Spanish army in 1812, but soon deserted to the patriots, and served with them till the end of the revolution. In 1828 he became a general, and in the same year, when Sucre fell, was made president of Bolivia, but was superseded in the revolution of 31 Dec. 1828. He was shot in Sucre.

Blanco, Ramon y Arenas, rā'mōn ē a-rā-nas, MARQUIS DE PENA PLATA, Spanish soldier: b. San Sebastian, Spain, 1833; d. Madrid, 4 April 1906. He began his military career in 1855 as lieutenant; was promoted captain in 1858, and won the rank of lieutenant-colonel in the war with San Domingo. In 1894 Blanco went to the Philippines as governor of Mindanao. When he returned to Spain he was assigned to the Army of the North, and in the war with the Carlists made a brilliant record. He successfully stormed Pena Plata, for which achievement he was created a marquis with that title. He succeeded Gen. Weyler as captain-general in Cuba, and his career was marked by deeds of blood and violence. When in command at the Philippines he ordered 169 prisoners to be thrown into a dungeon, where they were left for two days. When the guard opened the door they were all dead from asphyxiation. In the second Cuban insurrection 1,500 defenseless prisoners were slaughtered by his orders. At Cavité the Spanish captured several native leaders, and, by Blanco's instructions, after being tortured, the unhappy wretches were disemboweled and their bleeding bodies hung on the gates of the city. The Spanish government permitted him to resign his post in Cuba before the day set for the American occupation.

Blanco, Encalada, Manuel, mā-noo-el blān-ko-ēn-kā-lā'da, Spanish-American soldier: b. Buenos Ayres, 5 Sept. 1790; d. 5 Sept. 1875. He distinguished himself in the Chilean war of independence. He was chosen president of Chile in July 1826, but soon resigned and was made general of the army. He unsuccessfully invaded Peru in 1837, and was not allowed to retire till he had signed a treaty of peace. Chile annulled this treaty, and he was court-martialed, but freed. In 1847 he was intendant of Valparaiso, and in 1853-8 minister to France.

Blanco, blān'kō, Cape (literally, "white cape"), a name given to a great number of capes by the Spaniards, Portuguese, and Italians. It corresponds to the French *cap blanc*. The name is as common and as unphilosophical as that of White Hill, Black River, etc. The cape best known by this name is a headland on the west coast of Africa, in lat. 20° 47' N., and lon. 16° 58' W., the extremity of a rocky ridge which projects from the Sahara in a westerly direction, and then bending southward forms a commodious harbor called the Great Bay. Cape Blanco was first discovered by the Portuguese in 1441.

Bland, Edith Nesbit (E. NESBIT), English writer: b. London, 15 Aug. 1858. She was married to Hubert Bland, 1879. She has written several volumes of verse, as well as a series of popular children's books and several novels. Her published works include: 'Lays and Legends' (1886-92); 'Leaves of Life' (1888); 'A Pomander of Verse' (1895); 'Grim Tales' (1893); 'Something Wrong' (1893); 'The Marden Mystery' (1896); 'Songs of Love and Empire' (1897); 'The Secret of Kyriels' (1898); 'The Story of the Treasure Seekers' (1899); 'Pussy and Doggy Tales' (1899); 'The Book of Dragons' (1900); 'The Would-be Goods' (1901); 'Nine Unlikely Tales'; 'Thirteen Ways Home' (1901); 'Five Children and It' (1902); 'The Red House' (1902); with Hubert Bland, 'The Prophet's Mantle' (1889); with Barron, 'The Butler in Bohemia' (1894).

Bland, Richard Parks, American legislator: b. near Hartford, Ky., 19 Aug. 1835; d. Lebanon, Mo., 15 June 1899. He received an academical education, and, between 1855 and 1865, practised law in Missouri, California, and Nevada, and was engaged for some time in mining. In 1865 he settled in Rolla, Mo., and practised there till he removed to Lebanon in the same State. He was a member of Congress in 1873-95 and from 1897 till his death. In 1896 he was a conspicuous candidate for the presidential nomination in the Democratic National Convention, but on the fourth ballot his name was withdrawn, and the vote of his State was cast for William J. Bryan. Mr. Bland was best known as the leader in the Lower House of Congress of the Free-Silver movement, and the author of the Bland Silver Bill. At the time of his death he was a member of the committees on coinage, weights and measures, and expenditures on public buildings.

Bland, Theodoric, American military officer: b. Prince George County, Va., 1742; d. 1 June 1790; he studied medicine in the University of Edinburgh, and for a time practised in England. He returned home in 1764, wrote against Gov. Dunmore under the name of Cassius; and was active in his profession until the outbreak of the Revolutionary War, when he sided with the Colonists, and became captain of the first troop of Virginia cavalry. In 1777 he joined the main army as a lieutenant-colonel, and later became a colonel. He distinguished himself at the battle of Brandywine, and was placed in command of the prisoners taken at Saratoga, who were marched to Charlotteville, Va. In 1780-3 he was a member of the Continental Congress, and was a representative from Virginia to the First Federal Congress in 1789.

Blank Verse, verse without rhyme. This was the invariable form of the poetry of the ancients, but it is now peculiar to the Italian, English, and German languages. The poetry of the Anglo-Saxons and the earliest English poetry was not rhymed, yet it is not generally called blank verse, as their versification had a peculiarity of its own called alliteration. When rhyme, however, was once introduced into English verse, it was for a long time regarded as the exclusive form of versification, and the Earl of Surrey, who was beheaded by order of Henry VIII. in 1547, is said to have been the first to use blank verse in England, namely, in his translation of the second and fourth books of Virgil's 'Æneid.' The most common form of blank verse in English poetry is the decasyllabic, such as that of Milton's 'Paradise Lost' and the dramas of Shakespeare. From Shakespeare's time it has been the kind of verse almost universally used by dramatic writers. Dryden, indeed, after the Restoration, introduced rhyme into his tragedies, in imitation of the French rhymed plays; but after keeping the stage for a number of years, they became intolerable to the English ear, and the introduction of rhyme into the drama has never since been attempted in England. Shakespeare not uncommonly ends a scene with a few lines of rhyme, although the rest of the scene is in blank verse, and in the subordinate play interwoven with the action of Hamlet blank verse is used throughout. The first use of the term blank verse is said to be in Hamlet, ii. 2: "The lady shall say her mind freely, or the blank verse shall halt for't."

Blanket (that is "fine white" goods), a heavy bed or horse cover, of a fabric with a thick soft nap on both sides. Originally made entirely of wool, and still so in the finest grades, the bulk of medium and cheap blankets are now made with a cotton chain or warp and a wool filling, as cheaper, stiffer, and little less durable in good condition. In the finest grades of American blankets, the filling is Australian wool, the longest and softest fibre known; the warp of American wool. The cheapest ones have for filling the shorter combings of wool, shoddy, etc.; ordinary horse blankets the same or still coarser half-cleaned wool, and largely animal hair. Of late also an immense quantity of all-cotton blankets are made, the nap being cotton wool; these have competed less with wool blankets than with comfortables, whose sale for a time they cut in half. They are used for economy, where heavy blankets are not needed, and to replace cotton sheeting in cold rooms, for children, etc. The most famous blankets in the world are those of the Mysore in India, so delicate that one 18 feet long can be rolled inside a hollow bamboo. In the United States they are a specialty in southwestern Indian domestic manufacture, especially among the quite civilized Navajos (q.v.), whose rough hand looms and stick shuttles turn out blankets weighing 20 pounds or more, and selling for \$1 and \$2 a pound, much prized by Alaskan and Klondike gold-seekers. But of civilized manufacture, the finest are from California, Nevada, and Oregon, and from Minneapolis; some of these retail for \$25 per pair with a weight of less than 10 pounds. Maine, Ohio, and West Virginia also produce very fine goods. Below the above fancy price, of which

much is loading for short runs, prices range for all-wool blankets from \$20, the highest usually kept in stock, down to \$7.50, and for cotton-warp down to \$2, all-cotton, \$1. Few blankets have been imported into this country since 1860. The early manufacture here was "a series of costly and futile experiments," except a few coarse ones for army or navy use, and for slaves on plantations, for which in 1831 a mill was started in Pendleton, S. C.; another to make "Indian" blankets was opened in Buffalo the same year. But the first effective attempt was under the sharp tariff of 1842, soon swept away by the moderate one of 1847. The tariff bill of 1857, however, which formed one of the southern counts for secession, taxed imported blankets so heavily that by 1861 importations had practically ceased. In 1860 the United States' total manufacture was 616,400 pairs, mainly in New England, Pennsylvania, and California. In 1880 this had increased to 4,400,000, gross value \$6,840,000, and the prices had dropped so much that the cheaper grades had gone out of use; the foreign commissioners at the Centennial of 1876 reported that for weight, thickness, softness, and perfection of surface, nothing in Europe compared with the American, and that the European cheaper grades could not be sold even to the Indians. But competition had so glutted the market that in 1878 a great auction was held in New York to clear them off, at heavy sacrifice. In 1890 the manner of report was changed to square yards,—20,793,644 of "house blankets," valued at \$7,153,900, and 5,507,074 of horse blankets, \$1,721,516. For some reason, probably the larger use of comfortables, the use of the all or part-wool article fell off heavily in the last decade—to 18,155,505 square yards, valued at \$5,200,959; though horse blankets increased to 7,315,304, valued at \$1,740,988 or about the same as before. The chief seats of manufacture were Pennsylvania for all-wool, and Massachusetts for cotton-warp, though Indiana, Minnesota, California, and several other States furnished large quantities.

The nap is formed in the finest grades, and till recently was so altogether, by pulling up the fibre with teazles; these have now been replaced in the cheaper makes with steel teeth or brushes on revolving cylinders, which, however, are too inflexible and liable to tear the goods to be trusted with expensive ones. The use of Jacquard patterns with two or three colors, in place of printed ones, is another change which has popularized blankets by increasing their beauty.

Blanqui, blăn-ķe, **Jérôme Adolphe**, French economist: b. Nice, 1798; d. 1854. While studying medicine at Paris he made acquaintance with Jean Baptiste Say, and was induced to devote himself to the study of economics. He succeeded Say in the Conservatoire des Arts et Métiers as professor of industrial economy. Blanqui, who favored a free-trade policy, published, among other works, 'Précis Élémentaire d'Économie Politique' and 'Histoire de l'Économie Politique en Europe.'

Blanqui, Louis Auguste, French revolutionist: b. Nice, 7 Feb. 1805; d. 1 Jan. 1881. He made himself conspicuous chiefly by his passionate advocacy of the most extreme political opin-

BLANQUILLO — BLASPHEMY

ions, for which he suffered with the pride of a martyr. He was one of the foremost fighters in all the French revolutions of the 19th century. In 1830 he was decorated for his valor at the barricades. In 1848 he figured as the chief organizer of the popular movement under the provisional government. He took the lead also in the revolutionary *attentat* of 15 May, the aim of which was to overthrow the Constituent Assembly. At the head of an excited mob he demanded of the French representatives the resuscitation of the Polish nationality, while one of his friends pronounced the dissolution of the Assembly. For his share in these disturbances he was rewarded with a 10 years' imprisonment in Belleisle. In 1861 Blanqui was sentenced to another imprisonment of four years. After the downfall of the second empire in 1870, Blanqui resumed his revolutionary activity, and, in 1871, took a prominent part in forming the Commune. Being too unwell to endure transportation to New Caledonia, he was condemned to imprisonment for life, from which he was released in 1879. He spent nearly half of his life in prison.

Blanquillo, blan-kél'yō, a fish of the Gulf of Mexico (*Caenolatilus chrysops*), related to the tile-fish. The name is also given in southern California to the yellow-tail (q.v.).

Blarney, Ireland, a village four miles northwest of the city of Cork, near the stream of same name, here crossed by a handsome bridge of three arches. It is a small but well-built place; and besides the parish church, contains a national school. Flax and cotton were formerly manufactured to some extent, but both of these branches have now decayed. Spinning and dyeing woolen yarn is, however, still carried on; and there is an extensive tweed manufactory employing a number of people. Blarney Castle stands on an isolated limestone rock at the junction of the Blarney and Comane. Erected in the 15th century, it was the scene of several interesting historical events; but derives its chief notoriety from a stone in its northeast angle, several feet from the top, bearing a Latin inscription, recording the date of the erection, and called the "Blarney Stone." To this stone tradition ascribes the faculty of communicating to all who kiss it that species of most persuasive fluency of speech commonly called "blarney." The "groves of Blarney" are extensive and interesting, and beneath the castle there are also some curious natural caves.

Bläser blé'zér, **Gustav**, German sculptor: b. Düsseldorf, 9 May 1813; d. Cannstatt, 20 April 1874. He was associated 11 years with Rauch and for that time shared in all his work. In 1845 he went to Rome, but returned to Berlin when appointed to design one of the groups for the "Schlossbrücke." His group, 'Minerva Leading a Young Warrior to Battle,' is thought to be the best of the series. Among his other works are a statue of St. Matthew in the church at Helsingfors; the 'Prophet Daniel'; Barussia in the new museum at Berlin; the statues of Jeremiah, Daniel, and Charlemagne for the church at Potsdam; the equestrian statue of Frederick William III. at Cologne; 'Hospitality'; and many busts, including one of Lincoln and one of Washington.

Blashfield, **Edwin Howland**, American artist: b. New York, 15 Dec. 1848; studied in Paris under Léon Bonnat; and began exhibiting

in the Paris Salon in 1874. He returned to the United States in 1881, and has since distinguished himself by the execution of large decorative works. Among his noteworthy productions in this line are one of the domes of the Manufacturers' building in the World's Columbian Exposition, the great central dome of the Library of Congress, and the new apartment of the appellate court in New York; besides ceiling and panel work in the residences of C. P. Huntington, W. K. Vanderbilt, and George W. C. Drexel, and in the Astoria ballroom and several clubhouses in New York.

Bla'sius, **St.**, or **St. Blaise**, Bishop of Sebaste, in Armenia, is said to have suffered martyrdom about 316, by order of Agricola, governor of Cappadocia and little Armenia. His feast day is celebrated in the Greek church on 11 February and he is commemorated in the oldest martyrologies of the Roman church. In the Roman Martyrology, 3 February is assigned to him. He is the patron saint of wool-combers, his flesh having been torn by iron combs. He is especially invoked in diseases of children and animals, and ailments connected with the throat are more particularly in his province.

Blasphemy, is somewhat variously defined. According to the most general definition, it means the speaking irreverently of the mysteries of religion; and formerly, in Roman Catholic countries, it also included the speaking contemptuously or disrespectfully of the Holy Virgin or the saints. Public blasphemy has been considered by the Catholic Church as an unpardonable sin, and it was formerly punished with death by the municipal laws. The 77th novel of Justinian assigned this punishment to it; and the capitularies inflicted the same punishment upon such as, knowing of an act of blasphemy, did not denounce the offender. The former laws of France punished this crime with fine, corporal punishment, the gallows, and death, according to the degree and aggravation of the offense. The records of the parliaments supply numerous instances of condemnation for this crime, and many of punishment by death; others of branding and mutilation. A man was for this offense condemned to be hanged, and to have his tongue afterward cut out, and the sentence was executed at Orleans as late as 1748. But it is remarked by a writer in the French 'Encyclopédie Moderne,' that we should form an erroneous opinion from the present state of society of the effect of this offense, and the disorders it might introduce in former times; for religion was once so intimately blended with the government and laws, that to treat the received articles of faith or religious ceremonies with disrespect was in effect to attack civil institutions.

By the common law of England, as stated by Blackstone, blasphemy consists in denying the being and providence of God, contumelious reproaches of Jesus Christ, profane scoffing at Holy Scripture, etc., and is punishable by fine and imprisonment, or corporal punishment; the offense is also statutory, the statute 9 and 10 William III. cap. xxxii., declaring that if any one shall deny any of the persons of the Trinity to be God, or assert that there are more gods than one, or deny the truth of Christianity or of the Scriptures, he shall be incapable of holding any office; and for a second offense be

BLAST FURNACE

disabled from suing any action, or being an executer, and suffer three years' imprisonment.

By the law of Scotland, as it stood under acts of 1661 and 1695, the punishment of blasphemy was death. Blasphemy consisted of railing at or cursing God, or of obstinately persisting in denying the existence of the Supreme Being, or any of the persons of the Trinity.

The early legislation of the American colonies followed that of the mother country, and in some of them the crime of blasphemy was punished with death; but the penalty was mitigated before the establishment of independence, and imprisonment, whipping, setting on the pillory, having the tongue bored with a red-hot iron, etc., were substituted. Several penalties against blasphemy are to be found in the laws of some of the New England States, according to which it is provided that, if any person shall blaspheme, by denying, cursing, or contumeliously reproaching God, his creation, government, or final judging of the world, or by cursing or reproaching Jesus Christ or the Holy Ghost, or contumeliously reproaching the Word of God, consisting of the commonly received books of the Old and New Testament, he is liable to imprisonment for a term not exceeding five years. But the most direct and public violations of these laws are passed over without punishment or prosecution, due probably to the provisions of the National and State Constitutions, guaranteeing religious liberty, and the freedom of speech. In many States, the offense of blasphemy, not being a subject of special statutory provision, is only punishable either as an offense at common law, or a violation of the statute laws against profane swearing.

Blast Furnace, a modern mechanical appliance, or structure built of refractory material in which metallic ores are smelted in contact with fuel and flux, the combustion of the fuel being accelerated by air under pressure. The materials are fed in at the top of the furnace, and after the ores are reduced, the metal, or in some cases the matte, and the resulting slag are tapped in a molten state at or near the bottom; as a rule, the slags, being of less specific gravity than the metal, float upon it. The sizes of blast furnaces vary from a few feet to over 100 feet in height, a horizontal section through the structure showing either circular or rectangular interiors, the circular form being adopted for the larger sizes, while those of smaller height are often made rectangular to permit of introducing a number of tuyeres with air nozzles into a narrow hearth.

A vertical section of a modern American blast furnace shows at the lower part, the hearth or crucible of the shape desired, into which the air is admitted under pressure through tuyeres. On this hearth is superposed an inverted frustum of a cone forming the boshes, and above these the shaft of the furnace ascends in the form of a right cone. The shafts are inclosed by shells of sheet steel or by crinolines formed of bands and beams, and carried on columns. The boshes are usually secured by bands and the crucibles by sheet and metal jackets. The materials are charged into the shaft so that layers of fuel alternate with layers of ore and flux, the taper of the shaft being sufficient to permit of expansion as the materials are heated, and facilitate their delivery to the hopper formed by the boshes,

where reduction of the ores takes place. The reduced ore, meeting the burning fuel near the tuyeres, is melted, and the liquid slag and metal drop into the hearth or crucible (the cinder or slag floating on the liquid metal), from which they are tapped out from time to time. By heating the blast before it enters the tuyeres combustion is accelerated, and the furnaces produce increased quantities of metal with reduced fuel consumption per unit of product.

The large blast furnaces smelt ores of iron or manganese, or of iron and manganese, and are from 40 to 106 feet in height, a cross section at the top of the boshes showing a circle from 10 feet to 23 feet in diameter. The blast is heated to 1,000°, and sometimes to 1,200°, or 1,400° F., and is forced into the crucibles or hearth through from 6 to 20 tuyeres, at pressures from 5 to 15, and, at times, exceeding 20 pounds per square inch. The blast furnaces smelting silver or copper ores seldom exceed 30 feet in height, the horizontal section being rectangular, and the blast pressure but a fraction of a pound. A modern blast furnace will produce from 300 to 600 tons of pig iron daily, requiring from 1,000 to 2,000 tons of ore, fuel and flux to be fed into it. The cost for construction and equipment of one of these modern furnaces, with its necessary railroad tracks, storage room and bins for receiving the raw material, the mechanism for elevating it to the top of the stack, with sufficient blowing engines, boilers, hot blast stoves, etc., ranges from \$400,000 to \$800,000.

As a rule, blast furnaces smelting other ores than those of iron have the top of the furnace stack open, while, in those producing iron, the top is usually sealed by a bell closing against a hopper, to distribute the stock in the wide throat of the furnace and to control the gases which are the result of the smelting operation, so as to employ the calorific value of these gases for heating the blast or for generating steam in boilers to operate machinery. The practicability of using these gases in engines, where the gas, in exploding, gives impetus to a piston, has also been demonstrated. The blast is heated in hot blast stoves, generally cylinders from 14 to 25 feet in diameter and from 50 to 115 feet high, filled with checker work of fire brick. These stoves are placed in series; the gas being admitted to and burned in a stove raises the temperature of the masonry, after which the gas is shut off and the blast forced through the highly heated checkers. By alternating a series of stoves on gas or blast, at intervals of one or two hours, a nearly uniform temperature is maintained.

The blast, after passing through the hot blast stoves, is conveyed in iron or steel conduits, lined with fire brick, to tuyeres, set in the walls of the crucible. These tuyeres are formed of an inner and outer shell with closed ends, water circulating between the two shells. The tuyeres are mostly made of bronze or copper and are set in larger tuyere blocks (also water cooled) of iron or bronze. Nozzles connect the lined air conduits to the tuyeres. The cooling water required by a modern blast furnace amounts to millions of gallons daily. A large furnace requires a boiler equipment of from 3,000 to 3,500 horse power for its blowing, pumping and elevating machinery, electric plant, etc.

MODERN BLAST FURNACE, SHOWING AUTOMATIC HOISTING AND CHARGING EQUIPMENT.

BLASTING — BLAUBOK

Blast furnaces are numerous in Great Britain, Germany, France, Belgium, Spain, Russia, Austria-Hungary, Sweden, and they also exist in Canada, Mexico, Italy, China, India and Japan. Data as to the number of these is not at hand, but the following statement of the pig iron production of various countries gives an approximate idea:

Country.	Production in 1901. Tons.
United States	16,132,408
Great Britain	7,886,019
Germany and Luxemburg	7,835,204
France	2,567,388
Russian Empire	2,221,710
Austria-Hungary	1,427,240
Belgium	765,420
Sweden	528,375
Spain	295,840
Canada	248,896
Japan	57,673
Italy	8,333

It is impossible to give the total number of blast furnaces in the United States, for the reason that the number of those used for producing copper, silver, etc., are not collated, but lists of the furnaces employed in reducing iron ores are carefully reported by the American Iron and Steel Association. There were, in 1901, in the United States, a total of 411 blast furnaces, whose aggregate reported capacity amounted to 19,000,000 long tons of pig iron, but as all of these furnaces are not active at one time, it is more equitable to consider the practical production as between that reported and the greatest annual output, which, in 1901, amounted to 16,132,408 long tons. See STEEL MANUFACTURE.

Blasting, the technical term for splitting and breaking up any object by means of gunpowder or some of the other powerful explosives now in use. The operation, which is of extensive use in quarrying, mining, and other branches of engineering, is often performed by boring a hole in the substance to be exploded, by means of an iron rod, called a jumper, filling it with gunpowder, and igniting this by means of a match, burning so slowly as to allow the parties employed to remove to a sufficient distance before the explosion takes place. At one time it was supposed that the force of the explosion depended on the firm packing of the gunpowder in the hole by means of small chips of stone, sand, etc. It has since been ascertained that loose sand is as effectual as firm packing, which in consequence has been generally laid aside. One of the most important modern improvements in blasting is the firing of the charge by electricity. This mode is more especially applicable to submarine blasting, and was first practised for that purpose by Gen. Pasley, in 1839. The only thing necessary is to make an interruption in the conducting wire at the point where the explosion is to take place. In passing the electric current, a spark produced at the interruption fires the charge. The effect being instantaneous the operator can fire any number of charges simultaneously. Gun-cotton is often employed in blasting, and nitro-glycerine has also been found to be a very powerful agent in such operations, but its use requires the utmost caution, as it is very liable to explode unexpectedly with most disastrous results. The same objection does not apply to dynamite, which is quite as effective and perfectly harmless when properly handled.

One of the greatest blasting operations ever attempted was the removal of the reefs in the East River, near New York, known as Hell Gate. An entrance shaft was sunk on the Long Island shore, from which the reef projected. From this shaft nearly 20 tunnels were bored in all directions, extending from 200 to 240 feet, and connected by lateral galleries. Upward of 52,000 pounds of dynamite, rend rock, and powder were used, and millions of tons of rock were dislodged. Numerous important improvements have been made in blasting by the substitution of rock boring machines for hand labor. Of such machines, in which the jumper or drill is repeatedly driven against the rock by compressed air or steam, being also made to rotate slightly at each blow, there are many varieties. See also EXPLOSIVES.

Blastomeryx. See MERYCODUS.

Blatchford, Samuel, jurist: b. New York, 9 March, 1820; d. Newport, R. I., 7 July 1893. He graduated at Columbia, 1837; became secretary to Gov. W. H. Seward of New York, and practised law at Auburn, N. Y., as a member of the governor's firm, 1845-54. In 1854 he settled in New York as head of the firm of Blatchford, Seward, & Griswold. Though he attained success in general practice, it was his application to admiralty law that gave him his widest repute. On 3 May 1867 he was appointed judge of the United States district court for the Southern district of New York; in March 1878, judge of the United States circuit for the second circuit; and in March 1882 he became an associate justice of the United States supreme court. Here he continued to give close attention to admiralty cases, and also rendered important decisions on bankruptcy, copyright, patent, and libel causes. Publications: 'Reports of Cases in Prize in the Circuit and District Courts for the Southern District of New York 1861-5' (1866); 'Reports of Cases in the Circuit Court of the United States, Volumes 4-6' (1867-9); 'Circuit Court Reports for the Second Circuit, 1847-75' (12 vols. octavo); 'Reports of the Circuit Courts of the United States, Second Circuit, Volumes 13-20' (N. Y. 1877-83, 8 vols.); with F. Howland and E. R. Olcott, 'United States District Court Reports (Admiralty Cases Decided by Judge Betts) for the Southern District of New York, 1827-47' (N. Y., 2 vols. octavo).

Blatchley, Willis Stanley, naturalist: b. Madison, Conn., 6 Oct. 1859. He graduated at Indiana State University 1887, and was successively an assistant on the Arkansas Geological Survey 1889-90, a member of Scoville's scientific expedition to Mexico 1891, and assistant on the United States Fish Commission in 1893. In 1894 he was elected State geologist of Indiana, and re-elected 1898. Besides his annual reports his scientific writings include: 'Gleanings from Nature' (1899); 'Locustidæ and Blatidæ of Indiana' (1892); 'Some Indiana Acrididæ' (1891-8); and 'Descriptions of New Species of Orthoptera.'

Blat'tidæ. See COCKROACH.

Blaubok, blow'bök, a large antelope of South Africa (*Hippotragus niger*). It is of a

bluish hue, and has long, stout horns which sweep back from its forehead like those of its relatives, the isabel and equine antelopes. It formerly occurred in large herds, but had a limited habitat, and is now probably extinct.

Blauvelt, blow'vêlt, **Mme. Lillian Evans** (MRS. W.M. F. PENDLETON), prima donna: b. Brooklyn, N. Y., about 1870, of Welsh and Dutch ancestry. When eight years old she made her début as a violinist. She studied (voice) with M. Jacque Bouhy, of Paris, for three years. Her début in opera was made at the Theatre de la Mornari, Brussels, and she has taken the principal roles in 'Faust,' 'Romeo and Juliet,' 'Myna,' etc. Of late her work has been chiefly in concert and oratorio. Besides Great Britain, Canada, and the United States, she has sung in Russia, Germany, France, Italy, Holland, Belgium, Austria-Hungary, and Switzerland.

Blavatsky, bla-väts'kê, **Helene Petrovna**, Russian theosophist: b. Yekaterinoslay, Russia, 1831; d. London, 8 May 1891. She traveled in all parts of the world and succeeded in entering Tibet. In 1873 she came to the United States, founded the Theosophical Society in New York, and aided in establishing 'The Theosophist.' She studied the East Indian esoteric doctrines and Buddhist philosophy, and by her writings contributed to make this philosophy popular. She wrote 'Isis Unveiled'; 'The Secret Doctrine'; 'Key to Theosophy.' See THEOSOPIHY.

Blazing Star. Various hardy perennial plants. See LIATRIS.

Blazonry, the art of describing a coat of arms in such a way that an accurate drawing may be made from the verbal statements given. To do this a knowledge of the points of the shield is particularly necessary. Mention should be made of the tincture or tinctures of the field; of the charges which are laid immediately upon it, with their forms and tinctures; which is the principal ordinary, or, if there is none, then which covers the fess point; the charges on each side of the principal one; the charges on the central one, the bordure—with its charges; the canton and chief, with all charges on them; and, finally, the differences or marks of the cadency and the baronet's badge.

Bleaching (Fr. *blanchiment*, "whitening"), the process of removing the coloring matters from fabrics of cotton, linen, wool, silk, etc., or from the raw materials, and also from straw, wax, and other substances, and leaving them perfectly white. Steeping cloths in lyes extracted from the ashes of plants, appears to have been practised by the ancient Egyptians for this purpose. In modern times the Dutch have almost monopolized the business, at least till within about 100 years. Previous to this time the brown linens manufactured in Scotland were regularly sent to Holland to be bleached. A whole summer was required for the operation; but if the cloths were sent in the fall of the year, they were not returned for 12 months. It was this practice which caused the name of Hollands to be given to these linens. The Scotch introduced the business of bleaching for themselves about the year 1749; but it was long believed that the peculiar properties of the water about the bleaching grounds of Haarlem gave to this neighborhood advantages which no other region could possess. The use of chlorine as a bleaching agent was first proposed by Ber-

thollet in 1785, and shortly afterward introduced into Great Britain, where it was first used simply dissolved in water, afterward dissolved in alkali, and then in the form of bleaching powder, commonly called chloride of lime, the manufacture of which was suggested by Mr. Tennant, of St. Rollox, Glasgow, in 1798. At first he passed the chlorine into milk of lime, and thus obtained the solution known as bleach liquor. In 1799 he took out a patent for absorbing chlorine by dry lime, and thus obtained bleaching powder. Bleaching powder has little bleaching action till the chlorine is liberated by the action of an acid. The best bleaching powder contains about 36 per cent of available chlorine; that is, chlorine which is liberated by acid.

In Silesia and Bohemia, where the chlorine process is not adopted, the linens are exposed to a fermenting process, then washed, and steeped in alkaline liquors, with alternate exposures upon grass, which processes are repeated a great number of times for 60 to 70 days; but to render them properly white, they are afterward passed through a bath acidulated with sulphuric acid, then treated again with the potash lye several times and alternately exposed on the grass, and finally thoroughly cleansed by washing in a revolving cylinder called a dash-wheel. This machine is also employed in the English and Scotch processes for washing the goods without subjecting them to unnecessary wear. The frequent repetition of the different processes is rendered necessary by the complete diffusion of the coloring matters through the flax fibres, and their close union with them; each operation decomposing and removing in succession small portions only.

In the bleaching of cotton cloth, the pieces, after being singed, by passing them over a red-hot plate or a semi-cylinder of iron or copper, are steeped in lukewarm water or old lyes, till they are completely soaked, which loosens any paste or filth got during weaving; they are then well washed through the dash-wheel, and put through the hydro-extractor or drying machine. If the cotton is in the hank, this process of steeping and washing is not required.

The mechanical operations of the bleaching house vary considerably, according to the quality of the goods and the facility for mechanical appliances. In the chemical operations of whitening the cloth there is little variation, further than that heavy fabrics require longer time and more frequent repetition of the processes. The first operation, after steeping and washing, is boiling. The boiling liquor is made by adding a quantity of water to slaked lime, and when the grosser particles of lime have settled to the bottom of the vessel, the milky liquor is put into the boiler, or, it may be, filtered through a cloth. Some bleachers use with the lime a little carbonate of soda; the quantity of lime varies from four pounds to eight pounds for every 100 pounds of cotton, and from one pound to two pounds of soda ash, where this is used. The boilers used for boiling the goods are called *kiers*, and many kinds are used, the boiling liquid being made to shower over the goods and percolate down through them. This is effected by having a false bottom or frame fitted inside the boiler at about one third of its depth from the bottom, upon which the goods are laid. The space between the false bottom

BLEACHING

and real bottom of the boiler is filled with the liquor or lye, connected with which is a pipe leading to the top of the boiler. When the heat is applied, either by steam or fire, and the liquor begins to boil, it is forced up through this pipe, which is made to shower its contents over the surface of the goods. This boiling is continued, according to the quality of the goods, from 6 to 12 hours. The goods are now removed from the boiler and washed in water; they are then passed through dilute hydrochloric acid, again washed, and boiled for 12 hours with dilute caustic soda, after which they are passed into a solution of bleaching powder contained in a large stone or wooden trough or cistern, where they are left for from two to four hours. The bleaching solution is prepared by first dissolving a quantity of bleaching powder in water in a large cask and allowing the whole to settle; a quantity of the clear liquor is then drawn from the cask and put into the large bleaching cisterns, which have been previously nearly filled with water. To ascertain the necessary quantity of this strong bleaching liquor to be added to the troughs or cisterns, a certain measure of sulphate of indigo is taken in a graduated vessel, termed a test glass, and then, according to the number of graduated measures of the bleaching solution required to decolor the sulphate of indigo, the strength of the bleaching liquor is regulated. These test glasses and sulphate of indigo are carefully prepared for the purpose.

Instead of dash wheels, a more improved method of cleaning and washing is adopted by some bleachers previous to boiling the goods. They are all sewed together, end to end, making one line of the whole. This line of pieces is drawn along by machinery between rollers and squeezers, with a plentiful supply of water, and having been thus thoroughly washed and cleaned, is at last laid out by a mechanical contrivance into the bleaching trough. The goods are allowed to steep in the bleaching liquor from two to four hours; they are then lifted and washed, either by the dash wheel or rollers, as before, and are then laid in a sour, made by adding about one pint of hydrochloric or sulphuric acid to every four gallons of water. After steeping in the sour for four hours, the goods are again washed, as before, and are subjected to another boiling for eight hours; but this time the lye is caustic soda or potash, generally the former, made caustic by boiling together a quantity of soda ash and slaked lime, and allowing the sediment to settle, and using only the clear solution. About eight pounds of soda ash suffice for 100 pounds of goods. After the boiling the goods are again washed and steeped in the bleaching liquor for eight hours, and again washed and soured—the sour in this case being always made with sulphuric acid. Light fabrics require no further treatment; but heavy fabrics need a clearing process, which is a repetition of the last course, the liquors being generally, however, a little weaker, and the processes shorter. Cotton, in the hank, undergoes the same operation, except in the washings, which are performed by hand, not with the wheel. The goods being bleached and dried by the extractor, are now prepared for the operations of finishing. For this purpose they are stretched by women to their breadth, and the folds, as much as possible, taken out by beating them; then they are stitched together by the

ends with a sailor's needle, and being thus prepared for the mangle the cloth is now starched, common wheat flour and a portion of porcelain clay being employed. It is then subjected to the action of the stiffening machine, and having been thus impregnated with starch, the superfluous portion of which is pressed out as it passes through the rollers above, the goods are then hung upon rails in an apartment, called the stove, heated by two furnaces from which flues are led through the room. The heat thus generated is sometimes so great that the workmen, in hanging up the cloth, are obliged to throw off most of their clothes. When the goods are dried thoroughly, they are taken from the stove and carried to the damping machine, where they are subjected to the action of a shower of water. When the cloth comes from the damping machine, it may be seen covered with wet spots, the greater portion, however, being dry; but after remaining some time it becomes uniformly damp. The goods are now passed through the calender; they are then regularly folded and put into a Bramah press, with a sheet of pasteboard between each, and, being sufficiently pressed, they are then finished for the market. The process has been greatly shortened by the introduction of the Mather-Thompson process (1884). In this process an important feature is the use of the steamer kier, in which the goods are submitted to the action of low-pressure steam. The material is passed through soda lye, squeezed, and washed; then through boiling caustic soda, squeezed, and run into a steamer kier, where it is boiled for four hours under a pressure of four pounds, washed with hot water, and then passed continuously through a series of vats containing water, bleaching powder solution, carbonic acid gas, water, alkaline solution, water, bleaching powder, carbonic acid gas, water, hydrochloric acid.

The bleaching of linen is conducted after a similar manner to that of cotton; but there is much more coloring matter in the former than in the latter, and it is therefore found necessary in the bleaching of linen to repeat the boiling in lye and the steeping in chloride of lime three or four times. An electrolytic method of bleaching (the Hermite process) has recently been introduced. The chlorine for bleaching is liberated by the action of an electric current on solutions of calcium or magnesium chloride. Wool and silk cannot be bleached with chlorine, so sulphur dioxide, usually prepared by burning sulphur, is used instead. In the case of wool, the material is well washed with water and scoured with alkaline solutions to remove fatty matters. It is then exposed, while still wet, to the action of sulphur dioxide in a brick chamber for six or eight hours,—or it may be soaked for several hours in a solution of sulphurous acid,—after which it is well washed. Silk is treated with dilute acid, then worked in a soap bath for about 20 minutes to remove the gummy matter present, after which it is rinsed, tied up in bags of cotton, and boiled for from one to three hours in water, and rinsed in dilute alkali and finally in water. The bleaching is effected by stoving in sulphur dioxide, exactly as in the case of wool. In place of sulphur dioxide, hydrogen peroxide is coming into use for both wool and silk bleaching.

BLEACHING POWDER—BLEEDING

Bleaching Powder, a compound of lime, chlorine, and oxygen, greatly used for bleaching purposes, and as a disinfectant. It is commonly known also as "chloride of lime," a name somewhat unfortunately chosen, since it appears to imply that the substance is simple chloride of the element calcium, which is far from being the case. Its precise chemical nature has never been satisfactorily demonstrated, but it is believed to consist essentially of a mixture of calcium chloride and calcium hypochlorite. In preparing bleaching powder on a commercial scale, slaked lime is spread out, in a thin layer, on the floor of a chamber constructed of stone, or lined with lead. Chlorine gas is then admitted to the chamber, and allowed to act upon the lime until the latter has absorbed considerable of it, and has been superficially transformed into the substance desired. The lime on the floor is then thoroughly raked over, so as to expose a fresh surface to the chlorine, and the process is continued until samples of the powder, withdrawn for the purpose of analysis, are found to contain about 37 per cent of available chlorine. The lime used in the process should be as free from magnesia as possible, as otherwise more or less of the chlorine is wasted by the formation of undesirable compounds of chlorine and magnesium. The chlorine used in the manufacture of bleaching powder has been largely produced, in the past by heating manganese dioxid with the hydrochloric acid obtained as a by-product in the manufacture of soda from common salt. The tendency in recent times, however, has been toward the more direct manufacture of soda by the electrolysis of a solution of salt in water. Free chlorine gas is given off at the anode during this electrolytic process, and this is now largely utilized for the manufacture of bleaching powder; bleaching powder and soda being both produced in the same factory. Large works embodying this idea are in operation at Niagara Falls, and most of the soda and bleaching powders manufactured in the United States now come from that place. Bleaching powder is white, or nearly so, and has a strong smell of chlorine. Its disinfecting properties are supposed to be due to the slow liberation of that gas, which is a powerful germicide.

Bleak, or **Blick** (*Leuciscus alburnus*), a small river fish, six or seven inches long, of the carp family. It somewhat resembles the dace. Its back is greenish, otherwise it is of a silvery color, and its silvery scales are used in the manufacture of artificial pearls. It is a good food fish.

Bleak House, a novel by Charles Dickens (1853). Its secondary theme is the monstrous injustice and even ruin often wrought by delays in the old Court of Chancery, which defeated all the purposes of a court of justice.

Blechen, **Karl Eduard**, kārĭl ɛd'oo-ard bhĕn'ɛn, German landscape artist: b. Kottbus, 1798; d. 1840. After studying art in Italy for some years he settled in Berlin in 1830 and became professor at the Academy of Fine Arts there in 1835. The first representative of the Berlin landscape school, he painted 'Villa Este'; 'Villa Borghese'; 'View Near Nami'; 'View of Naples'; 'View at Tivoli'; etc.

Bled'soe, **Albert Taylor**, American clergyman and writer: b. Frankfort, Ky., 9 Nov. 1809; d. Alexandria, Va., 1 Dec. 1877. He was assistant secretary of war of the Southern Confederacy, and successively an Episcopal and a Methodist minister. He was also professor of mathematics at Kenyon College and at Miami University, 1833-6. Besides editing the 'Southern Review' and contributing frequently to leading literary, scientific, and theological periodicals, he wrote 'Examination of Edwards on the Will' (1845); 'Theodicy' (new ed. 1853); 'Philosophy of Mathematics' (1868); etc.

Bleecker, **Ann Eliza**, American poet, daughter of Brandt Schuyler: b. New York, Oct. 1752; d. Tomhanick, near Albany, N. Y., 23 Nov. 1783. She married, in 1769, John J. Bleecker, and moved to Tomhanick, whence she was driven by the news of the approach of Burgoyne's army. Her husband had already left to provide means of escape, when she was obliged to fly on foot, in the midst of her family, and of a crowd of other helpless persons, for refuge from the advancing savages. After enduring great horrors and distresses, they made their escape to Albany, and thence by water to Red Hook, where they remained until the surrender of Burgoyne enabled them to return to their home. Her poems were written as suggested by occasions, without a view to publication. She possessed a sportive fancy, with much tenderness of feeling, but the sad experiences of her life produced upon her such an effect, that she destroyed "all the pieces that were not as melancholy as herself." Her poems are to be found in the earlier numbers of the 'New York Magazine,' and a collection of her stories and "poetics" in a volume published in 1793, by her daughter Margaretta.

Bleeding, the escape of blood from the arteries or veins. Bleeding may be external, and thus readily seen and prevented by proper surgical measures, or it may take place internally, into one of the large body cavities, and is then a serious matter. The amount of blood that is in the human body varies from one tenth to one twelfth of the weight of the individual, and of this from 40 to 60 per cent may be lost without resulting in death from the direct effects of bleeding. Death may result in some individuals from the loss of much smaller quantities, but most persons can lose two fifths of their blood and not die. Bleeding varies widely in its rapidity. Some wounds ooze, others well-up, and again bleeding may be very rapid when a large vessel has been cut.

Bleeding from a vein or an artery may be recognized by the dark color and regular flow from the former, and the brighter red and spurting or throbbing flow from the latter. If bleeding is taking place while pressure is being applied to a cut these differences may not be so pronounced. In emergencies bleeding from an artery may be stopped by direct and hard pressure of the carefully cleaned finger immediately over the source of the issuing jet of blood. This pressure must be hard and continued. This will permit time to find the chief artery that is supplying the bleeding vessel, and as soon as this is found pressure upon it will further aid in suppressing the flow. Thus the brachial artery can be found on the inside of the arm by feeling on the patient's well side, and firm pres-

sure on it will stop all bleeding in the parts below, as in a cut wrist or cut hand. Pressure on the femoral artery in the groin will control all bleeding below the point of pressure. As pressure by means of the finger is difficult to maintain, an improvised apparatus may be made of a knotted napkin or large handkerchief. This may be placed about the arm or leg, the knot brought to press on the artery and then by means of a short stick the whole may be made to tightly compress the entire limb. (See *TOURNIQUET*). Pressure of this kind should not be too prolonged, or serious damage to the parts may result. Venous bleeding is usually controlled by direct pressure of the limb on the side away from the heart and by direct pressure of antiseptic gauze. In oozing, direct pressure of antiseptic gauze or direct application of hot water, 118-120° F., is most effective. Powders, cobwebs, iron, alum, etc., are not advisedly used.

Internal hemorrhage is extremely important, since the blood cannot be seen, and one has to rely on the symptoms solely. These are usually a beginning sense of faintness or weakness, and perhaps some nausea. The extremities commence to get cold and white, the face becomes pale and anxious, and the patient may commence to have air-hunger. He desires the windows to be opened wide, thinking thereby to get more air. Thus the beginning symptoms are very similar to those of a severe fainting spell. But as the bleeding continues there is increasing restlessness with increased air-hunger; there may be cold, clammy sweat over the patient's body; there is sighing to gasping respiration, and the heart-beat is hard to hear and it may be impossible to feel the pulse beat. The patient may die in convulsions, the face becoming deeply cyanosed, and the respirations spasmodic or convulsive in type. If the patient does not die he will have a long, tedious convalescence. Prompt medical or surgical aid is imperative in all such cases. The best temporary stimulant is an enema of hot (118-120° F.) salt solution, one teaspoonful to the pint, which is allowed to run in and out of the rectum, a quart or two at a time.

Bloodletting.—This procedure was one much in vogue in former years, and while still a most desirable operation to perform for certain types of disease, the conditions brought about by its use are now largely induced by other means. In conditions of poisoning, some cases of pneumonia, and in some apoplexies, bleeding is still performed by competent medical practitioners, and is advocated in most manuals of practice. It is its indiscriminate use for all ills that has fallen out of favor.

Bleeders.—Certain individuals have a tendency to bleed inordinately from even the slightest wound. They are called "bleeders," and are frequently found in families, most of the members of which have like traits. The pulling of a tooth is often followed by continuous hemorrhage. The causes for this idiosyncrasy are not all known. In some an insufficient quantity of calcium salts in the blood has been thought to be the most important cause.

Bleeding Heart. See *DICENTRA*.

Bleeding Heart Yard, a squalid locality in London, mentioned by Dickens in 'Little Dorrit.' The origin of the name is unknown.

Bleek, Friedrich, frēd'rīh blāk, German biblical scholar and critic: b. Arensbök, Holstein, 4 July 1793; d. 27 Feb. 1859. He was appointed professor of theology at Bonn, 1829, and spent the remainder of his life there. He was the author of much esteemed commentaries and expository books, valuable Introductions to the Old and New Testaments (1860-2), his most important work being one on the 'Epistle to the Hebrews' (1828-40).

Bleek, Wilhelm Heinrich Immanuel, vil'hēlm hīn'rīh īm-mān'oo-ēl, German philologist, son of Friedrich Bleek (q.v.): b. Berlin, 8 March 1827; d. Cape Town, 17 Aug. 1875. In 1855 he went to South Africa and devoted himself to the study of the language, manners, and customs of the natives. In 1860 he was appointed public librarian at Cape Town, and his researches were rewarded with a pension from the civil list. He was principal author of the 'Handbook of African, Australian, and Polynesian Philology' (1858-63), his other chief productions being 'Vocabulary of the Mozambique Languages' (1856); 'Comparative Grammar of South African Languages' (1862); 'Hottentot Fables and Tales' (1864); and 'The Origin of Language' (1868).

Bleibtreu, Georg, gā-ōrīh blīp'troi, German artist: b. Xanten, Rhenish Russia, 27 March 1828; d. Berlin, 16 Oct. 1892. His first important picture was the 'Destruction of the Kiel Turner-Corps at Flensburg' (1852) and his subsequent works are also battle pieces. Among them are 'Episode from the Battle of Waterloo' (1858); 'Battle of Königgratz'; 'Surrender of Napoleon after Sedan'; 'Attack of Saxon Corps at Saint Privat' (1880).

Bleibtreu, Karl August, kārīl ow'goost blīp'troi, German poet and novelist: b. Berlin, 13 Jan. 1859. He is one of the foremost representatives of the youngest German school in literature, and a pronounced realist. All his views are radical, as shown by the very titles of his works; for example, 'Revolution in Literature' (1885); 'Literature's Struggle for Life.' He also wrote 'Dies Iræ'; 'Napoleon at Leipzig'; 'Cromwell at Marston Moor.' His dramas are: 'Lord Byron' (1888); 'The Day of Judgment'; 'The Queen's Necklace'; etc.

Bleichröder's, blīh'rē-dēr-z, a celebrated banking house in Berlin, established by Samuel Bleichröder, who died in 1855, continued by his son, Gerson Bleichröder, who died in 1893, and subsequently by the two sons of the latter. Under the patronage of Bismarck it entered into commercial relations with the Prussian government, rendering material assistance in 1866 and again in 1871. Gerson Bleichröder was raised to the hereditary peerage in 1872.

Blemmyes, blēm'yē-z, or **Blemyes**, a people of ancient Ethiopia, who for several centuries after Christ gave much trouble to the Romans during their occupation of northern Africa. Their influence extended to a period as late as the 7th century.

Blende (German, "to blind," in allusion to the fact that the mineral is easily mistaken for galena, and yet yields no lead). A native sulphide of zinc, having the formula ZnS, and known also as sphalerite. It crystallizes in tetrahedral forms belonging to the isometric

BLenheim — BLenheim HOUSE

system, and has a very perfect cleavage. It is commonly brown, black, or yellow, but may have other colors also, and may be nearly colorless when pure. Its hardness is from 3.5 to 4, and its specific gravity is about 4.00. It usually occurs massive, with dodecahedral cleavage, and is found commonly in connection with galena, and also in deposits of considerable extent in cavities in limestone. It is a valuable ore of zinc, and is mined near Joplin, Mo., in Cornwall (England), and in various parts of the United States, notably in Kansas, Illinois, and Colorado. The miners of Cornwall call it "mock lead" and "black-jack."

Blenheim, blēn'īm, or **Blindheim**, a Bavarian village about 23 miles from Augsburg, the theatre of a great battle, fought 13 Aug. 1704 (also called the battle of Höchstädt, from another village of this name in the vicinity), in which Marlborough and Prince Eugene, commanding the allied forces of England and the German empire, gained a brilliant victory over the French and Bavarians. The latter armies were drawn into the engagement under the most unfavorable circumstances. Both these armies amounted to 56,000 men, while the forces of Marlborough and Eugene were about 52,000. The first had thrown their troops chiefly into the two villages of Blenheim and Kinzingen, which they considered as points of support for their wings, though at too great a distance in front of their main position. A large proportion of cavalry was in the centre, since each army, the Bavarian as well as the French, had their horse on their wings, and in this way those of two wings must necessarily join each other. Both the commanders would undoubtedly have perceived and corrected this mistake, as Tallard, the French general, had in Blenheim alone 27 battalions of infantry; but they expected so little to be attacked, that when the line of the allies began to move, 13 August, at two o'clock in the morning, they supposed them to be marching off. The greatest part of their cavalry was sent to forage. Even at seven o'clock, when the heads of the eight columns with which Eugene and Marlborough advanced toward the Nebelbach were to be seen, Tallard thought the whole a stratagem intended to cover the retreat; but he soon saw his error. The dispersed troops were recalled in the greatest hurry, and the cannon were drawn up in line. The French and Bavarians made every exertion to prevent the passage of the enemy over the small stream of Nebelbach, and the capture of the two villages, the conquest of which was considered by Marlborough and Eugene as decisive. Their line of attack was uncommonly long, about four and a half miles. Marlborough, in order to secure his right wing, attacked Blenheim, but without success; he then changed his plan, and threw himself with his principal forces into the wide interval between the right wing and the centre of the enemy, leaving only as many troops before Blenheim as were necessary to check the body which occupied this position. At five o'clock in the afternoon he succeeded, after great efforts, in passing the Nebelbach, by which his victory was decided. Tallard himself was among the pris-

oners; his son was killed. The consequences of the battle were decisive. Bavaria, as Marlborough had anticipated, fell into the power of Austria.

Blenheim Dog. See **TERRIERS**.

Blenheim House, the name of the seat of the Duke of Marlborough, in the parish of Woodstock, and county of Oxford. The estate having been given by Queen Anne to Marlborough for his eminent services, Parliament granted the sum of half a million sterling to erect a suitable family seat. The building was intrusted to Sir John Vanbrugh, and called Blenheim, from the village where the Duke gained his great victory. In this park once stood the royal palace of Woodstock, where Alfred is said to have resided, and which was the favorite residence of Henry II., who erected a house in the park for his favorite mistress, Rosamond Clifford, whence the well-known legend of Woodstock-bower, Queen Eleanor, and the Fair Rosamond. Edward III. was also much attached to this palace, in which his eldest son, the illustrious Black Prince, was born, as well as his youngest son, Thomas, Duke of Gloucester, usually called Thomas of Woodstock, from that event. Richard II. likewise kept his court here, at which time the poet Chaucer resided at Woodstock, in a house which stood near the present entrance to the park. During the civil wars of the 17th century it was for some time defended for the king; but it ultimately surrendered, and was much injured and dilapidated by the parliamentarians. The usual approach to Blenheim from Woodstock is through a triumphal arch or portal. In front of the building stands a sculptured column 130 feet high, surmounted by a statue of the duke, whose victories and achievements are recorded on tablets round the base. The front of the house measures 348 feet from wing to wing, and although architectural critics find many faults in detail, the general effect is in the highest degree noble and commanding. The interior is extremely magnificent; the hall, supported by Corinthian pillars, is 67 feet high; and the ceiling was painted by Sir James Thornhill, the design representing Victory crowning the Duke. The gallery and bow-window room abound in portraits by the most eminent masters, both foreign and English. On the tapestry of the latter are figured the various battles gained by the same great general, and more especially that of Blenheim. The saloon, a noble and spacious apartment, communicates with the hall, and occupies the entire breadth of the centre. The lower part is lined with marble, and six of its compartments are decorated with pictures by La Guerre, representing the inhabitants of the different nations of the world in appropriate costume. On the ceiling is a representation by the same artist, of the victorious Duke arrested in his career by Peace and Time. The remaining principal subjects of admiration are the library, theatre, state drawing-room, blue and green drawing-room, grand cabinet, the dining-room, etc. In the chapel, which forms one of the wings, is a fine marble monument by Rysbrack, to the great Duke and his almost equally celebrated duchess, Sarah. The gardens and grounds,

which are exceedingly spacious, were laid out by Brown, who contrived to make a most admirable use of the small river Glyme in the formation of a lake, or piece of water, which is justly deemed one of the greatest beauties of the place. It is crossed by several arches, and at the middle or grand approach is a magnificent bridge, the span of the centre arch of which is 101 feet.

Blenker, blenk'ër, Louis, German-American soldier: b. Worms, Germany, 1812; d. 16 Oct. 1863. He took an active part in the revolutionary movement of 1848 in Germany and was forced to leave his native land, emigrating to the United States. He organized the 8th regiment of New York Volunteers at the outbreak of the Civil War, and was its colonel. He was promoted to the rank of brigadier-general at the first battle of Bull Run, and engaged in the battle of Cedar Keys in 1862. He died of wounds received while at Warrenton, Va.

Blennerhas'sett, Harman, English emigrant in America: b. Hampshire, England, 8 Oct. 1764; d. on the island of Guernsey, 2 Feb. 1831. He sprang from a wealthy and highly connected house which traced its ancestry back to Edward III.; was educated at Westminster School, London, and Trinity College, Dublin, graduating 1790. The youngest of three sons, he studied for the law, but the death of his brothers soon after made him head of the family. Early in 1796 he privately married his sister's daughter, Margaret Agnew, a beautiful and highly accomplished girl of 18, also of excellent family, her father having been lieutenant-governor of the Isle of Man, and her grandfather an English officer killed at Germantown. This incestuous union brought its ultimate punishment from nature in a family of physical and moral wrecks; but a more immediate one was entire social ostracism, which soon drove him to break his entail and sell his estates, except some reserved incomes, and come to America with his wife and a library and philosophical apparatus. Arriving 1 Aug. 1796, he finally, in 1798, settled on a small island in the Ohio River a few miles below Parkersburg, W. Va., and spent \$60,000 on a house and grounds, pictures, and statuary. This was for years the show place of America west of the Alleghanies, and drew a stream of notable guests, whom he entertained with elaborate hospitality. Here he read, made music, which was his chief passion, and dabbled in feeble absent-minded scientific experiments. In 1805 Aaron Burr (q.v.) was one of his guests, and then or next year induced him to join in the scheme for a southwestern empire, to include Mexico; Blennerhassett was to be prime minister and a duke, and perhaps ambassador to England. He was a timid, dreaming, futile, unadventurous man, but, like many such, may have fancied himself a great statesman and hero *in posse*. He may, perhaps, have consented because Mexico was farther from Great Britain than the Ohio, and the canker of his life was fear lest chance should disclose his secret to his friends and children. His wife, much the stronger nature of the two, was certainly ambitious for him, and he would not have embarked in such a

venture without her approval. Anyway, he advocated Burr's "colonization" plan in the papers, and invested a great sum in arms, ammunition, provisions, boats, etc., on the faith of obligations from Burr's son-in-law Allston, which were largely defaulted. The scheme fell through; Blennerhassett was twice arrested, imprisoned and tried for treason, but discharged in 1807 on the acquittal of Burr. His place, however, had been wantonly injured by the militia, and was seized by his creditors and turned into a hemp field. The mansion was converted into a granary and was finally burned by accident. Blennerhassett now settled in Natchez, and soon after bought a 1,000-acre cotton plantation on the Mississippi, a few miles above Port Gibson, which he called La Cache. It was unsuccessful, and the War of 1812 injured his commercial speculations; and in 1819 he sold it for \$28,000 and removed to Montreal, practising law in hope of obtaining a judgeship through his old schoolmate, the Duke of Richmond. This failing, he returned to England in 1822 in hope of winning back his property by a reversionary action, and then of obtaining employment through an influence which no longer existed. In 1824 he came back after his family. Everything failed him, though he and his wife were decently treated; at last his health gave way, and he died at Port St. Pierre on the island of Guernsey. He was generous with his money while he had it, and helped out of financial difficulties several of the musicians he consorted with. His wife, though disinherited, had always had an income paid her by her sisters; and in 1838 received a property by the will of her husband's maiden aunt. In 1840 she came to the United States to push a claim before Congress for the island property, and indemnity for the ravages of the militia. Henry Clay favored it, and its passage was probable; but before it came up she died in New York, 16 June 1842. The story of her being left penniless with a dependent family (the youngest was 19 at his father's death), and of her dying in poverty and being buried by sisters of charity, are fictions. She had some literary ambitions, and while in Montreal wrote two volumes of verse, 'The Deserted Isle' (1822), and 'The Widow of the Rock, and Other Poems' (1824).

Bibliography.—Therèse Blennerhassett-Adams, 'The True Story of Harman Blennerhassett,' in the 'Century' (Vol. 62 1901); 'The Blennerhassett Papers' (1864); Safford, 'Life of Blennerhassett' (1835); Pidgin, 'Blennerhassett,' a romance (1902).

Blenny. These small fishes of the spiny-rayed marine family *Blennida*, frequent rocky coasts and shallows, in seas of all parts of the world. Their elongated bodies, some of which are scaleless, are remarkable for the abundance of slimy matter with which they are covered. These fishes are extraordinary in possessing but one dorsal fin, which in some species is deeply divided; and in having the faculty of using their ventral fins to aid them in moving about among the rocks and sea-weed. They are frequently deprived of water, by the ebb of the tide, when they are capable of subsisting for some hours. Small

crustaceans form their main food. In some species the eggs are retained in the oviduct until they hatch, so that the young are produced alive.

Blénorrhœa, an old term signifying a muco-purulent discharge from any mucous membrane. This discharge is usually creamy white and consists usually of water, mucus, epithelial cells, white blood cells, or pus cells, and bacteria. At the present time a blénorrhagic discharge is definitely named according to the structure involved. Thus a blénorrhœa of the eyes is termed a purulent conjunctivitis; of the vagina, leucorrhœa; of the urethra, gleet or urethritis; if a urethritis of infectious origin, gonorrhœa, etc. Treatment is usually local and general. Tonic stimulating applications may be locally applied, and the general health built up as thoroughly as possible.

Blepharitis, an inflammation of the margin of the eye-lids and hair follicles. It may consist of a very slight hyperæmia or redness that causes itching and discomfort. This form may be due almost entirely to eye-strain and proper glasses will usually cure it. The disease may be more extensive, involving the margin and the follicles, with redness and swelling and whitish scales. The eyelashes may drop out, but usually are regrown, and there is much itching and discomfort. This form may also result from refractive errors, or may be the index of a bad constitutional state from poor food, bad surroundings, or it may follow the infectious diseases, notably measles. A more persistent form is associated with ulceration and loss of the eyelashes. This is usually a very chronic type and resistant to treatment. In the management of all forms, all errors of refraction should be corrected by properly adjusted glasses,—not on opticians' prescriptions,—and the local treatment by stimulating ointments.

Bléré, blâ-râ, a French town, in the department of Indre-et-Loire, on the Cher, 15 miles east-southeast of Tours. It contains a notably fine 16th century chapel. Pop. (1896) 3,269. In the vicinity is the Château Chénouaux, built in the time of Francis I., and still in excellent preservation. It was given by Henry II. to his mistress, Diana de Poitiers, who was dispossessed on the death of Henry by Catherine de Medici. In the latter part of the 18th century it was frequented by Fontenelle, Voltaire, Rousseau, and all the wits of the time, who were drawn together by the then owner of the château, Madame Dupin, widow of a *fermier-général* who died in 1799. See Cook, 'Old Touraine.'

Bles. Henri, ðñ-rê' blēs, Flemish painter: b. probably at Dinant, about 1480; d. 1550. Very little is known of his career, and the 'Adoration of the Magi' in the Dresden Gallery is his only signed picture. He is known to have been a very prolific artist, and almost all the European galleries contain paintings ascribed to him.

Blesbok, blēs'bök, one of the African hartbeests, now rare, which was distinguished by the violet color of its coat. See HARTBEEST.

Blessing, or **Benediction**. The expression of wishing one well soon gave rise, in early ages, to a solemn act, accompanied, like other solemnities of those periods, by symbolic signs; this was the blessing or benediction. In patriarchal times, when the authority of the head of a family included that of the priest and the civil ruler, the blessing of course appertained chiefly to him, on account of his venerable character, and when the priests began to form a separate class, became, in certain cases, a prerogative of theirs. As the authority of the father, in the infancy of every nation, is extremely great, the idea soon sprung up that his prayers, invoking the favor of the Deity, were more effectual than those of others, and that whatever he blessed would be likely to receive the favor of God. The same importance was soon attributed to blessings conferred by a priest. The heathens, the Jews, and many Christian sects, have cherished this idea. By the Jewish institutions, certain benedictions were reserved to the priest; the same is the case in the Roman Catholic Church, in which different benedictions are appropriated to different degrees of the clergy. We shall mention only a few of them. The Roman Catholic bishops alone can confer those benedictions which are connected with unction, and are called consecrations, as, for instance, the consecration of kings and queens, of the cup and *patera*, the church and altar. To them also is confined the benediction of abbots and abbesses, of knights, and the holy oil. For the benediction of the holy vestments, etc., they may employ a substitute. Every Roman Catholic clergyman may confer the benediction on the occasion of betrothment; also the marriage benediction; may bless the fruits of the earth, and the holy water. The benediction of a bishop is eagerly sought for by a faithful Roman Catholic, as contributing peculiarly to his spiritual welfare; and the Catholic clergy, in general, use the benediction as a salutation or reward for a service, etc. When the Pope rides or walks out the Roman Catholics kneel to receive his blessing, which he gives by a motion of his hand. In his ante-chamber are often seen things of different kinds, rosaries, etc., in large quantities, which he blesses in passing by. The Roman Catholic Church blesses things animate and inanimate, and this is believed by many to preserve them from sickness, injury, etc. Among most Protestant bodies there is a blessing pronounced upon the people at the close of a religious service, that of the Church of England being contained in the Prayer Book. Roman Catholics in many cases use the consecrated water in giving the benediction.

Blessington, Margaret (COUNTESS OF): b. Knockbrit, near Clonmel, Ireland, 1 Sept. 1789; d. Paris, 4 June 1849. She was the daughter of Edmund Power, and at the age of 15 was married to a Capt. Farmer, who died in 1817. A few months after his death she married Charles John Gardiner, Earl of Blessington. In 1822 they went abroad together, and continued to reside on the Continent till the Earl's death in Paris, in 1829, when Lady Blessington returned to London and took up her abode in Gore House, Kensington, which had been bequeathed to her by her husband. Here for many years she held those celebrated reunions and soirees, at which the most distinguished literary characters in London were wont to assemble. The

fascination of her manners and conversation, with her genial warm-heartedness of character, rendered these gatherings most attractive; but certain equivocal circumstances in relation to her connection with a Count d'Orsay prevented their being frequented much by respectable female society. The count had married a daughter of Lord Blessington by his first wife, and been separated from her shortly afterward, but after the death of his father-in-law, resided with the countess during the remainder of her life. Lady Blessington had made her debut as an authoress in 1822 by the publication of two volumes of 'Sketches.' In 1832 she contributed to the 'New Monthly Magazine,' 'Conversations with Lord Byron,' considered by many as the best of her productions. She also wrote numerous novels, including, among others, 'The Belle of a Season'; 'The Two Friends'; 'Strathern'; and 'The Victims of Society.' None of these have much literary merit, but describe scenes in fashionable life with considerable power, and enjoyed at the time a large share of popularity. She acted as editress for several years of 'Heath's Book of Beauty' and the 'Keepsake,' and also of another annual, the 'Gems of Beauty.' In 1849 she proceeded to Paris, whither Count d'Orsay had previously gone, in the hope of obtaining an appointment under Louis Napoleon, with whom they had been intimate during his exile in England. Consult Madden, 'Life of the Countess of Blessington' (1855).

Blicher, Steen Steensen, stān stān'sēn blīh'ēr, Danish poet and novelist: b. Vium, Jutland, 11 Oct. 1782; d. Spentrup, 26 March 1848. His first work was a translation of 'Osian' (2 vols. 1807-9), and his first original poems appeared in 1814, but attracted little notice. He quickly won a national reputation with his novels, and in 1842 appeared his masterpiece of novel writing, 'The Knitting Room,' a collection of short stories in the Jutland dialect.

Blida, blē-dā', a fortified town of Algeria, 30 miles inland from Algiers, well-built, with modern houses and public edifices, the centre of a flourishing district, and having a good trade. There are cedar and cork trees in the neighborhood and mines of copper and lead. The principal exports are oranges, grain, tobacco, raisins, etc. It is one of the chief stations on the railway connecting Oran, Algiers, and Constantine. Pop. (1896) 13,026.

Bligh, William, English navigator: b. Plymouth, England, 9 Sept. 1754; d. 7 Dec. 1817. He acquired considerable celebrity from having been the commander of the ship *Bounty* when the crew mutinied in the South Seas and carried her off. She had been fitted out for the purpose of procuring plants of the bread-fruit tree, and introducing these into the West Indies. Bligh, who had sailed with Capt. Cook, obtained the command, and in December 1787, left Spithead for Otaheite, where he arrived, and remained till April 1789. Having loaded his vessel with plants he set sail and was proceeding on his voyage for Jamaica when he was seized in bed, bound, and brought on deck. The launch was lowered, and Bligh, with 18 men supposed to be well disposed to him, were forced into it, with no other provision than 150 pounds of bread, 32 pounds of pork, a little

rum and wine, and 28 gallons of water. Thus scantily provided they found themselves in the open sea, not far from the island of Tofoa, in lat. 19° S. and lon. 184° E., and managed by admirable skill and perseverance, though not without enduring fearful hardships, to reach the island of Timor in 41 days, after running nearly 4,000 miles without the loss of a single man. Ultimately 12 of the number reached England. Of these, Bligh was one, and in a second voyage accomplished the object of the first by giving the bread-fruit tree to the West India Islands. When several of the mutineers were afterward tried at Portsmouth, sufficient evidence was obtained to show that Bligh himself was not free from blame, and had on many occasions been too much inclined to play the tyrant. This feature in his character was afterward manifested on a larger scale. In 1805 he was appointed governor of New South Wales, and acted so harshly that the other authorities interfered and put him in confinement. On his return he was made an admiral. See PITCAIRN ISLAND.

Blighia, blī'ī-ā, a genus of numerous trees and shrubs of the natural order *Sapindaceæ*, the principal species of which is *B. saoida* (*Cuoania saoida* of some botanists), the akee tree indigenous to west tropical Africa and naturalized in the West Indies since the close of the 17th century. It is also planted in southern Florida. The tree attains a height of 30 feet, bears pinnate ash-like leaves and very fragrant whitish flowers, from which by crude distillation the colored people obtain a cosmetic and which would probably yield a valuable perfume under proper management. The rich, red fruits, as large as goose eggs, are used for dessert and largely also in cookery. In Jamaica the tree is cultivated as high as 3,000 feet above sea-level, although it can withstand slight frosts. *Cuoania anacardioides*, which also bears an edible fruit, has been introduced into California, and *C. elegantissima* is sometimes raised in warm greenhouses for its attractive foliage and racemes of white flowers.

Blight, an indefinite term applied to any diseased state of cultivated plants, but gradually being restricted to plant diseases caused either by bacteria or fungi. See sections on diseases in articles on various plants.

Blight, American, an English and Australian name for the woolly apple louse or "apple blight," one of the aphides (q.v.).

Blight-bird, a small insectivorous bird (*Zosterops caeruleus*) of New Zealand, which devours the "blight" or plant-lice on fruit trees. It is one of the white-eyes (q.v.).

Blimbing, Bilimbi, Cucumber-tree (*Averrhoa bilimbi*), a tropical tree of the natural order *Geraniaceæ*, native of southern Asia, where it is largely cultivated and whence it has been introduced in other tropical countries. It is extensively raised in South America. The tree attains a height of 15 feet, bears racemes of red flowers followed by smooth cucumber-shaped green fruits as large as hen's eggs, which are highly esteemed for their acid pulp. The carambola (q.v.) is a close relative.

Blind, blint, Karl, German political agitator and writer on history, mythology, and Germanic literature: b. Mannheim, 4 Sept. 1826.

He was educated at Heidelberg and Bonn, and from his student days till he settled in England in 1852 he was continually engaged in agitating or in heading risings in the cause of German freedom and union, being frequently imprisoned. The democratic propaganda has since been supported by his pen; and he has written political and biographical works: 'Fire-burial Among Our Germanic Forefathers'; 'Teutonic Cremation'; 'Yggdrasil, or The Teutonic Tree of Existence'; biographies of Freiligrath, Ledru Rollin, and Francis Deák.

Blind, Mathilde, German-English poet: b. Mannheim, 21 March 1847; d. London, 26 Nov. 1896. She went to England in 1849, and won fame by her writings: 'The Prophecy of St. Oran, and Other Poems' (Lond. 1881); 'Life of George Eliot' (1883); 'Madame Roland' (1886); 'The Heather on Fire,' a tale (1886); 'Ascent of Man' (1889); 'Dramas in Miniature' (1892); 'Songs and Sonnets' (1893); and 'Birds of Passage' (1895).

Blind. The loss of the sense by means of which man receives an idea of the world that surrounds him, clothed in light and color, is an event as melancholy as it is frequent. Blindness is different: (1) In its degrees, some persons being partially blind, retaining a slight perception of light, with the power of distinguishing very brilliant colors, and the general outlines of bodies; others being entirely deprived of the faculty of seeing. (2) In its causes: some men are blind from their birth; others have become blind by local diseases of the eyes,—for instance, —by inflammation, suppuration, cancer of the eye-ball, spots, films, tumors on the cornea (by which its transparency is destroyed), also by closure of the pupil, by a turbid state of the humors, by a debility of the optic nerve, or by general diseases of the body, violent fevers, nervous fevers, plethora, and tendency of the blood to the head, erysipelas in the face, smallpox, scarlet-fever, etc., or by excessive exertion of the eyes, by which the optic nerve is enfeebled; for which reason, some classes of mechanics and artists, as blacksmiths, laborers in glass and smelting houses, watch-makers, etc., not unfrequently lose their sight, and in northern countries, which are covered with snow for a long time, and which dazzle the eyes by the reflection of the sunbeams, as well as in the sandy deserts of Africa, blindness is a frequent complaint. Old age is sometimes accompanied with blindness, occasioned by the drying up of the humors of the eye, or by the opacity of the cornea, the crystalline lens, etc. There are several causes which may produce blindness from birth. Sometimes the eyelids adhere to each other, or to the eye-ball itself, or a membrane covers the eyes; sometimes the pupil of the eye is closed, or adheres to the cornea, or is not situated in the right place, so that the rays of light do not fall in the middle of the eye; besides other defects. Those who are born blind have no idea of vision, and are entirely destitute of all the ideas derived from the sense of sight. They cannot, therefore, be sensible of their misfortune in the same degree as those who have lost their sight at a later period. Experience has shown that those who acquire the power of seeing after being born blind, or having lost their sight in their childhood, form very different ideas of visible objects from other

persons. A young man, whom Cheselden couched for a cataract, at the moment he received sight imagined that all the objects which he saw were in contact with his eyes; he could not distinguish objects, although of very different forms. Those with which he was already familiar by the touch he examined with great attention, in order to recognize them another time; but having too many things to notice at once, he soon forgot all that he had observed. He wondered that those persons whom he loved most were not handsomer than others. Before he received his sight he had expressed a great desire to obtain this sense. The other senses of persons, who have been blind for a long time, become more exquisite, perhaps, because they are not subject to the distraction produced by the sight of so many objects. The blind, therefore, are often distinguished for a remarkable mental activity, and a wonderful development of the intellectual powers. Their touch and hearing, particularly, become very acute. Thus it is related of a blind man, who lived at Puiseaux, in France, and was a chemist and musician, that he could accurately estimate the proportions of objects, could judge of the distance of fire by the degree of heat, determine the quantity of fluid in vessels by the sound it produced while running from one vessel into another, and the proximity of objects by the effect of the air upon his face. He determined very accurately the weights of bodies and the capacities of vessels. The celebrated Saunderson, professor of mathematics at Cambridge, lost his sight in his early youth. He invented several processes to facilitate his studies in arithmetic and geometry. His sense of touch was so acute that he distinguished spurious coins merely by letting them pass through his fingers, though they were so well executed that even skilful judges were deceived by them.

When it is a case of imparting instruction to persons destitute of sight, it is necessary to have recourse to the other senses to supply the want of the eye. If, for instance, we wish to teach them the arts of reading and writing, letters must be prepared which will be palpable to the touch, and the hand guided until they are able to copy them. If we wish to communicate to them a knowledge of the surface of the earth, globes and maps must be prepared with the divisions, etc., in relief. Knowledge obtained in this way must, of course, be acquired much more slowly than that received by the sight. The senses of touch and of sight differ in this respect, that the former ascends by degrees from the perception of parts to the perception of the whole, while the latter views the whole at a single glance. It is therefore evident that the blind cannot be instructed in the common schools destined for those who see: in the first place, because the means of instruction by the touch are wanting; and secondly, because the progress of the other children would be retarded by the slow apprehension of the blind pupils. (See BLIND, EDUCATION OF THE.)

The occupations in which the blind are found capable of engaging are such as the making of baskets and other kinds of wicker-work, brush-making, rope and twine-making, the making of mats and matting, knitting, netting, fancy work of various kinds, cutting fire-wood, the sewing of sacks and bags, the carving of articles in wood, etc. Piano-tuning is also successfully car-

BLIND, EDUCATION OF THE

ried on by some, the typewriter is used by others and the cleaning of clocks and watches has also been occasionally practised by them. Skilled musicians are sometimes found among the blind.

Reading Room for the Blind.—By an act of Congress passed in 1879, entitled an Act to Promote the Education of the Blind, \$250,000 was set apart to be permanently invested in securities of the United States, the proceeds of which were to be applied, through the American Printing House for the Blind at Louisville, to the making of books and apparatus used in the education of the blind, to be annually distributed to the schools for the blind in the several States in proportion to attendance. For almost a quarter of a century this benefaction has been available for the youthful blind of the country in the schools, and the books in embossed characters have multiplied amazingly. The catalogue now embraces nearly or quite every title in popular literature and technical subjects, and as only the best books are printed in raised letters, the entire catalogue constitutes the finest and best library of equal numbers in the world. There is a steady increase in the number of visitors in the reading room for the blind in the library of Congress. To Helen Marr Campbell is given by many the credit of having taken the initial steps to procure this reading room. She was a frequent visitor to the crowded rooms of the old Congressional Library, and often found the experiences there far from agreeable. The few books for the blind were often difficult to obtain and equally difficult to read in cramped rooms, and too often under the scrutiny of curious and annoying strangers. Going to John Russell Young, then librarian, she made a request for a special reading room in behalf of the blind readers of Washington. He was quick to see the justice of the request, and at once placed the fitting up of Pavilion No. 7 in the new library in charge of the second assistant librarian, David Hutcheson. This is in the extreme northwestern corner of the ground floor of the great building and is a large and well-appointed room, with square bay windows and a groined ceiling resting upon massive pillars. The alcoves along the eastern wall are filled with the specially prepared books for the blind; the Bible, making so many large volumes that it completely fills one of the alcove shelves.

Dictionary for the Blind.—The first general dictionary ever issued in any country or language was published in 1903 by the Maryland School for the Blind. It contains 40,000 words, with complete diacritical marks and definitions and fills 18 volumes. In the last 10 years more books have been printed for the blind than in all previous time. This is due largely to the rapid spread of the New York point system of printing for the blind. The new dictionary, as well as all the books from the Maryland School printing house, is printed in New York point. The American Printing House for the Blind at Louisville expends its annual subsidy of \$10,000 entirely in New York point printing. The annual appropriation of \$1,000 by the State of New York for the publication of general literature for the blind department of the State Library at Albany goes into New York point. The International Sunday-School Lessons go out weekly over the United States in New York point. Three periodicals are published in it. There is an excellent musical library in it, including a

dictionary of 6,000 musical terms. The Society of St. Francis Xavier uses the system in its publishing house for the blind.

Photophonic Books for the Blind.—A sheet of transparent paper contains, printed upon a black background, a number of small white squares, separated from each other by intervals one, two, or more lengths of a square in size. These squares, together with the intervals, represent the letters of the alphabet, exactly as do the dots and dashes of Morse. In order to enable the blind to read these letters, the printed sheet is placed in a frame between two thin plates of glass fully exposed to the light, and an opaque piece of cardboard, or some other material, with a square-shaped opening in the centre, is moved by the reader along the printed lines from left to right. Whenever the opening passes over one of the white transparent squares, the rays of light illuminating the printed sheet pass through this opening, and, by means of a photophonic apparatus, are changed into sound. In this way, the blind reader receives the letters in the form of sounds separated by longer or shorter intervals of silence, and his ear fulfills the functions of the eye.

Blind, Education of the.—When it is stated that prior to 1830 the blind of America were to be found "moping in hidden corners or degraded by the wayside, or vegetating in almshouses," it is the adult blind that is meant. Still blind children were occasionally found in these places, though it could scarcely be said that they were vegetating, as could be said of the untrained deaf children.

The British census of 1851 first showed the world that over 80 per cent of the blind are adults. Our schools for the blind were started, *first*, because of the wide-spread interest in the results of educating the young deaf and dumb, which furnished inspiration for new fields of educational endeavor; *secondly*, because the country was coming to the conviction that all the children of the state should receive education both as a matter of public policy and as a private right; and *thirdly*, because reports of what had been accomplished abroad in schools for the blind were being promulgated in our land. By 1830 the more progressive states of the east were ready to give their blind children school training. In that year the government first included in the national census the deaf and dumb and the blind. The work of the blind was to begin with scientific foreknowledge as to their number. In 1829 certain gentlemen in Boston obtained the incorporation of the "New England Asylum for the Blind." By a most fortunate circumstance, the interest and services were obtained of a graduate of Brown University, Dr. Samuel G. Howe, who after finishing his medical studies had chivalrously gone to the aid of the Greeks. Dr. Howe went at once to Europe to study methods of instruction. Upon his return, in 1832, the school was opened with six pupils. In New York the act of incorporation of the New York Institution for the Blind was passed in 1831; but funds were needed and no one went abroad to study methods. This school opened in March, 1832, antedating by a few months the school at Boston. In the very same year a German teacher of the blind, a Mr. Friedlander, most

BLIND, EDUCATION OF THE

opportune came to Philadelphia, in the hope of starting a school for the blind there. Having trained certain blind children he exhibited their accomplishments, *first*, to a few influential people, *secondly*, before a large audience among whom he distributed a leaflet, "Observations on the instruction of blind persons." A meeting of public-spirited citizens followed, funds were liberally contributed, fairs held, and the success of the cause was assured. The Pennsylvania institution for the instruction of the blind was opened in 1833, fully ten months before an act of incorporation was obtained. The three schools at Boston, New York, and Philadelphia are called the pioneer schools. All sprang from private effort and private funds. All were incorporated as private institutions, and remain so to this day. Two similar institutions for the blind have arisen in this country, that at Baltimore and that at Pittsburg.

The origin of the State schools differs from that of the type above given only in that classes of trained pupils from the earlier schools were exhibited before the state legislatures, as well as before the people. State appropriations followed and the institutions were inaugurated as state institutions. The new schools sprang into being with astonishing rapidity. There were in 1899 forty schools for the blind in the United States, and every State in the union makes provision for its blind of school age either in its own school or in that of a neighboring state. In our sparsely-settled country, especially west of the Alleghenies and south of Maryland, great efforts had to be made to find the children and still greater efforts to persuade the parents to send them to school. In certain states where the amount of the public fund seemed to preclude a special grant for the blind, pupils of this class were brought together in connection with a school for the deaf and dumb, forming "dual schools," as they are called. These institutions could not help being unfair to their blind contingent; for in nearly every such case the blind came to a school already established as a school for the deaf, and under the superintendence of a man especially interested in the education of the deaf; moreover, the number of the deaf pupils usually far exceeded that of the blind. There are still a few of these dual schools, but wherever possible they have been divided into two distinct institutions. In northern schools the colored blind are educated with the white; in southern schools it is best for the colored to have schools of their own. Both the whites and they prefer this arrangement. The first school for the colored blind was opened in North Carolina in 1869.

All the institutions for the blind were in their very inception schools. The pioneer schools imported literary teachers from Paris and handicraft teachers from Edinburgh. At first only the brighter class of pupils came under instruction. Teaching them was easy. They progressed with amazing strides; all was enthusiasm; exhibitions were called for and widely given (Dr. Howe's pupils gave exhibitions in 17 states); large editions of the various annual reports were exhausted. Soon, however, less bright pupils came to be admitted; then the curriculum of studies began to sober down to the practical and comprehensive one prevailing to-day. Whatever occupation the boy

or girl expects to follow after leaving school, it is assumed he will follow it better and thus live more happily and worthily if he has a general education. When, as was formerly the case, the period or term of schooling allowed pupils was shorter than it is now, they were not admitted before the age of eight or nine. Now that kindergarten departments have been universally added to the schools, the pupils are urged to enter at an early age; because experience has shown that at home these little blind folks are coddled rather than trained, so much so in fact that by the time many of them come to school their natural growth of body and mind has been so interfered with by inaction, that all the efforts of the schools cannot make up for lost time and opportunity. The principle of periodicity of growth has now come to be understood and the importance of applying the proper stimulus at the period most sensitive to it, comprehended. Children with good sight and hearing have got along without kindergarten training, and so have blind children, but of all the useful means of reaching and developing the average blind child none is so effective as the properly-conducted kindergarten. The practical knowledge of things comes to the blind through the hand, their fingers being veritable projections of their brains. Thus must their hands not only be trained to sensitiveness of touch but to be strong and supple, so that they may, indeed, be dexterous; for as their hands are so are their brains. The kindergarten cultivates ear and heart and hand and brain as nothing else does. Even color is not wholly omitted in kindergartens for the blind. Many see colors, and those who do not love to talk about them and certainly derive some indirect value for considering them.

Blind children with kindergarten training are more susceptible to instruction than those without it. Above this department the course of studies in American schools requires from seven to eight years, which means a primary, a grammar and a high school education, or instruction in object lessons, reading, writing, spelling, grammar, composition, arithmetic, history, physiology, botany, zoölogy, geology, physics, algebra, geometry, civics, English literature, typewriting and sometimes Latin and modern languages. Not a few pupils have fitted for college where they took the regular course with the seeing students, and from which they were graduated usually with distinction. Formerly much of the teaching was oral, which, in many cases, was apt to be more pleasant than profitable to the pupil. Since the general introduction of the embossed text book and tangible writing, the pupil has been forced to depend more and more upon himself, obviously with better results. In fact, the work has been growing more and more practical. The methods of teaching the blind correspond in general to those of teaching other hearing children. The common appliances have but to be raised and enlarged as in maps and diagrams, or simply made tangible, which may be done, for example, by notching an ordinary ruler so that the gradations can be felt.

Industrial training has been an integral part of the school course from the beginning. Recently educational manual training has been generally introduced as preliminary to the

BLIND, EDUCATION OF THE

trades. Sloyd has been found especially adapted to the blind. The handicrafts — chair-caning, hammock-making, broom-making, carpet-weaving, and a few others, alone remain of all the many trades taught at one time or another in our schools. Manual occupations of some kind will always be taught, even were it evident that none of them would be followed by the blind as trades; for it is by doing and making that the blind especially learn best. Then, it is essential that they be kept occupied. In the past, before the introduction of such varieties of labor-saving machinery as the last half century has seen, many of the discharged pupils followed some manual trade and succeeded in subsisting by it. To-day this is less and less possible. The mind itself of the blind is least trammelled by the lack of sight; hence some pursuit where intelligence is the chief factor would seem to be best adapted to his condition. Music, of course, opens up his most delightful field. It is said that all the force of the superintendents of the early schools was required to prevent the institutions from becoming mere conservatories of music. To-day only those pupils pursue music in regular course who have talent for it; but even those are not allowed to neglect other studies for it. It is the experience of the American schools, as of the European, that the profession of music offers to the educated and trained musician who is blind, a field in which he can work his way with least hindrance from his lack of sight, and many are they who have found in it a means of livelihood for themselves and their families. A few in nearly every school fit themselves to be tuners of pianos.

The American schools for the blind were founded upon embossed books. Dr. Howe states somewhere that the simple reading from embossed print did more to establish the schools in the country than any other one thing. Extraordinary pains were taken by Dr. Howe and his assistants to perfect a system which should be at once readily tangible to the fingers of the blind and legible to the eyes of their friends. The result was the small lower-case letter of Dr. Howe, the Boston line print, as it is often called. To this the jury gave preference before all other embossed systems exhibited at the great exhibition of the industry of all nations, in London, in 1851. Backed by such indorsement and all the authority of Dr. Howe the system was rapidly adopted into the American schools. It was then the theory that the blind would be further isolated from their friends if their alphabets were dissimilar. The blind of themselves had devised a writable system — arbitrary and composed of dots or points — one which they could both read and write. But the early superintendents would not countenance it. However, many of the blind failed to read the line-letter system; because to read it requires extreme nicety of touch, which all the blind by no means have. Characters composed of points, not of lines, are scientifically adapted to touch reading. In the 33d report of the New York institution, Supt. William B. Wait wrote: "Now, which is the more important, that all the young blind should be able to read, thus being made, in fact, like the seeing, or that they should be taught an *alphabet which in some sort resembles* that used by the seeing, but by doing which only 34 per cent of them

will ever be able to read with any pleasure or profit?" This attitude of the New York school was the outcome of statistics gathered from seven institutions, in which 664 pupils were involved, and of experiments made by Mr. Wait with his own pupils, using a system scientifically devised by him, composed of points in arbitrary combination. This was in 1868. At the next convention of the American instructors of the blind, it was resolved "That the New York horizontal point alphabet as arranged by Mr. Wait should be taught in all institutions for the education of the blind." Europe was a long time accepting a writable point system. That of Louis Braille, devised in 1829, though much used by individuals, was not officially adopted into the Paris school where it originated until 1854. In contrast, America devised, printed, spread, and resolved to accept its writable system in less than one-half the time. The benefits of a tangible writable system are vast. It puts the blind more nearly on a par with the seeing, particularly as pupils in school. Its adoption here, next to that of tangible printing, makes obtainable the ideal of American schools for the blind. Every tangible system has its defects. French "braille" as adopted into England has antiquated abbreviations and contractions for the use of adults; and is involved with rules allowing much bad use, like the omission of all capitals. The New York point as printed also laid itself open to much criticism as to "good use." The American braille, the latest system, combining the best features of French braille and of New York point, was devised by a blind teacher of the Perkins institution. It takes full account of "good use," and those who use the system deem it very satisfactory. In 1892, when the American braille system was adopted into several schools, a typewriter for writing braille was invented, and this was followed by the invention of another machine for embossing braille directly on plates of thin brass from which any number of duplicates could be struck off on paper. Here was a means of creating a new library at once. But the chief value of the invention lay in the fact that as the machine was simple and inexpensive and could be operated if necessary by a blind man, any institution could have a printing office of its own. And several schools immediately established such offices, from which they issued at once whatever their school classes demanded. By co-operating in the selection of the books to be embossed these schools have created in the space of seven years a library of books in American braille than which there is no superior in any system in any country, and they have added an immense amount of music in the braille music notation, which is the same all over the world. A typewriter, and a machine for embossing brass plates in the New York point system, have also appeared.

The Association of American instructors was formed in 1871, has met biennially ever since, usually as the guest of one or another of the institutions. The proceedings of each convention have been published. The principles underlying the scheme for educating the blind being to make them as little as possible a class apart from the rest of the community, it has not been deemed wise to attempt to establish a national college for the higher education of

BLIND FISHES — BLINDAGE

those capable of taking it, but efforts are making towards enabling the brighter and worthier pupils to attend one of the colleges for the seeing, at the expense of the states or the schools from which they come. The school instruction of the blind is comparatively an easy matter. The work is less of a science than the more difficult task of instructing the deaf.

When an exhaustive census of the graduates from all over the country was compiled, it revealed the following encouraging facts: 16 became superintendents of other institutions; 214 became teachers or were otherwise employed in institutions; 34 became ministers of the gospel; 84 authors, publishers, or lecturers; 310 were engaged as teachers of music or were vocalists outside of institutions; 69 had been organists in churches; 125 piano tuners; 937 had been engaged as teachers, employees, and workers in handicraft; 277 were storekeepers, etc.; 45 became owners and managers of real estate; 760 (mostly women) were employed at housework at home or in families, or at sewing with machines, or by hand, and 78 were in homes of employment. Further, according to the 11th census of the United States (1890) when there were 50,568 blind in the land, but 2,560 were found in almshouses. What proportion of these ever attended our schools, will never be known, but it must be remembered that blindness is an affliction of old age.

EDWARD ELLIS ALLEN,

Principal Pennsylvania Institution for the Instruction of the Blind.

Blind Fishes. See CAVE ANIMALS.

Blind Spot. The place of entry of the optic nerve in each retina is insensitive to light. Mariotte in 1668 first demonstrated the existence of the blind spot. Its existence may be easily shown as follows: Pin a large sheet of paper against the wall so that a cross marked thereon may be at the level of the eyes; fix the position of the head by means of a headrest (a ruler about 50 centimeters in length, held by the teeth at one end, the other end resting against the paper, is a convenient headrest); with one eye closed or covered, look steadily at the cross with the other eye; move a pencil, that has been covered with paper so that the point only shows black, from the cross toward the temporal side of the field of vision; mark on the paper the position at which the pencil point disappears; move the pencil farther and mark the

position at which the point re-appears. By moving the point in various directions near this place on the paper, and marking the positions where the pencil point disappears, and re-appears, a series of marks may be made which furnish an outline figure of the form of the blind spot. The diameter of the blind spot (1.5 mm.) corresponds to a visual angle varying from $3^{\circ} 39'$ to $9^{\circ} 47'$. The average is about 6° . An image of light sufficiently small thrown upon the optic nerve by means of the ophthalmoscope, gives rise to no sensations. These experiments show that at the blind spot we see nothing, yet, as we look at this page with one eye only the surface appears to be covered with letters in the regular forms; there is no blank space corresponding to the blind spot. In binocular vision the blind spot of one retina is covered with a sensitive portion of the other retina. Why we should not be aware of our inability to see a continuous field with one eye, is a problem for which there are two proposed explanations. The blind spot may be filled out by association, whose nature is determined by the character of the surrounding field, or, by eye movements which serve as retinal local signs for the insensitive region. Probably the two processes are necessary and aid each other in presenting to the mind the continuous visual field. Consult: Ladd, 'Elements of Physiological Psychology'; Helmholtz, 'Physiologische Optik' (1901); Sandford, 'Course in Experimental Psychology' ex. 113, 114; Wundt, 'Physiologische Psychologie' (1893); Titchener, 'Experimental Psychology.'

Blind Tom (BETHUNE, THOMAS), a musical freak: b. about the middle of the 19th century. He was a negro slave in Georgia, and was born blind and with very weak mental development. He showed remarkable aptitude for music and after hearing a piece played once could reproduce it accurately on the piano. He also performed other musical wonders, and for several years was exhibited in various cities. His lack of intellect developed into almost brutal idiocy, and he disappeared from the public eye.

Blindage, in operations against fortresses, the name of all preparations which tend to intercept the view of the enemy. There are several species: (1) A fascine placed across the embrasures, to prevent the enemy from observing what passes near the cannon. (2) Blinds before port-holes are shutters made of strong planks, placed before the port-holes, as soon as the guns are discharged, to obstruct the enemy's view. (3) Single and double blinds. The former consists of three strong perpendicular posts, five feet in height, between which are planks covered with iron plates on the outside, and thus made shot-proof. This screen is furnished with rollers, to enable the laborers in the trenches to push it before them. The latter consists of large wooden chests, on four block wheels, filled with earth, or bags of sand, and serve likewise in the trenches, etc., to cover the soldiers from the fire of the enemy. (4) Chandeliers used to protect the workmen in the trenches. Two square beams of timber are placed parallel, and at a distance of six feet, on the ground, and fastened by two cross beams. Upon the ends perpendicular posts are erected, and the interval is filled up with fascines, at least to a height of five feet. (5) Coverings placed over the most exposed parts in the saps or the fortress.

These are made of beams over which hurdles or fascines are spread, that finally receive a sufficiently thick layer of earth as a covering. During the Boer war of 1899-1902 Ladysmith, Mafeking, and Kimberley were largely defended by means of bomb-proof shelters or blinds.

Blindness, inability to see, resulting from disease or injury of the external eye, of the light-receiving portions of the eye, the retina, of the nerve-conducting paths, the optic tracts, or of the light-perceiving or intellectual centres in the occipital cortex of the brain. It may be transitory or permanent, partial or complete, congenital or acquired, curable or incurable. There is a form of night-blindness, in which dim light fails to give impressions; or of day-blindness, in which excess of light is obstructive to vision. Certain regular or irregular areas on the retina may be blind; one half of one eye or of both eyes may be blind. Blindness to certain colors is a well-known form of this affection. Objects may look too small, or too large, or be distorted. See AMAUROSIS; AMBLYOPIA; BLIND; EYE, DISEASES OF.

Blinds, screens or shutters to prevent too strong a light from shining in at a window, or to keep outsiders from seeing in. Venetian blinds are made of slats of wood, so connected as to overlap each other when closed, and to show a series of open spaces for the admission of light and air when in the other position.

Blindsnake, a family of small serpents (*Typhlopidae*) having worm-shaped bodies, only a few inches in length, very rigid, and suited for burrowing. These little snakes exist in all warm countries, and lead a subterranean life, worming their way through the loose top-soil, and feeding on earth-worms, grubs, and insects. Their eyes, through disuse, have become minute and weak, and in many species almost covered by overlapping plates. In India they sometimes come out upon the surface after showers, when they are regarded with superstitious dread by the natives; but they are perfectly harmless. Many species inhabit Mexico and tropical America, two or three occurring in New Mexico and Texas, where they are frequently found in ant-hills.

Blindstory. See TRIFORIUM.

Bliss, Aaron Thomas, American politician: b. Smithfield, N. Y., 22 May 1837. He served in the Federal army during the Civil War, and was for six months a prisoner in Andersonville, Columbia, and other Southern prisons. In 1865 he settled in Saginaw, Mich., where he has been engaged in lumbering, banking, and other business enterprises. He was a member of Congress, 1889-91, was elected governor of Michigan in 1900, and re-elected 4 Nov. 1902.

Bliss, Cornelius Newton, American merchant and statesman: b. Fall River, Mass., 26 Jan. 1833. He was educated in New Orleans; entered his stepfather's counting room there; engaged in the commission business in Boston, and became head of the dry goods commission house of Bliss, Fabyan & Company, New York, in 1881. He was a member of the Pan-American Conference; chairman of the New York Republican State Committee 1877-8; and treasurer of the National Republican Committee in 1892 and 1896; declined to be a candidate for gov-

ernor of New York in 1885 and 1891; and was secretary of the Interior Department in President McKinley's Cabinet in 1897-8.

Bliss, Daniel, American missionary: b. Georgia, Vt., 17 Aug. 1823. He graduated at Amherst College in 1852, and at the Andover Theological Seminary in 1855; was ordained a Congregational minister 17 Oct. 1855; engaged in missionary work in Syria in 1855-62; and in 1866 became president of the Syrian Protestant College of Beyrout. His publications include: 'Mental Philosophy' and 'National Philosophy,' both in Arabic.

Bliss, Edwin Elisha, American missionary: b. Putney, Vt., 12 April 1817; d. Constantinople, 29 Dec. 1892. He graduated at Amherst College in 1837, and at Andover Theological Seminary in 1842; was ordained as a missionary in 1843, and joined the American Mission in Turkey, being stationed at Trebizond, 1843-52; Marsovan, Armenia, 1852-6; and at Constantinople after 1856. In addition to the ordinary work of a missionary he edited, 1865-92, the 'Messenger,' published at Constantinople in the Turkish and Armenian languages, and compiled a number of text-books, notably the 'Bible Handbook,' in Armenian.

Bliss, Edwin Munsell, American missionary: b. Erzerum, Turkey, 12 Sept. 1848. He was educated at Robert College, Constantinople; at the high school, Springfield, Mass., and at Amherst College, where he graduated in 1871, later taking a course at Yale Divinity School. In 1872 he was sent to Constantinople as agent for the American Bible Society, and traveled in Turkey and Persia. On his return to the United States in 1888 he edited the 'Encyclopædia of Missions.' He has also written 'The Turk in Armenia, Crete, and Greece,' and 'A Concise History of Missions.' Since 1896 he has been associate editor of the New York 'Independent.'

Bliss, Frederick Jones, American explorer (son of Daniel Bliss, q.v.): b. Mount Lebanon, Syria, 23 Jan. 1859. He graduated at Amherst College in 1880, and at the Union Theological Seminary in New York in 1887; was principal of the preparatory department of the Syrian Protestant College of Beyrout for three years; was appointed explorer to the Palestine Exploration Fund in 1890, and is best known for his excavations and finds in Jerusalem in 1894-7. Here he unearthed an ancient city wall with towers, besides streets, drains, stairways, churches, and other structures. He has published 'Mounds of Many Cities'; 'Excavations at Jerusalem,' etc.

Bliss, George, American lawyer: b. Springfield, Mass., 3 May 1830; d. near Wakefield, R. I., 2 Sept. 1897. He graduated at Harvard College in 1851; studied for two years in Berlin and Paris, and after his return read law principally at the Harvard Law School. He established himself in practice in New York. In 1859-60 he was private secretary to Gov. Morgan; in 1861 was appointed to his staff; in 1862 became paymaster-general of New York; and in that and the following year organized three regiments of United States colored infantry under instructions from the secretary of war. In 1866 he was appointed attorney for the Metropolitan boards of excise and health; in 1872, United States attorney for the Southern District of New York, and in 1881 a

special assistant to the United States attorney-general for the prosecution of the 'Star Route' postal cases. He drafted the New York charter of 1873; drew up the New York Consolidation Act, and was author of the first tenement-house act for the city. He published three editions of the 'Law of Life Insurance' and four editions of the 'Annotated Code of Civil Procedure.'

Bliss, Philip Paul, American singing evangelist: b. Clearfield County, Pa., 9 July 1838; killed in railroad accident, Ashtabula, Ohio, 29 Dec. 1876. He received some musical instruction from G. W. Root, but was very largely self-taught. His evangelistic work was done chiefly in conjunction with Maj. D. W. Whittle and D. L. Moody, who became his warm friend and admirer. He had a fine personal presence, a gift of ready and effective speech, and these, combined with his wonderful voice, which appealed strongly to the hearts of the multitude, gave him great power over his audiences. He frequently composed both the words and music of the songs which have made his name known throughout Christendom. Of these the most popular are: 'Hold the Fort, for I am Coming'; 'Down Life's Dark Vale We Wander'; 'Jesus Loves Me'; 'Hallelujah! 'Tis Done'; and 'Pull for the Shore, Sailor.' His services as a revivalist were in demand throughout the United States and Canada. His songs appeared in the following named collections: 'The Charm' (1871); 'The Song Tree' (1872); 'The Joy' (1873); 'Gospel Songs' (1874).

Bliss, Porter Cornelius, American diplomatist: b. Erie County, N. Y., 28 Dec. 1838; d. New York, 2 Feb. 1885. He was educated at Hamilton and Yale colleges; became private secretary to James Watson Webb, United States minister to Brazil; explored the Gran Chaco for the Argentine government; compiled the various Indian dialects, and investigated the antiquities of that region; and in 1866 became private secretary to Charles A. Washburn, United States minister to Paraguay. He was commissioned by President Lopez to write a history of Paraguay, and while doing so war broke out between that country and Brazil, and he was imprisoned and tortured on suspicion of being a Brazilian spy. It required the presence of an American squadron to effect his release. In 1869-70 he edited the *Washington Chronicle*; in 1870-4 he was secretary of the United States legation in Mexico, and during that time made several archaeological explorations and wrote on the opportunities of American enterprise in that country. In 1874-8 he was an associate editor of 'Johnson's Universal Cyclopædia,' and in 1879 went to South America as correspondent for the *New York Herald*.

Bliss, William Dwight Porter, American clergyman: b. Constantinople, 1856. He graduated at Amherst College in 1878, and at Hartford Theological College in 1882; was ordained a Congregational clergyman; became an Episcopal priest in 1887; organized the first Christian Socialist Society in the United States in 1889, and was president of the National Reform League. He edited 'The Dawn' (1889-96); 'The American Fabian' (1895-6); and the 'Encyclopædia of Social Reform,' and published a 'Handbook of Socialism.'

Bliss, William Julian Albert, American physicist: b. Washington, D. C., 1867. He graduated at Harvard University in 1888 and pursued a course of studies in electrical engineering at Johns Hopkins, Baltimore, at which university he became successively assistant in physics (1895-8), associate (1898-1901), and professor in the latter year. He is the author of several works bearing on his profession.

Blister, a local collection of blood serum beneath the cuticle. Blisters may be produced by a variety of agents. In all instances, however, there is irritation of the part; this is followed by dilated blood vessels and an exudation of the serum from the blood vessels near the irritant. Medicinally, blistering agents or irritants may be classified in four principal groups, as follows: rubefacients, when redness alone is produced; vesicants, when blistering is brought about; pustulants, when the blisters are usually small and contain pus; and escharotics, when burning or destruction of tissue may take place. Heat is an excellent illustration. Mild heat will cause redness; temperature above 125° to 400° F. will cause blistering; temperature above 400° will burn; and high temperatures can char. The most commonly used blistering agents are heat (the hot iron being lightly touched to the skin), mustard, capsicum, mezereum, turpentine, and cantharides. The hot iron and cantharides are preferred, because their action can be controlled. Mustard mixed with cold water makes an excellent rubefacient, but it is not advised to be used as a vesicant. Blisters are used to influence deep-seated and chronic joint, muscle, and tendon troubles. For general purposes of counter-irritation rubefacients are more serviceable than vesicants.

Blister-beetle, or **Spanish Fly**, an oil-beetle of the family *Meloidæ*, in which there is a small head and a distinct neck; the wing-covers and sides of the body without any co-adaptation, while each claw of the feet bears a long appendage closely applied beneath it. The integument is soft, flexible, and many of the species contain a substance which forms an active vesicant, called cantharidine. The Spanish fly (*Lytta vesicatoria*) is larger than any of our native species, is of a bright shining green, and when powdered and applied to the skin raises blisters. It inhabits the south of Europe, and is usually imported from Spain. Our native blister-beetles, when dried, can also be used for producing blisters or making blister-plasters. They are black or gray, and occur on potato plants, on the flowers of the golden-rod, etc. Their transformations are wonderfully complicated, since they pass through more than one larval stage (see METAMORPHOSIS). The females lay their eggs in the earth; the young, on hatching, are of a singular primitive shape, called a "triungulin," which is very active, entering the egg-pods and devouring the eggs of locusts. It soon molts, assuming a different but still active larval stage; it molts again, entering its third larval stage, when it resembles the grub of a May beetle (scarabæid stage). In the fourth stage the grub is helpless, lying on one side; it increases rapidly in size, and when fully grown leaves the remains of the egg-pod it has been living on and forms a small cavity near by. Here it lies motionless on its side, but grad-

ually contracting till the skin separates and is pushed down to the end of the body, disclosing the semi-pupa or coarctate larva, which hibernates. In the spring the skin bursts and discloses a sixth larval form like the fourth. In this stage it is again active, burrowing in the earth, but taking no food, and in a few days passes into the pupa state. Other species of the family pass through a similar hypermetamorphosis.

Blister-steel. See STEEL MANUFACTURE.

Blithedale Romance, The, the third of Nathaniel Hawthorne's romances, published 1852. It was the outcome of an intimate acquaintance with the members of the Brook Farm (q.v.) Community, and immortalized the brief attempt of that little group of transcendentalists to realize equality and fraternity in labor. It is more objective and realistic than Hawthorne's other works, and therefore in a sense more ordinary. Its central figure is Zenobia, a beautiful, intellectual, passionate woman; drawn as to some outlines, perhaps, from Margaret Fuller. At the time it opens she has taken up her abode at Blithedale Farm, the counterpart of Brook Farm. The other members of the community are Hollingsworth, a self-centred philanthropist; a Yankee farmer, Silas Forster, and his wife; Miles Coverdale, the relater of the story; and Priscilla, who is Zenobia's half-sister, though of this fact Zenobia is ignorant. 'The Blithedale Romance' is a brilliant instance of Hawthorne's power as a story-teller. No scene in the whole range of fiction is more realistic than the finding of Zenobia's body in the dead of night; drawn from the dank stream, a crooked, stiff shape, and carried to the farmhouse where old women in nightcaps jabber over it. Nothing could be more in the manner of Hawthorne than his comment that if Zenobia could have foreseen her appearance after drowning, she would never have committed the act.

Blizzard, a peculiarly fierce and cold wind, accompanied by a very fine, blinding snow which suffocates as well as freezes men and animals exposed to it. The origin of the word is dubious. It came into general use in American newspapers during the bitterly cold winter of 1880-1, although some papers claim its use as early as the seventies. Such a storm comes up very suddenly and overtakes the traveler without premonition. The sky becomes darkened, and the snow is driven by a terrible wind which comes with a deafening roar. One of the most severe of these storms recorded in the West was that of January 1888 which extended from Dakota to Texas. The thermometer in some places fell from 74° to -28° F., and in Dakota to -40°. The number of deaths amounted to 235. Children were frozen on their way home from school, and farmers in their fields, and travelers were suffocated by the fine snow. The blizzard which will long be remembered in the eastern States began 11 March 1888, and raged until the 14th, New York and Philadelphia being the cities most affected. The wind at one time blew at the rate of 46 miles an hour. The streets and roads were blocked, railroad trains snowed up for days, telegraphic communication cut off, and many lives were lost.

Blizzard State, a nickname for South Dakota.

Bloat, Hoven, or Tympanites, a diseased condition of sheep or cattle, consisting of distention of the first stomach (rumen) and commonly caused by an overabundance of leguminous diet. Animals unaccustomed to graze in clover are liable to the malady, but over-eating of grain may also produce bloat. The use of cathartic remedies, such as Epsom salts or linseed oil, will often prove effective, except in severe cases. Sometimes the accumulation of gas in the rumen is so abundant and distressing that relief must be obtained by an incision made by a surgical instrument.

Bloch, Karl Heinrich, Danish painter: b. Copenhagen, 1834; d. 1890. He studied at the Copenhagen Academy and in 1852 went to Italy where he spent about 12 years. In 1883 he became a professor in the Academy in which he had been trained. Although his chief paintings are historical, he was also successful in nature-studies, and some of his pictures are notable for their humorous characteristics. Among his works are: 'Peasant's Cottage'; 'Roman Street Barber'; 'James of Scotland Visiting Tycho Brahe'; 'Christian II.'; and two frescoes in the Copenhagen University.

Bloch, Marcus Eliezer, Jewish naturalist: b. Anspach (of poor parents), 1723; d. 1799. In the 19th year of his age he understood neither German nor Latin, nor had he, with the exception of some rabbinical writings, read anything. Nevertheless he became tutor in the house of a Jewish surgeon in Hamburg. Here he learned German and Latin, and besides acquired some knowledge of anatomy. His principal work is the 'Natural History of Fishes' (folio, 1785-99), adorned with many colored plates.

Block, or Blok, Adriaen, Dutch navigator who visited Manhattan (now New York) about 1613 and again in 1614 in the Tiger. This ship being accidentally burned he built the Unrest, a craft of 16 tons, in which he coasted as far north as Nahant, discovering the Housatonic and the Connecticut rivers and the island which bears his name. See BLOCK ISLAND.

Block, a mechanical contrivance consisting of one or more grooved pulleys mounted in a casing or shell which is furnished with a hook, eye, or strap by which it may be attached to an object, the function of the apparatus being to transmit power or change the direction of motion by means of a rope or chain passing round the movable pulleys. Blocks are single, double, treble, or four-fold, according as the number of sheaves or pulleys is one, two, three, or four. A running block is attached to the object to be raised or moved; a standing block is fixed to some permanent support. Blocks also receive different denominations from their shape, purpose, and mode of application.

Block Books, before, and for a short time after, the invention of printing, books printed from wooden blocks, each the size of a page and having the matter to be reproduced, whether text or picture, cut in relief on the surface. These were intended for the popular use and were adorned with crude paintings, the makers of block books and card painters being the same till about the opening of the 15th century. As their work increased in favor they devised the process of block printing, cutting into

BLOCK COAL—BLOCKADE

wooden blocks or metal plates in such a manner as to leave letters and pictures in relief, and after applying color to these, taking impressions from them. One or both sides of the sheet were printed from these blocks. See also **PRINTING**.

Block Coal, the name of certain kinds of bituminous coal having a tendency to break into forms approaching the cube. See also **COAL**.

Block Island, an island in the Atlantic Ocean, midway between Montauk Point, L. I., and Point Judith, R. I.; eight miles long, and from two to five miles wide. It belongs to the State of Rhode Island, from the shore of which it is about 10 miles distant. It has become a noted summer resort, and constitutes the township of New Shoreham. Pop. (1900) 1,396.

Block Printing. See **PRINTING**.

Block System, a system of working the traffic on railroads according to which the line is divided into short sections, each section with a signal and telegraphic connection at the end. The essential principle of the system is that no train is allowed to enter upon any one section till that section is signalled wholly clear, so that between two successive trains there is not merely an interval of time, but also an interval of space. See **RAILWAY SIGNALS**.

Block Tin. See **TIN**.

Blockade is the rendering of intercourse with the seaports of an enemy unlawful on the part of neutrals, and it consists essentially in the presence of a sufficient naval force to make such intercourse difficult. It must be declared or made public, so that neutrals may have notice of it. If a blockade is instituted by a sufficient authority, and maintained by a sufficient force, a neutral is so far affected by it that an attempt to trade with the place invested subjects vessel and cargo to confiscation by the blockading power. The term is also used to describe the state of matters when hostile forces sit down around a place and keep possession of all the means of access to it, so as entirely to cut off its communication with the outside world, and so compel surrender from want of supplies.

To be sufficient, the blockade must be effective and made known. By the convention of the Baltic powers of 1780, and again in 1801, and by the ordinance of Congress of 1781, it is required that there should be a number of vessels stationed near enough to the port to make the entry apparently dangerous. The government of the United States has uniformly insisted that the blockade should be made effective by the presence of a competent force stationed and present at or near the entrance of the port. (1 Kent Com. 145.) But an accidental absence of the blockading force, or the circumstance of being blown off by the wind, if the suspension and reason of the suspension are known, will not be sufficient in law to remove a blockade. But negligence or remissness on the part of cruisers stationed to maintain the blockade may excuse persons, under certain circumstances, for violating the blockade. Taylor ('International Public Law,' p. 767), upon this subject, says:

"Under that rule the government of Great Britain naturally accepted the contention of that of the United States, made during the American Civil War,

to the effect that the legal efficiency of the blockade of Charleston,—usually maintained by one ship lying off the bar between the two principal channels, with two or three others cruising outside within signalling distance,—was not destroyed by the absence of the Niagara, a blockading vessel whose withdrawal, in the attempt to intercept a cargo of arms expected at another part of the coast, left the harbor open for at least five days. It was admitted, under the British rule, that there was no cessation of the Charleston blockade, despite the fact that a large number of vessels succeeded in passing it, owing to the peculiar nature of the coast. As there is no rule requiring the blockading squadron to remain within a certain distance of the place blockaded, provided access is really interdicted, Buenos Ayres was held to have been sufficiently blockaded by vessels stationed in the vicinity of Monte Video; and, in like manner, the blockade of Riga was maintained, during the Russian war in 1854, at a distance of one hundred and twenty miles from the town by a ship in the Lyser Ort, a channel three miles wide, forming the only navigable entrance to the gulf."

When on 21 Nov. 1806, the Berlin Decree of Napoleon I. declared the whole British Islands in a state of blockade, that blockade, being ludicrously ineffective, was illegal; so also, though to a somewhat less extent, were the British Orders in Council of 11 and 21 Nov. 1807, which placed France and all its tributary states in a state of blockade. The retaliatory Napoleonic Milan Decree of 27 Dec. 1807, extending the previously announced blockade to the British dominions in all quarters, labored to a still greater extent under the same defect. More effective, as being more limited in area, were the blockades of the Elbe by Great Britain in 1803, those of the Baltic by Denmark in 1848-9 and 1864, those of the ports of the Confederate States of America by President Lincoln on 19 April 1861, and that of the Cuban ports by the United States in 1898.

To involve a neutral in the consequences of violating the blockade, it is absolutely necessary that he have due notice of it. This communication may be communicated in two ways, either actually by a formal notice from the blockading power, or constructively, by notice to his government, or by the notoriety of the fact. Formal notice is not required; any authentic information is sufficient. Phillimore, 'International Law' (page 397); Taylor, 'International Public Law' (1901, p. 768). A violation may be either by going into the place blockaded, or by coming out of it with a cargo laden after the commencement of the blockade. For a master to place himself so near a blockaded port as to be in a condition to slip in without observation is a violation of the blockade, and raises the presumption of a criminal intent. The sailing for a blockaded port, knowing it to be blockaded, is, it seems, such an act as may charge the party with a breach of the blockade. (1 Kent Com. 150; 5 Cranch, 335.) By provision in the treaties between the United States and Greece, Prussia, and Sweden and Norway, it is agreed that vessels arriving at a port supposed at the time of departure to be blockaded shall not be captured and condemned for an attempt to enter, unless on proof that they had or could have learned of the continuance of the blockade, but an attempt to re-enter after warning will subject them to condemnation. Vessels in port before the establishment of the blockade are to be permitted to depart with their cargoes. They are usually allowed from 15 to 45 days in which to make their exit. Any one running a blockade does so at his peril; his government, by international law, cannot protect him from for-

BLOCKHOUSE — BLOEMFONTEIN

feiting his vessel with its cargo, and his liberty if he be captured by the blockading fleet. See INTERNATIONAL LAW; U. S., DIPLOMACY OF THE.

Blockhouse, in fortification, a house made of beams joined together crosswise, and often doubled, with a covering and loopholes, large enough for from 25 to 100 men. In addition to this, it is commonly covered with earth, to render it entirely bomb- and fire-proof. Forts of this kind are often fitted up to receive cannon. Blockhouses are generally built in the form of a square or a cross. Their use is to afford a feeble garrison of an important place, which is very much exposed, an opportunity of holding out against the cannonade and assault of the enemy till they are relieved. They also serve for bomb-proof guardhouses, and places of last resort, in the interior of intrenchments, and in the covered passages of fortresses, where the cannon are stationed. Blockhouses were much employed as a defense against Indians in America, by the French in Algeria, and by the Spanish in Cuba, where a line of blockhouses connected by wire barricades was built across the island in 1898.

Blocks of Five, a political expression in the United States, originating in the presidential campaign of 1888. A letter purporting to have been written by the treasurer of the Republican National Committee to the chairman of the Indiana State Committee, recommending securing "floaters in blocks of five." This was construed to mean the bribery of voters at wholesale rates. The Democratic managers circulated the letter as widely as possible, before election. Proceedings for libel were afterward begun, but never brought to trial.

Blocksberg, the name of several elevations in Germany, particularly the Brocken (q.v.), forming the summit of the Hartz Mountains and the highest point in the northern part of the empire.

Blodgett, Lorin, American statistician: b. near Jamestown, N. Y., 25 May 1823; d. Philadelphia, 24 March 1901. He was educated at Hobart College; appointed assistant professor at the Smithsonian Institution, Washington, D. C., in charge of researches on climatology, 1851; was employed on the Pacific Railroad survey for the War Department, 1852-6; and was engaged in the United States treasury department, 1863-77. He was also editor of the Philadelphia *North American*, and secretary of the board of trade of that city, 1858-64. He is credited with having laid the foundation of American climatology. His publications include 'The Climatology of the United States' (1857), a work that met high favor in the United States and Europe; 'Commercial and Financial Resources of the United States'; and about 150 volumes of reports.

Blodgett, Henry Williams, American jurist: b. Amherst, Mass., 21 July 1821; d. Waukegan, Ill., 9 Feb. 1905. He was educated at Amherst Academy; studied surveying and engineering; was admitted to the bar in 1844; and settled in Waukegan, Ill., to practise, in the following year. He served in the lower house of the legislature, 1852-4, and in the State Senate, 1859-65; and was United States district judge for the Northern District of Illinois, 1869-93, when he retired. He was ap-

pointed one of the counsel on the part of the United States before the arbitration tribunal on the Bering Sea fur-seal controversy between the United States and Great Britain, in 1892.

Blodgett, Samuel, American inventor: b. Woburn, Mass., 1 April 1724; d. Haverhill, Mass., 1 Sept. 1807. He took part in the French and Indian war; was a member of the expedition against Louisburg in 1745; and subsequently became a judge of the court of common pleas in Hillsboro County, N. H. He was the inventor of an apparatus by which he recovered a valuable cargo from a sunken ship near Plymouth, Mass., in 1783. His success led him to go to Europe for similar enterprises. He met with no encouragement in Spain, and in England proposed to raise the Royal George, which went down off Spithead with 800 persons on board, but his proposition was not accepted. In 1793 he began the construction of the canal around Amoskeag Falls in the Merrimac which now bears his name, but did not live to complete the work.

Bloede, blé'dé, Gertrude, American poet and novelist, better known as STUART STERNE: b. Dresden, Saxony, 10 Aug. 1845; d. Baldwin, L. I., 14 Aug. 1905. She wrote in verse ('Angelo' (new ed. 1879); 'Giorgio and Other Poems' (1881); 'Beyond the Shadow, and Other Poems' (1888); 'Piero da Castiglione'; and 'The Story of Two Lives,' a novel.

Bloemaert, bloo'märt, or Blom, Abraham, Dutch painter: b. Gorkum about 1565; d. Utrecht, 1647, or more probably 1657. His paintings are reproached with various faults, yet he is distinguished by the brilliancy of his coloring and the richness of his invention. He painted all sorts of objects, but his landscapes are the most esteemed. He had four sons, of whom Cornelis (b. Utrecht, 1603; d. Rome, 1680), was a distinguished engraver.

Bloemen, Jan Frans van, Flemish painter: b. Antwerp, 1662; d. Rome, 1748 (?). He was surnamed "Orizzonte," an allusion to the great beauty of the coloring he put into his landscapes.

Bloemen, Pieter van, Flemish painter, brother of Jan Frans: b. Antwerp, 1651; d. 1662. After study in Italy he was appointed dean of the Guild of St. Luke in his native city. His work is chiefly landscapes and military subjects. He is known as STANDAERT.

Bloemfontein, bloom'fün-tin, Orange River Colony, South Africa, the chief town and seat of government of the colony, 680 miles northeast of Cape Town, situated in an elevated and healthy region. It stands on a plain surrounded by low hills, and is regularly laid out, having a large market-square in the centre. It has several fine buildings, including the Anglican cathedral, the Dutch Reformed church, and other places of worship; the presidency; the town-hall; the post-office; the library; the national museum; the new Raadzaal, or council-chamber of the legislature; the old Raadzaal; Grey College and St. Andrew's College for boys; the Eunice Institute for girls; a government hospital and a cottage hospital; a lunatic asylum, etc. It is on the main railway line of the Colony, which is continuous with the Cape Colony and Transvaal systems. Pop. about 8,000, half being whites.

BLOIS — BLOMMAERT

In the war between Great Britain and the South African and Orange Free State republics in 1899-1900 it was the seat of important military operations. In June 1899, a conference was held here between President Kruger of the South African Republic, and Sir Alfred Milner, the British commissioner of Cape Colony, with a view of averting war. After the appointment of Lord Roberts to the supreme command of the British forces operating against the Boers, he led an expedition against the city and forced its surrender on 13 March 1900, President Steyn escaping capture. Soon afterward the part of the republic occupied by the British was formally placed under British administration.

Blois, blwā (anciently BLESUM), France, the capital of the department Loir-et-Cher, 99 miles south-southwest of Paris, situated on the right bank of the Loire, from which it rises in the form of an amphitheatre. It consists of an upper town, with very narrow and crooked streets; a lower town, with many handsome houses, extending along a handsome quay; and of several suburbs, with one of which it communicates by a stone bridge of 11 arches. The city is furnished with spring water through an old Roman aqueduct, in excellent preservation. Thierry, the historian, was born here. The castle of Blois is rich in historical associations. It was long occupied by the counts of the name, and became a favorite residence of the kings of France. Louis XII. was born, Francis I., Henry II., Charles IX., and Henry III. held their courts in it; and the Guises, by a cruel though not unjust retribution, were murdered in it. When Maria de' Medici was, in 1617, exiled from the court, she resided, probably as a prisoner, in this castle, whence, 18 months later, she escaped through a high window, which is also an object of curiosity. In 1814, on the approach of the European armies to Paris, the Empress Maria Louisa and the council of regency repaired for a while to this place. Afterward the castle was entirely neglected, and even used as barracks for cavalry. During the later years of Louis Philippe's reign, this curious specimen of architecture was carefully and tastefully restored. Blois has several literary and scientific societies, a botanical garden founded by Henry IV., a public library with 19,000 volumes, a departmental college, and a diocesan seminary. It trades in wines, spirits, vinegar, staves, and licorice, while it produces serges, hosiery and gloves, cutlery and hardware. Pop. (1896) 23,542.

Blok, Petrus Johannes, pā-troos yō-hān-ēs, Dutch historian: b. Helder, 1855. He was educated at Leyden; in 1884 became professor of history at Croningen and later at the University of Leyden. He was also Queen Wilhelmina's tutor in history. His work has been chiefly in social-political history of the Netherlands. He is the author of 'History of the People of the Netherlands' (translated into English); 'Eene Hollandsche stad in de Middeleeuwen' and 'Eene Hollandsche stad onder de Bourgondisch-Oostenrijksche Heerschappij.'

Blomfield, Charles James, English divine: b. Bury-St.-Edmunds, Suffolk, 1786; d. Ful-

ham, 5 Aug. 1857. He studied for the church at Cambridge, where he took high honors; and after filling several curacies, and acting for a time as chaplain to the bishop of London, was presented to the rectory of St. Botolph, Bishopsgate. In 1824 he was made bishop of Chester, and in 1828 bishop of London. He acquired considerable renown as a classical scholar from the editions published by him of several of the dramas of Æschylus, and he also published an edition of Callimachus, which is much esteemed. Along with Rennel, he edited, in 1812, the 'Musæ Cantabrigienses,' and in 1814, along with Monk, the 'Posthumous Tracts' of Porson, followed two years afterward by the 'Adversaria Porsoni.' In his ecclesiastical capacity he displayed great zeal and energy, more churches having been built in London under his episcopate than under that of any bishop since the Reformation. He incurred, however, some animadversions on his proceedings in relation to the Tractarian controversy by a vacillating policy, which gave satisfaction to neither of the parties.

Blomfield, Edward Valentine, English clergyman (brother of the preceding): b. 1788; d. October 1816. He studied at Caius College, Cambridge, and excited the highest expectations. Among several prizes which he gained was a medal assigned him in 1809 for his beautiful ode 'In Desiderium Porsoni.' In 1812 a fellowship in Emmanuel College was conferred on him. In 1813 he visited Germany, where he acquired a good knowledge of the German language, and became acquainted with Wolf in Berlin, and Schneider in Breslau. After his return he wrote in the 'Museum Criticum,' or 'Cambridge Classical Researches,' remarks on German literature which were received with approbation. The University of Cambridge appointed him one of the preachers of St. Mary's Church. He began a translation of Schneider's 'Griechisch-Deutsches Lexicon,' but did not live to finish it. Matthiæ's 'Griechische Grammatik,' however, he translated completely. His translation was published by his brother and was everywhere well received. He was in Switzerland in 1816 with his pupil, a young nobleman, and in his haste to return to Cambridge on hearing that he was appointed proctor for the following year, the fatigue of rapid traveling occasioned a sickness of which he died.

Blomfield, Reginald, English architect: b. 20 Dec. 1856. He was educated at Exeter College, Oxford. He is architect to the Army and Navy Society and among his many important professional works are 'Brocklesby Park,' 'Caythorpe Court,' 'Hollbrook House,' 'New Buildings at Haileybury College,' 'Lady Margaret Hall,' 'Portsea Institute.' He has published 'The Formal Garden in England' (1892); 'A History of Renaissance Architecture in England' two works of great value (1897); 'Short History of Renaissance Architecture in England' (1900).

Blommaert, blōm-mārt, Philip, Flemish philologist: b. Ghent about 1809. He has done much for the literature of his country

by an edition of the old Flemish poets of the 11th, 12th, 13th, and 14th centuries, with glossaries, notes, and emendations. He has also republished the 'Nibelungenlied,' translated into Dutch iambics. His best work, however, is the 'Aloude geschiedenis der Belgen of Nederduitschers,' in which he vindicates the claims of his country to an independent national existence and national literature. Blommaert also writes French well, and is a contributor to the 'Messager des Sciences Historiques.'

Blommaert, Samuel, Colonial patroon: b. 1590; d. 1670. He bought a tract of land almost equal in size to the present State of Delaware, extending from Cape Henlopen to the mouth of the Delaware River. The deed for this land given him by Peter Minuit, and his Council is the oldest deed for land in Delaware. He formed a company to provide for the settlement of this land, and a colony was started, but destroyed by the Indians after a few years in revenge for an act of the governor, Gillis Hosset.

Blond, Jacques Christophe le, zhäk kris-tof lê blondt, printer of engravings: b. Frankfort-on-the-Main, 1670; d. Paris, 1741. He was bred a painter, and in 1711 went to Amsterdam, and some years after to England. He conceived the idea of an establishment to print engravings in colors, and, obtaining means, produced many copies of engravings and pictures, which of course had defects, and the experiment failed. He now devoted himself to producing the cartoons of Raphael in tapestry, but this failed also, and he soon after died.

Blon'del, a confidential servant and instructor in music of Richard Cœur de Lion of England, about the year 1190. While his master was the prisoner of the Duke of Austria, Blondel went through Palestine and all parts of Germany in search of him. He understood, it is said, that a prisoner of rank was confined in Löwenstein Castle, and hastened hither. Placing himself under a grated tower, he began to sing one of the French lays which he had formerly composed for Richard. Scarcely had he finished the first stanza when a voice from the dungeon of the tower responded. Thus he discovered his king, delivered him, and gained the name of the 'faithful Blondel.' Grétry's fine opera, 'Richard Cœur de Lion,' is founded on this anecdote.

Blondin, Charles Emile Gravelet, shärt ä-mël gräv-lä blön-dän, French acrobat: b. St. Omer, Pas-de-Calais, 1824; d. London, 22 Feb. 1897. He was trained at Lyons, where he made such rapid progress that he was designated 'The Little Wonder.' After making a several years' tour of the United States, on 30 June 1859, before a crowd of 25,000 persons, he crossed the Falls of Niagara on a tight-rope in five minutes; on 4 July he crossed blindfold, trundling a wheelbarrow; on 19 August he carried a man on his back; on 14 Sept. 1860 he crossed on stilts in the presence of the Prince of Wales. His engagement at the Crystal Palace in 1862, where he performed on a rope 249 yards long, and 170 feet from the ground, drew immense

crowds. After several years' retirement he reappeared in 1880, and in 1888 again performed in London, where he died.

Blood, Thomas (commonly called COLONEL BLOOD): b. Ireland, 1618; d. 1680; was a disbanded officer of Oliver Cromwell, and a man distinguished in various audacious enterprises. He made an attempt to steal the crown and regalia from the tower, in which he almost succeeded. Being, however, taken, he confessed his purpose without showing the least fear of death. Charles II. from idle curiosity, went to see him, and Blood persuaded the monarch to pardon him. Charles even bestowed an estate with \$2,500 a year upon him, while poor Edwards, the keeper of the jewel-office, who valiantly defended the crown and was wounded, lived forgotten.

Blood, the yellowish to reddish liquid alkaline medium present in the arteries and veins, the chief tissue of oxidation in the animal body. The composition and character of the blood varies very widely in different animals, and hence this description is confined more particularly to the human blood. From the standpoint of cell-structure the blood is a tissue made up of a liquid plasma and solid cells or corpuscles. It contains at least four separate and important ingredients, the plasma, or blood serum; red cells, or erythrocytes; white cells, or leucocytes; and blood plates. About one tenth to one twelfth of the entire body is blood, of which nine tenths is water.

Plasma.—The greater portion (56 per cent) of the blood is plasma. This plasma is composed of 90 per cent water containing gases, mineral salts, fats, nitrogenous bodies, and carbohydrates in solution. It is a clear yellowish fluid. The mineral salts are sodium chloride, common salt, the most abundant; sodium carbonate, which renders the blood alkaline; potassium chloride, potassium sulphate, calcium phosphate, sodium phosphate, magnesium phosphate, and calcium chloride. Traces of other inorganic salts are frequently found. The gases in the blood plasma are oxygen, nitrogen, and carbon dioxide. Of the organic constituents the non-nitrogenous ones are the fats and carbohydrates, with small amounts of fatty coloring matters, lipochromes, cholesterin, and sarcolactic acid. The fats are present in variable quantities, being particularly abundant following a meal. They are the glycerides of stearic, oleic, and palmitic acids. The carbohydrates are at least three, glycogen, dextrose or grape sugar, and animal gums. The non-proteid nitrogenous constituents of the plasma consist largely of the waste extractives. The most important of these are urea, kreatin, kreatinin, uric acid, and hippuric acid. Three ferments or enzymes are thought to be present in the plasma—a diastatic ferment, converting starches into sugars; a glycolytic enzyme, breaking up sugar, and a lipase, or fat-splitting enzyme. In addition, there is the ferment that causes coagulation. Whether this is present in the serum or in the white cells is a matter of inquiry. The proteids of the plasma are serum albumins, globulins (serum globulin and fibrinogen), and nucleo-proteids.

BLOOD—BLOOD FEUD

Red Cells.—These are the most abundant of the formed elements of the blood, making up 99 per cent of the corpuscles. There are thought to be in man at least 5,000,000 red blood-cells to every cubic millimetre of blood; their size, therefore, is very small, averaging in man 7.8 m.m.m. They are flattened circular disks, with double depressed centres, one fourth as thick as broad. In the embryo and in certain diseased states the red blood-cells have a nucleus, but the normal red blood-cell in man has lost this cell-structure. Practically all of the mammals, save the camel tribe, have circular red blood-cells; the camels and most of the lower animals have oval red blood-cells; in the lower animals they are mostly nucleated. There is also great variation in size in the red cells of the various animals, being largest among the *amphibia* (*Amphiuma* 75 m.m.m.). The red blood-cells are mostly manufactured in the marrow of the long bones. The chemical structure of the red cells is complex, but they contain an iron compound, hemoglobin, which is the most important constituent of the blood in the process of respiration and oxidation; by it the complex processes of chemical interchange in the body (metabolism) are made possible. Poisoning of the hemoglobin and the loss of its function means death by asphyxia. The hemoglobin gives the reddish-yellow tinge to the blood, and the differences in shade between venous blood and arterial blood are due to the state of oxidation of the hemoglobin.

White Cells.—Leucocytes.—These are much less numerous than the red cells, varying in number from 5,000 to 20,000 to the cubic millimetre. At least five different forms of white cells are normally present in human blood. These are large and small lymphocytes, polymorpho-nuclear neutrophiles, eosinophiles, and transitional forms. Mast cells are another form of varying occurrence. The polymorph neutrophiles are the most numerous of the leucocytes and make up the greater mass in pus-cells. In shape and size these white cells differ, but all are spherical, some smaller than the red cells (6.7 m.m.m.), but mostly larger (about 10 m.m.m.), and all have one or more nuclei. The leucocytes are formed in a number of lymphatic tissues, the hæmolymp glands, the spleen, etc., and are among the most interesting of the constituents of the blood, since one of their chief functions is to protect the body from disease-producing micro-organisms. They may be aptly termed the human body's "army of the interior" in the fight with disease-causing agents. They are useful both physically (by eating, as it were, the bodies of invading bacteria—phagocytosis, q.v.) or chemically (in the elaborating of certain counter-poisons—antitoxins, q.v.), or in the manufacture of specific immunizing bodies for the blood-serum (see IMMUNITY). Their careful study in diseased conditions is very helpful in arriving at a diagnosis of the disease process.

Blood Plates.—These are of frequent occurrence, but as yet little is known of their function. They are thought to be globulin-like in their nature, and of use in the phenomenon of coagulation; others claim them

as nucleo-proteids, made from the white blood-cells.

Functions of the Blood.—These, as already indicated, are numerous. Through the hæmoglobin, blood is the great oxidizing medium. It carries products for anabolism and products of katabolism, and is the great equalizer, by arterial pressure, of the osmotic pressures of all the cells of the body. As a means of defense in the struggle with parasitic invaders the blood is the most important of the body's bulwarks. See BLOOD DISEASES.

(Consult Ewing, 'Clinical Pathology of the Blood' (1902), with a most exhaustive bibliography on all blood subjects. For physiology see Schäfer, 'Physiology,' Vol. I., 1898.)

Blood, Avenger of, in Scripture, the nearest relation of any one that had died by manslaughter or murder, so called because it fell to him to punish the person who was guilty of the deed. In the political law of Israel the practice of punishment by the nearest relative, which had always been prevalent, was allowed to continue, while rules were laid down to prevent the chief abuses connected with it. The distinction was sharply drawn between murder and manslaughter. For the former no ransom or satisfaction was permitted. In the case of the latter, however, there were six cities set apart out of the number which the Levites occupied, placed at suitable distances over the extent of the land, three on each side of the Jordan, with roads leading to them which were well kept up, and these were cities of refuge to which the manslayer might flee, and within which he might dwell in safety without fear of the avenger. But he was not permitted to return to his own place; in fact, he had no safety, if he left his place of refuge, until the death of the high-priest during whose term of office his misfortune had occurred. See CITIES OF REFUGE.

Blood Clam, or Blood Quohog, a local name given in Narragansett Bay to *Arca* or *Scapharca, transversa*, a common bivalve ranging from Narragansett Bay to Georgia, in reference to the reddish spots on the inside of the edge of the shell, and to the reddish flesh-color of the ovaries. It is not used as an article of food.

Blood, Council of, the name popularly applied to the Council of Troubles, established by the Duke of Alva, in the Netherlands, in 1567. Although it had no charter or authority from any source, it was omnipotent and superseded all other authorities. In the first three months alone its victims numbered 1,800, and soon there was hardly a Protestant house in the Netherlands that had not furnished a victim.

Blood Diseases. Many disorders are classed under this head. See ANÆMIA; BLEEDING; CHLOROSIS; CIRCULATION; HÆMOPHILIA; LEUCÆMIA; PERNICIOUS ANÆMIA.

Blood Feud, the right of individual, or family, vengeance in cases of bloodshed. In a very primitive state of society the tendency toward private instrumentality in the punishment of crime is largely unchecked. In passing from this stage to the highly organized system of legal penalties enforced by modern

BLOOD.—THE GENERAL DISTRIBUTION OF THE BLOOD VESSELS.

Arteries are shown in red, the veins in blue.

H, the heart. l, left side r, right side. Arising from the heart is the main artery Aorta (A). The letter is put on the vessel at some distance from the heart, near where it gives off the branches (in red) for the head and arms, and at the point where it arches backwards and downwards to pass through the chest and the belly till at A, it gives off branches for the legs. Running alongside the arteries are represented in blue, veins At K, is represented the position of the kidneys and their veins. L, represents veins of the lung. J, jugular vein. Ch. outlines of the chest.

BLOOD-FLOWER—BLOOD-RAIN

civilized governments, the regulation of the blood feud was a marked step in the advancement of the race. It is true that the right of private vengeance was recognized, but it was put under restrictions and gradually narrowed in its action. The slayer had the right of sanctuary, illustrated by the cities of refuge in Israel under the Mosaic economy, by the altars of pagan deities and by the churches of the Middle Ages. The danger of dragging entire clans into retributive warfare to avenge a single murder was averted by limiting the right of vengeance to the immediate family, or the next of kin to the one slain, and the privilege of purchasing exemption by the wergild tended to check a blood penalty. The acceptance of the blood-money was finally made obligatory. The amount of the fine imposed upon the murderer varied among the Anglo-Saxons according to the rank of the victim. The family feuds among the mountain whites in certain sections of the United States form an interesting modern instance of the survival of the primitive institution of blood feud. See ASYLUM, RIGHT OF.

Blood-flower, or Blood-lily, a genus (*Hemeranthus*) of about 60 species of summer- and autumn-blooming bulbous-rooted plants of the natural order *Amaryllidaceae*, natives mostly of South Africa, named from the general color of their flowers, which are arranged in umbels arising on an often beautifully colored scape either before the foliage or from a rosette of radical leaves. The few species cultivated in American greenhouses have not become widely popular, but are worthy of more extended culture, since the individual flowers are often two inches in diameter and the umbel sometimes a foot across. They may be cultivated like the nerine. Since some of the most attractive species reproduce slowly, the bulbs are often cut in two horizontally and treated like hyacinth bulbs similarly cut. Several new bulbs form around the margin of the cut halves. Consult Bailey and Mitler, 'Cyclopedia of American Horticulture' (1900-2).

Blood Indians, or Kino Indians, a tribe of North American Indians of the Siksika Confederacy, dwelling in the Northwest Territories of Canada.

Blood-letting. See BLEEDING.

Blood-lily. See BLOOD-FLOWER.

Blood-money, money paid to the next of kin of a man who met with his death at the hands of another, accidentally or with premeditation. The Greeks called it *ποινὴ*, the Latins *pæna*, the Franks, Allemanni, and Scandinavians *manbot*, *wehrgeld*, or *wyrgilt*, the British Celts named it *saarhard*, and the Irish Celts *eric*. The institution still flourishes in many communities of Asia and Africa. In English criminal law the term blood-money was also applied to rewards paid to informers against highway robbers, thieves, burglars, and utterers of false coin or forged bank-notes. Laws empowering such payments were passed between 1692 and 1742. In 1813 the total amount paid in this way was £18,000. By this time a number of persons made a living out of these laws by entrapping unwary and foolish people into the commission of the

crime of forging or uttering false coin, and then informing against them. As early as 1756 one McDaniel had brought to the scaffold and earned the blood-money of no less than 70 victims. Parliament, recognizing the abuses the system had engendered, repealed all the laws relating thereto, except in relation to the forgers of bank-bills, in which case the informer can still get his pecuniary reward.

Blood-pheasant, one of the small quail-like pheasants of the Himalayan genus *Ithaginis*, whose throat and breast are blood-red.

Blood-poisoning. From the standpoint of bacteriology blood-poisoning may be of two distinct types: It may be due to the presence of the poisonous toxins taken up by the blood, in which case it is called bacteræmia or sapræmia, sometimes septicæmia; or it may result from the toxins plus the micro-organisms in the blood itself, a true blood infection, in which case it is termed, septicæmia, or pyæmia. The bacteria most frequently found in the blood in cases of septicæmia or pyæmia are the *Streptococcus pyogenes aureus*, *Staphylococcus pyogenes aureus*, *Diplococcus lanceolatus*, in pneumonia, *Bacillus typhosus*, in typhoid, and occasionally others. See PYÆMIA.

Blood Pressure. The pressure of the circulating blood varies very markedly in the three great divisions of the vascular system, the arteries, capillaries and veins, being lowest in the latter, highest in the arteries, and intermediate in the capillaries. The arterial pressure is the most important from the practical standpoint of the physician, and depends on four factors: the strength of the heart's pulsations, the degree of peripheral resistance, the elasticity of the arterial wall, and the volume of the circulating blood. Although subject to not inconsiderable fluctuations, the arterial pressure during health is fairly constant, and in disease its study is of great importance, both for purposes of diagnosis and of treatment. In a general way its variations may be estimated by feeling the pulse and judging the pressure by the resistance of the artery to the fingers, but it has been found of value to make more accurate observations by means of special instruments, or sphygmomanometers. Numerous forms of these are in use, among the newer ones being Gärtner's tonometer, and the various modifications of the Riva-Rocci instrument devised by Cook, Stanton, and Janeway. Elevations of arterial tension are commonly observed in certain diseases of the heart, arteries, and kidneys; while the pressure is low in wasting diseases, after severe hemorrhage or grave injuries, and with impending death. The blood pressure may also be raised or lowered by the administration of appropriate drugs. (See CIRCULATION.) Consult Janeway, 'The Clinical Study of Blood Pressure' (New York 1904).

Blood-rain, showers of grayish and reddish dust mingled with rain, which occasionally fall, usually in the zone of the earth which extends on both sides of the Mediterranean westwardly over the Atlantic and eastwardly to Central Asia; the red color being due to the presence of a red oxide of iron.

BLOOD-STAINS—BLOODY SHIRT

Blood-stains, in medico-legal investigations, are subjects of some importance, particularly when murder is suspected and so-called blood-stains are to be investigated. The first question to be determined is whether the suspected stain is blood of any animal; secondly, is it human blood or that of a lower animal. To determine the first question certain tests have been devised. These are (1) the guaiac test, by which blood brought in contact with tincture of guaiac and hydrogen peroxide develops a blue color (not, however, conclusive); (2) the hæmin test, by which crystals are produced from the hæmoglobin and identified under the microscope; (3) the spectroscopic test, which gives a spectrum of hæmoglobin; (4) the microscope test, by which the blood-corpuscles are identified. To answer the second question requires either (1) the microscopical examination that determines the size, shape, and qualities of the blood-corpuscles; or (2) a much more reliable serum test, by which human serum, if brought in contact with the blood of an alien animal, causes dissolution of the blood-corpuscles of that animal's blood. By this serum test it is possible to detect any blood of any animal.

Blood-transfusion. See INFUSION; TRANSFUSION.

Blood-vessels. See ARTERIES; CAPILLARIES; HEART-VEINS.

Blood of Our Saviour, an order of knighthood, known also as the Order of Our Redeemer, and the Precious Blood of Jesus Christ. It was instituted in Mantua, Italy, in 1608, by Duke Vincenzo Gonzaga, and consisted of 20 members. Upon the collar was the legend *Domine probasti me*, and on the pendant, *Nihil isto triste recepto*.

Bloodbird, a black honey-eater of southern Australia, whose head, neck, breast, and back (of the male) are scarlet red.

Bloodhound, a dog of the "hound" build, commonly used for tracking fugitives. It usually stands from 25 to 27 inches high at the shoulders and weighs about 90 pounds. In appearance it is of a sedately noble expression, with a wise-looking, wrinkled face. Its color is black, mingled with a rich tan on the legs; a few are all tan. Its coat is short and glossy; the ears large and pendant; and the eyes deeply sunken, and showing a third lid or "haw." It has a somewhat loose skin for so muscular a dog, and quite a dewlap in front of the throat. It has a wonderful power of scent, by means of which, aided by judicious training, it is enabled to follow the footsteps of a particular man, though they may be crossed and recrossed a thousand times by other footsteps, and though they lead over bare pavements.

The true bloodhound suffers from an unfortunate name, which seems to suggest bloodthirstiness, a quality very far removed from his real disposition. The term "bloodhound" originally meant simply that the dog was thoroughbred in the same sense that a horse or other animal is of "blood" or "blooded" stock. In the early days the Spaniards introduced into Cuba and South America dogs which had some of the character-

istics of the bloodhound, but were really a cross between the ferocious war-dog of the ancients and the big Spanish pointer. These dogs had evil dispositions and were capable of great ferocity, and their sins have been visited on the real but innocent bloodhound. The true bloodhound will trail a man to the last of its strength, but will not voluntarily attack him. When it has located him, it will keep guard and prevent his escape; and may, if attacked, use its great powers in self-defense, but not in the savage manner generally attributed to it; it is not in its nature to be cruel.

Bloodroot. See SANGUINARIA.

Blood'stone. See HELIOTROPE; HEMATITE.

Bloodworm, the larvæ of species of *Chironomus*, gnats allied to the mosquito. The worms live in fresh-water pools and sluggish streams. They are long, slender, and worm-like, and certain species are blood-red in color. The flies have very feathery antennæ and do not bite. The larvæ usually have no tracheæ. The red color of these larvæ is due to hæmoglobin, a substance that has the power of attracting and storing oxygen, and giving it off to the tissues as they require it. Such larvæ are able to live in burrows which they construct in the mud. Some of them, provided plentifully with hæmoglobin, are in consequence able to live at great depths (it is said even at 1,000 feet in Lake Superior), and come to the surface only occasionally. A few are able even to tolerate salt water, and have been fished up from considerable depths in the sea. It is a remarkable fact that these physiological capacities differ greatly within the limits of the one genus, *Chironomus*, for some of these species are destitute of hæmoglobin, and have to live near the surface of the water; in these there is a well-developed tracheal system.

Bloodwort. See SANGUINARIA.

Bloody Assizes, the name given by the people to a series of trials held in England by the infamous Judge Jeffreys, in 1685, after the suppression of the Duke of Monmouth's rebellion. Upward of 300 persons were executed after short trials; very many were whipped, imprisoned, and fined; and nearly 1,000 were sent as slaves to the American plantations. See JEFFREYS, GEORGE.

Bloody Bill, in American politics, an act sometimes called the FORCE BILL, passed by Congress 2 March 1833. Its aim was to enforce the tariff-law of 1832, which the legislature of South Carolina had declared null and void. See U. S., TARIFF IN THE.

Bloody Falls, the lowest cataract of the Coppermine River in the Northwest Territories of Canada; so named because of a massacre here of Eskimos by Chippewa Indians in 1770.

Bloody Mary, a popular designation of Mary, Queen of England, on account of the persecutions of the Protestants during her reign (1553-8).

Bloody Shirt, a term used about 1880 in Congress, to revive the memories of the Civil War by impassioned allusions as, "to wave the bloody shirt."

BLOODY TOWER—BLOOMFIELD-ZEISLER

Bloody Tower, a term popularly applied to that portion of the Tower of London in which Richard III. is alleged to have caused the murder of his nephews, Edward V. and the Duke of York.

Bloom, the powdery or waxy protective film upon fruits, as grape and plum; and upon leaves and stems, as cabbage. It is especially noticeable upon desert plants. See also XEROPHYTES.

Bloom, a lump of puddled iron, which leaves the furnace in a rough state, to be subsequently rolled into bars or other form into which it may be desired to convert the metal. Also a lump of iron made directly from the ore by a furnace called a bloomery. See also IRON.

Bloomer, Amelia Jenks, American reformer; b. Homer, N. Y., 27 May 1818; d. Council Bluffs, 30 Dec. 1894. She was married in 1840 to Dexter C. Bloomer, of Seneca Falls, N. Y., where for several years she and her husband were engaged in publishing a semi-monthly periodical. In 1849 she began publishing 'The Lily' in the interests of temperance reform and women's rights; in 1853, on removing to Mount Vernon, Ohio, she resumed its publication there, and also became associate editor of 'The Western Home Journal.' In 1855 the couple removed to Council Bluffs, Iowa, where Mr. Bloomer became an organizer of the Republican party in that State, and a Federal official and a judge. She carried on her reformatory work for many years. Mrs. Bloomer will be remembered longest because of her personal adoption and her active advocacy of a costume which had been devised by Mrs. Elizabeth Smith Miller, and which became more popularly known as the Bloomer costume. (q.v.)

Bloomer Costume, a style of dress introduced about the year 1849 by Mrs. Amelia Jenks Bloomer (q.v.), who proposed thereby to effect a complete revolution in female dress and add materially to the health and comfort of her sex. It consisted of a jacket with close sleeves, a skirt reaching a little below the knee, and a pair of Turkish pantaloons secured by bands around the ankles. Though adopted rather extensively in America, it was unable to hold its ground against the united strength of prejudice and ridicule, and abroad it scarcely made further way than furnishing a favorite subject of burlesque on the stage, and of ridicule in the pages of the comic papers. One or two "strong-minded" women who ventured to brave public opinion in London by donning the new costume, were persecuted by the mob.

Bloomfield, Joseph, American soldier; b. Woodbridge, N. J.; d. Burlington, N. Y., 3 Oct. 1823. When the Revolutionary War broke out he was studying law, but joined the cause of the colonists with enthusiasm. In 1776 he received a captain's commission in the 3d New Jersey regiment, served with distinction throughout the war, and was mustered out a major. Resuming his legal studies, he acquired a successful practice in Burlington, was elected attorney-general, and twice (1801, 1812) governor of the State. During the War of 1812 he commanded a brigade. From 1817 to 1821 he was a representa-

tive in Congress, and as chairman of the Committee on Revolutionary Pensions he reported the bill granting pensions to soldiers of the Revolutionary army. In 1793 he was appointed a trustee of Princeton, and during his eight years' membership of the board, did much to promote the interests of that college.

Bloomfield, Maurice, American educator; b. Bielitz, Austria, 23 Feb. 1855. He came to the United States in 1857; entered the University of Chicago, and was graduated at Furman University, in Greenville, S. C., in 1877; took a course in Sanskrit and comparative philology in Yale College 1877-8; and was a Fellow of Johns Hopkins University 1878-9. He continued his studies in Berlin and Leipsic 1879-81; became an associate in Johns Hopkins University in 1881; and subsequently professor of Sanskrit and comparative philology there. He published numerous grammatical and philological papers; edited for the first time from the original Sanskrit MSS. the 'Sutra of Kauçika'; translated the 'Atharva-Veda' in the 'Sacred Books of the East'; and has since been engaged in compiling a 'Concordance of the Vedas.'

Bloomfield, Robert, English poet; b. Honington, 1766; d. August 1823. He learned to read at the village school, and in 1781 was sent to learn the trade of a shoemaker with his brother in London. The visiting of several places of worship, a debating society, Covent Garden Theatre, and the reading of sundry books, called forth his faculties, and he became almost unconsciously a poet. Hearing him one day repeat a song which he had composed, his astonished brother prevailed on him to offer it to the 'London Magazine,' and it was accepted. The piece was called 'The Milkmaid.' A second, 'The Sailor's Return,' likewise found a place in that journal. Thomson's 'Seasons,' 'Paradise Lost,' and other works of this kind, now became the subjects of his constant study. In the country, where he resided for a short time in 1786, he first conceived the idea of his poem, 'The Farmer's Boy,' which is characterized by a spirit of rural simplicity and innocence. It was written under the most unfavorable circumstances, in a garret. It was first shown to Capel Lofft in 1798, who was so much pleased with it that, in conjunction with his friend Hill, he had it printed in 1800. Bloomfield was patronized by the Duke of Grafton, who bestowed on him a small annuity and made him an under-sealer in the seal-office. This situation he was forced to resign on account of ill health. He then worked again at his trade as a shoemaker, and employed himself in constructing Æolian harps. Engaging in the book trade he became a bankrupt, and in the latter part of his life was afflicted with violent headaches and became nearly blind. He was gradually reduced to such a state of nervous irritability that apprehensions were entertained of his becoming insane. These fears were terminated by his death.

Bloomfield-Zeisler, Fanny, American pianist; b. Bielitz, Austrian Silesia, 16 July 1866. She came to Chicago with her parents in her second year, and at an early age displayed marked musical talent, which was later developed by study abroad, chiefly under Leschetizky at Vienna. Since 1895 she has played regularly in the principal cities of the United States. In

BLOOMFIELD—BLOUNT

1893-5 she made a tour of the chief cities in Germany, everywhere meeting with great applause. In the spring of 1898 she made a successful English tour.

Bloomfield, N. J., a township in Essex County, on the Delaware, L. & W., and the Erie R.R.'s, the Morris Canal, and trolley lines connecting with Newark, the Oranges, Jersey City, and other cities; 10 miles northwest of New York. It was founded in 1685, under the name of Watsessing, and received its present name from Gen. Joseph Bloomfield in 1796. The oldest church in the town dates from this year. Bloomfield once ranked as an educational centre. Here were located in addition to other similar institutions, the Bloomfield Classical School, Madam Cooke's Female Seminary, and a Presbyterian Theological Seminary, the edifice of the latter being now occupied by a German theological seminary. It has a fine Mountainside Hospital; contains the residences of many New York business men; and is engaged in the manufacture of church and cabinet organs, woolen goods, hats, shoes, rubber goods, tissue and photographic paper, saddlery, hardware, electric elevators, and a variety of brass goods. It has a national bank, daily and weekly newspapers, an assessed property valuation of nearly \$4,000,000 and a total debt of about \$250,000. Pop. (1900) 9,668.

Bloomington, Ill., city and county-seat of McLean County, situated near the geographical centre of the state, 126 miles south of Chicago and on the Illinois Central, Chicago & Alton, Big Four, and Lake Erie & Western R.R.'s.

Manufactures and Industries.—Bloomington is in the heart of the famous Illinois corn belt, surrounded by one of the richest and most productive agricultural sections in the world, and where the largest nurseries in the state, comprising over 1,000 acres, are located. It is engaged in the manufacture of farm implements, flour and feed, stoves and furnaces, brick and tile, canned goods, harness, store fixtures, and portable elevators; has a coal shaft lifting 700 tons of coal per day, a bevel glass plant, ornamental iron works, paper and cigar factories, a brewery and a pork-packing establishment.

Banks.—There are seven banks—three national and four state—with a combined capital and surplus of \$1,700,000, and deposits of \$5,000,000.

Parks.—The city has three beautiful parks and is noted for its fine brick pavements, having more than any other city of its size.

Churches, Educational Institutions, Etc.—There are 32 churches of all denominations, a fine public school system, with a high school, 12 grammar schools, 3 parochial schools and several excellent private schools; a commercial college, a college of oratory and one of music. Bloomington has one of the largest and best selected public libraries in the state and several law libraries. The Illinois Wesleyan University (q.v.) and the Soldier's Orphan Home are located here, and the Illinois State Normal University (q.v.), which has long been known as one of the best institutions in the Union for the education of teachers, is situated at Normal, a suburb about two miles distant from the courthouse, and connected by electric railway. Among the public buildings are a large courthouse, two opera-houses, and several commodious public halls.

History, Government, Etc.—The city was first settled by pioneers from New England and Kentucky and became a borough in 1831 and was incorporated in 1851. The government is vested in a mayor and board of aldermen, composed of 14 members, who are elected biennially. The city has an electric railway system, operating over 20 miles of track, and a well-trained fire department; is lighted by gas and electricity and controls its water-works. Pop. (1905) 28,286.

ADLAI E. STEVENSON.

Bloomington, Ind., city and county-seat of Monroe County, on the Monon and the Indianapolis Southern R.R.'s; 60 miles south of Indianapolis. It is in a limestone and quarry region; is the seat of the Indiana State University (q.v.); and besides its farming and quarrying interests has important manufacturing concerns, especially in the lines of leather and hardware. The city has the Monroe County Library, a national bank, several daily and weekly periodicals, and a property valuation of over \$1,500,000. It was settled in 1818 and was incorporated as a city in 1876. Pop. (1900) 6,460.

Bloomsburg, Pa., a town and county-seat of Columbia Co.; on the Susquehanna River, the Pennsylvania Canal, and several railroads; 40 miles west of Wilkesbarre. It is in an iron and limestone region; contains a number of iron furnaces and foundries, silk mills, brass and copper tube works, furniture and desk factories, carpet factories, etc.; is the seat of the State Normal School and a literary institute, and has an assessed property valuation of about \$2,500,000. Pop. (1900) 6,170.

Blouet, Paul, pôl bloo-ä (MAX O'RELL), French lecturer and author; b. Brittany, France, 2 March 1848; d. Paris, 24 May 1903. In early life he was an officer in the French army, but in 1873 went to England and became a teacher. After the publication of his first book, 'John Bull and His Island' (1883), he abandoned teaching and devoted himself to literature. His works include 'John Bull and His Daughters' (1884); 'Jonathan and His Continent' (1888, with Jack Allyn); 'A Frenchman in America' (1891); 'John Bull & Co.' (1894).

Bloundelle-Burton, John Edward, English novelist; b. 3 March 1850. He was educated for the army, has lived and traveled in the United States and many European countries and has been a correspondent of various English and French journals. His published works include: 'The Silent Shore' (1886); 'His Own Enemy' (1887); 'Across the Salt Seas' (1898); 'The Scourge of God' (1898); 'Fortune's My Foe' (1899); 'A Bitter Heritage' (1899); 'The Seafarers'; 'Servants of Sin' (1900); 'A Vanished Rival' (1901); 'The Year One' (1901); 'The Fate of Valsee' (1902).

Blount, James H., American legislator; b. Macon, Ga., 12 Sept. 1837; d. 8 March, 1903. He first came into public notice in 1865, when, after having served in the Confederate army he was a delegate to the Georgia constitutional convention. Thereafter he devoted himself to the practice of law until 1872, when he was elected to Congress from the Sixth District of Georgia. He held his seat by successive re-elections till 1893, when he declined a further term. As he finished his last term the House paid him the unusual honor of suspending its proceedings to give the members an opportunity to testify to

BLOUNT—BLOWING-MACHINE

their appreciation of his worth. In his last term he was chairman of the Committee on Foreign Affairs, and his familiarity with American relations with other countries led President Cleveland to appoint him commissioner paramount to Hawaii in March, 1893, for the purpose of investigating the deposition of the royal government and the establishment of the American protectorate over the kingdom. On his arrival in Honolulu he at once caused the American flag to be hauled down from the Provisional Government House, and the United States marines to be withdrawn from the locality. This proceeding led to considerable excitement in the United States; the withdrawal of United States Minister Stevens from Honolulu; the appointment of Commissioner Blount as his successor; and a renewal both in Washington and Honolulu of the agitation for the annexation of Hawaii to the United States. On the completion of his mission Minister Blount returned to his large Georgia estates. See HAWAII.

Blount, William, American statesman: b. North Carolina, 1754; d. Knoxville, Tenn., 21 March, 1810. He was a delegate from his native State to the Continental Congress in 1782, 1783, 1786, and 1787; a signer of the Federal Constitution in 1787, and governor of the territory south of the Ohio (1790). In 1796 he was chosen president of the Convention of Tennessee, and was elected the same year by that State to a seat in the U. S. Senate. But in 1797 he was expelled from that body for having, as it was alleged, instigated the Creeks and Cherokees to assist the British in conquering the Spanish territories near the United States. His impeachment merely served to increase his popularity at home, where he was promptly elected a member of the State Senate and chosen president thereof.

Blouse, blouz, a loose over-garment extensively worn by European laborers. Its use is so common among the workmen of France that the term the "Blouses" has become a synonym for this class. In England the same garment is known as a smock-frock. It is generally made of coarse linen, while the German blouse is sometimes of woolen material.

Blow, John, English musical composer: b. 1648; d. 1708. He became organist of Westminster Abbey at the age of 21, and in 1676 also organist of the Chapel Royal, and obtained the degree of Doctor of Music. In 1680 he resigned his post in Westminster Abbey to his pupil Purcell. In 1699 he was appointed composer to the Chapel Royal. He was a voluminous composer, but many of his works have never been printed. Among his sacred pieces are upward of 100 anthems, 14 church services, and various other compositions. A number of his secular compositions for one, two, or three voices, with accompaniment, were published under the name of 'Amphion Anglicus.'

Blow-fly, a common fly belonging to the family *Muscidae*. It is the large, noisy fly which enters houses, and was named *Calliphora vomitoria* by Linnæus. It is black on the head and thorax, while the abdomen is steel-blue. It is similar to the flesh-fly in habits, but instead of living larvæ it deposits its eggs which are long and cylindrical, in stacks ("fly-blows") on meat, cheese, etc. The larvæ hatch in 24 hours; they become fully grown in probably five or six

days, and transform into pupæ enclosed by a brown shell (puparium), formed by the drying and contraction of the larval skin. Oily or greasy substances are avoided by them, and by all other flies, and a cloth dipped in kerosene oil and suspended in a room will keep them from entering it. Another blow-fly is *Calliphora erythrocephala*, common to Europe and North America.

Blowgun, a weapon formerly used by the Indians inhabiting the shores of the Gulf of Mexico and still employed by some of the Indian tribes of South America, both in war and for killing game. It consists of a long, straight tube in which a small poisoned arrow is placed, and forcibly expelled by the breath. The tube or blowgun, called *gravatána*, *puncuna*, etc., is 8 to 12 feet long, the bore not generally large enough to admit the little finger. It is made of reed or of the stem of a small palm. Near Pará it is in general very ingeniously made of two stems of a palm (*Iriartea setigera*) of different diameters, the one fitted into the other. In some places the inner tube is formed of the thin stem of a reed, protected by an outer one of this palm. A sight is affixed to it near the end. The arrows used in that district are 15 to 18 inches long, made of the spines of another palm, sharply pointed, notched so as to break off in the wound, and their points covered with curari poison. A little soft down of the silk-cotton tree is twisted round each arrow, so as exactly to fit the tube. In Peru, arrows of only one and a half and two inches long are used, and a different kind of poison seems to be employed. An accidental wound from one of these poisoned arrows not infrequently proves fatal. In the hand of a practised Indian the blowgun is a very deadly weapon, and particularly when directed against birds perching in the tops of high trees. As his weapon makes no noise, the hunter often empties his quiver before he gathers up the game, and does more execution than a sportsman could with a double-barreled fowling-piece. In Borneo the Dyaks have a similar weapon called a *sumpitan*, which has an iron head tied on the end, so that it can be used as a spear. It is employed both in war and in hunting. Small arrows, which have on their end a piece of pith adapted to the bore of the tube, are used. These are pointed with sharp fish-teeth, poisoned with upas. They are blown with great accuracy; and if the upas juice is fresh, a wound from an arrow fired at a distance of 40 yards proves fatal to man.

Blowing-machine, a machine supplying large furnaces with a blast of air. It is necessary that the current of air should be propelled into the furnace with a certain rapidity and volume, and also with regularity; for which purpose many contrivances have been employed.

Bellows.—In minor operations two pairs of bellows may be used, so that while the one is emptying the other may be filling. Or what is called the double-bellows may be used, consisting practically of two bellows joined together by one of their boards, so that there are three boards instead of two, and two chambers instead of one. The upper chamber, to which the exit-pipe is attached, is filled from the lower, which is itself filled by means of a lever in the same way as the single bellows. The upper chamber is thus always supplied with air, which is forced

BLOWING-MACHINE

out through the exit-pipe by a weight or spring.

Piston Blowers.—For blast furnaces and for Bessemer steel converters, blowing engines of large size are employed. In the former, the strength of the blast sometimes is as high as 10 pounds per square inch. For the Bessemer converter, where a much greater pressure is required, it occasionally reaches 30 pounds per square inch. A blowing engine consists of a steam cylinder, an air cylinder, and a large air chamber, to ensure a uniform blast. Sometimes the latter is dispensed with, and large main pipes used instead. The blowing cylinder is of cast iron, with an airtight piston, which, as it ascends and descends with the motion of the engine, alternately inhales and expels the air at each end. To effect this, a series of valves are provided and these are arranged as follows: Inlet valves are placed on the top of the cylinder, and also on three sides of the box, but on the fourth side there are two outlet valves. These valves consist of numerous openings, against which leather flaps lie when they are shut. Valves of a similar nature are placed at the bottom of the cylinder. When the piston descends, it would create a vacuum in the upper portion of the cylinder, provided there were no openings in it; but the external air pressing on the inlet valves, opens them, and fills the space above the piston; at the same time, the outlet valves, which only open outward, are tightly closed by the air pressing inward from the pipe. Again, when the piston ascends, it compresses the air above it, and exactly reverses the action of the valves; that is to say, it shuts the inlet valves, opens the outlet valves, and allows the compressed air to pass along the outlet pipe, which is made of large size, so as to offer as little resistance as possible to the passage of the air. The valves at the bottom of the cylinder work exactly in the same way, the inlet valves opening when the piston ascends, and shutting when it descends, thus compelling the inhaled air to pass into the pipe, by the lower outlet valves. The air is conducted by the pipe into a receiver of large capacity, which serves to equalize the blast before it passes to the tuyeres. A blast engine at Shelton Ironworks, in England, with a blowing cylinder 8 feet 4 inches in diameter, a 9-foot stroke, 186 horse-power, and making 32 single strokes of the piston per minute, inhales 15,700 cubic feet of atmospheric air per minute; but this is compressed by the blowing cylinder to a pressure of 3 pounds per square inch above the atmosphere, which reduces the volume supplied by the cylinder to 13,083 cubic feet. Its volume, however, is largely increased again, when raised to the hot-blast temperature, before entering the furnace.

Jet Blowers.—In the Catalan forges of Spain, the south of France, and some parts of the United States, there is a very ingenious water blowing-machine in use called a *trompe*; but it can only be advantageously employed where a fall of a few yards of water is available. A cistern to act as a reservoir for the water; pipes (generally two in number), through which it descends; and a wind-chest to allow the air and water to separate, constitute the essential parts of the apparatus. It is put in operation by lifting the wedge with a lever; this allows the water to rush down the pipe, and, in doing so, draws in air through sloping holes, called

aspirators, at the throat of the pipe. A continuous current of water and air is thus supplied to the wind-chest, which is provided with an opening for the escape of the water, while the air passes out in a regular stream by the nozzle-pipe. The height from which the water falls determines the tension of the blast; but the height seldom exceeds 27 feet, which gives a pressure of from $1\frac{1}{2}$ to 2 pounds to the square inch. The separation of the air from the water is greatly promoted by the current impinging on the platform.

Fans.—The fan is another machine for producing blasts of air. It is employed for such purposes as the melting of pig iron in foundries and for forge fires. It is also used as an exhaust to withdraw foul air from mines, public buildings, and ships. For mines it is occasionally of a very large size. The winnowing of corn is another application of it. The common blast fan is like a wheel with the arms tipped with vanes or blades, instead of being joined by a rim, and it is placed usually in an eccentric position, inside a chest, with central openings on each side for the admission of air. It is generally driven by steam power, and as it revolves, air is sucked in at the centre, drawn toward the tips, and impelled forward through the exit-pipe. Blast fans seldom exceed 3 feet in diameter. The number of revolutions made per minute ranges from 700 to 1,800; but the pressure of the fan blast does not usually go beyond 6 ounces per square inch for ordinary foundry cupolas. Schiele's fan has numerous curved blades and is nearly noiseless. It does not require much power to drive it, and has been very much used. Lloyd's fan has also curved blades, but they are fewer in number than in Schiele's.

Positive Blowers.—These are machines introduced in comparatively recent years. They act by regular displacement of the air at each revolution, since their pistons or drums closely fit their cases. In this respect they differ from fans, because, although there were no outlet for the blast, a fan could be kept revolving, but in such a case a pressure blower would stop. The rotary blower of Roots, of Connersville, Ind., is one of the best known, and is now very largely used in producing blasts in metallurgical operations, as well as for other purposes, in the United States and Europe. Its most improved form consists of a pair of horizontal shafts traversing a case of the form of two semi-cylinders, separated by a rectangle equal in depth to the diameter of the semi-cylinders, and in width to the distance between the centres of the shafts. These shafts carry a pair of solid arms or pistons, the relative positions of which are maintained by external gearing at both ends provided with safety coverings. Each has a section somewhat resembling the figure "8", the action of which, as they revolve, takes the air in by an aperture at the bottom of the machine, and expels it with considerable pressure, if required, at the top. It gives a much greater pressure of blast than is attainable by the fan. Another machine of this kind, designed by J. G. Baker, of Philadelphia, is employed for the same purposes as Root's. It has a central drum with two vanes fairly fitting the two ends and the bored semi-cylindrical top of the case. Two lower drums, crescent-shaped in section, work by external gears at double the velocity of the central

drum, the vanes of which move successively through the opening in each of the lower drums. The latter turn so as alternately to form abutments to prevent escape of air from either the entrance or delivery side. These rotary blowers produce blasts from a few ounces up to 3 pounds per square inch.

Blowitz, Henri Georges Stéphane Adolphe Oppèr de, òn-rè zhòrzh stà-fàn àd-òlf òp-per dè blò-vitz, French journalist: b. Pilsen, Austria, 28 Sept. 1832; d. Paris, 18 Jan. 1903. He settled in France; was successively appointed professor of German in the Lycée of Tours and at Limoges, Poitiers, and Marseilles; was naturalized a French citizen in 1870; and became the Paris correspondent of the London *Times* in 1871. Laurence Oliphant was then the correspondent at Paris, and de Blowitz became his assistant. During the war of 1870-1 Mr. Oliphant was excluded from Paris during the siege by the Germans, but de Blowitz, by means of carrier pigeons, balloons, and numerous ingenious devices, kept his chief outside the city walls informed as to what was going on within the beleaguered city. He was noted for his success in obtaining secret and important information long before it was ready for official promulgation; and for his personal interviews with Thiers, Bismarck, Comte de Chambord, Alfonso XII., Gambetta, the Comte de Paris, the Sultan of Turkey, Marquis Tseng, the King of Rumania, Leo XIII., Jules Ferry, Duclerc, Prince Lobanoff and many other eminent men of the time in Europe. Many of his disclosures in his letters to the *Times*, such as the text of the Treaty of Berlin, which he forwarded before it had been signed, created much excitement throughout Europe. He contributed more than 4,000 columns to the *Times*; was made an officer of the Legion of Honor, an officer of the Institute of France, and doctor of philosophy. He published 'Feuilles Volantes' (1858); 'L'Allemagne et la Provence' (1869); 'Le Mariage Royal d'Espagne' (1878); 'Une Course à Constantinople' (1884). He retired from his position as *Times* correspondent only three weeks prior to his death.

Blowpipe, an instrument by means of which the flame of a candle, a gas-jet, etc., is made to produce an intense heat, being then employed for a variety of useful purposes. Its most usual form is described in the article on blowpipe analysis (q.v.). It is employed by jewelers and goldsmiths in the work of soldering, and by other workers on small metallic objects; by the glassblower in making thermometers, barometers, and other glass instruments; by the enameler; and indeed wherever it is required to subject a small body to a strong heat. It has undergone a variety of improvements in the hands of the chemist, to whose researches it has proved an excellent auxiliary. Wollaston's portable blowpipe is formed of three pieces fitted into one another when in use, but which may be taken down and made to slide within each other. Most laboratory blowpipes have a hollow bulb or enlarged part at or near the end, the object of which is to condense the vapor of the breath, which often proves injurious in the common form of the instrument. To prevent corrosion from the action of the moisture, the bulb is made either of silver or sheet-tin, and it is capable of being opened in order that

it may be more easily cleaned. A little practice is necessary to enable the operator to keep up a constant blast for any length of time, the current of air being propelled through the pipe by the muscular exertion of the cheeks, while respiration is carried on through the nose. But when the process has to be long continued, the current of air is supplied by bellows. This is the form commonly used by glassblowers. The gas blowpipe, commonly called the oxyhydrogen blowpipe, is a very important and intensely powerful variety, whose structure is due to Mr. Newman of London. Sir Humphry Davy suggested the employment of other gases instead of common air, and Dr. Clarke of Cambridge adopted the suggestion. Dr. Clarke found that a mixture of two volumes of hydrogen and one of oxygen produced the greatest effect. These gases are contained in a bladder attached to the end of a pipe which leads into a vertical cylinder, in which is fitted a piston, working through a collar at the top. By the action of this piston the gas from the bladder is compressed into a copper chamber, and thence issues to the flame through an ordinary blowpipe nozzle. To guard against explosions, the gases are kept in separate holders, and by means of a special kind of burner are prevented from mixing until they are just going to be burned. There are various other species of blowpipe, and many uses to which they may be applied. For information on the subject see Plattner, 'On the Blowpipe' to whom the present form of the instrument is due.

Blowpipe Analysis, a branch of chemical analysis in which the composition of the substance under examination is inferred from its behavior when subjected to certain flame tests. The blowpipe itself commonly consists of a tapering brass tube about eight inches long, provided with a bell-shaped mouthpiece at one end, and at the other with a nozzle that is turned at right angles to the general length of the instrument. The nozzle should be tipped with platinum, and provided with a very minute perforation through which the operator blows a tiny blast of air that drives the flame of his lamp against the object to be analyzed. The flame used in blowpipe work should not be round and colorless, like those of spirit lamps and Bunsen burners, but should be flat and luminous, containing plenty of free, incandescent carbon. A large candle-flame serves very well, although it is not flat. Usually a gas-flame is employed, in connection with a burner formed by flattening a piece of brass tubing, and then cutting it off at the top, at an angle. When the blowpipe is in service its tip is introduced into the flame of the lamp, which the air-blast deflects laterally in the form of a long, almost non-luminous cone, which consists of two visibly different portions. The inner part is somewhat brighter, and is richer in unoxidized gases. The outer layer, being more plentifully supplied with oxygen, consists almost entirely of completely oxidized gases. The outer portion of the blowpipe flame is called the "oxidizing flame," since this part, when directed against the specimen under examination, heats it while it is in contact with the air, and causes it to oxidize, if it is capable of doing so at the temperature that is attainable by the blowpipe. The inner portion of the flame is called the "reducing flame,"

BLOWPIPE ANALYSIS

from the fact that when the specimen is exposed to this part, it is heated, not in contact with the air, but while surrounded with an atmosphere of partially unoxidized hydrocarbon gases. Under these circumstances many metallic oxides give up their oxygen to the hot hydrocarbon gases in which they are bathed, and are themselves reduced to the metallic form. If a flame still richer in free carbon and uncombusted hydrocarbons is desired, the tip of the blowpipe is held just outside of the lamp-flame, and a jet of flame with a luminous tip containing particles of solid carbon can easily be thrown down upon the specimen.

In blowpipe analysis there is no recognized "scheme" to be followed out. The method is oftenest used for the determination of minerals, and in such cases the analyst usually has some sort of idea, in advance, of the elements that may possibly be present. The substance to be examined is usually first pulverized, and a portion of it heated in a tube that is open only at the upper end. If it carbonizes, it contains organic matter of some kind, and the odor that is produced is often a good indication as to whether the organic matter is of an animal or vegetable nature. If the substance, when heated in the closed tubes, gives off water which condenses in the upper part of the tube, the moisture so condensed should be tested with litmus paper. If it is neutral, the substance is a hydrated compound, or a hydroxide. An acid reaction indicates acid salts, and an alkaline one may usually be taken to indicate the presence of compounds of ammonia. If the substance melts but does not change its color, it is an alkaline or a hydrated salt. If it melts and turns yellow, remaining yellow even after cooling, it contains oxide of bismuth; while if it melts to a yellow color, but turns red upon cooling, it contains oxide of lead. If it does not melt, but changes color, the indications are as follows: Yellow, both hot and cold, indicates stannic oxide; if yellow while hot, but white when cold, zinc oxide; if black while hot, and reddish-brown when cold, ferric oxide; if black while hot, but bright red when cold, mercuric oxide. If gas is evolved, its nature should be determined. Oxygen may be detected by the kindling of a glowing splinter of wood inserted into the tube; carbon dioxide by its extinguishing such a spark promptly; carbon monoxide by the gas burning with a bluish flame when ignited at the mouth of the tube; sulphur dioxide, ammonia and cyanogen, by the odor. Oxygen indicates chlorates, peroxides, etc.; carbon dioxide indicates carbonates or oxalates; carbon monoxide indicates oxalates or formates; sulphur dioxide indicates certain sulphites or sulphates; cyanogen indicates cyanides; and ammonia indicates some compound of that substance. If the gas is reddish-brown in color, bromides, nitrates, or nitrites, are probably present; if it is violet, an iodide is indicated. A sublimate may also be deposited upon the tube. If the sublimate is black, or nearly so, selenium or mercuric sulphide are indicated; if yellow, sulphur or a sulphide; if white, a salt of ammonia or mercury, a volatile organic acid, or an oxide of antimony or arsenic. Gray metallic globules indicate mercury, and a metallic mirror may represent either antimony or arsenic.

When the substance is heated in an inclined tube, open at both ends, similar indications are

to be observed; modified somewhat, however, by the fact that oxygen can now pass up through the tube and come in contact with the specimen under examination. Thus sulphides are commonly oxidized in the open tube, arsenic will sublime as the trioxide and not as the metal, and selenium gives a sublimate that may be gray or red, and also a strong odor of horseradish.

The color that the specimen communicates to the non-luminous part of the flame is likewise of great service in determinations by the blowpipe. A piece of platinum wire, bent at the end into a small loop, is dipped in hydrochloric acid and held in the flame, this process being repeated several times until the analyst is confident that the wire itself is free from any substance that can color the flame. The little loop at the end is then brought into contact with some of the finely pulverized specimen, and introduced into the flame again. Sodium gives a strong lasting yellow; calcium an orange red; lithium and strontium a crimson; potassium a lavender; barium an apple green; thallium, copper, and boracic acid a brighter green; lead and antimony a pale blue; selenium a deep blue. The yellow due to sodium is so powerful, even when that metal is present only in slight amounts, that the colors due to the other metals present are sometimes difficult to observe by the unaided eye. Hence colored glasses are often used, through which to take note of the flame color; the tint of the glass being selected so as to cut off the yellow light of the sodium, while allowing the particular color that is sought to pass through unobstructed. Cobalt blue glass, for example, is used in this way in testing, by flame coloration, for potassium.

When a sample of the specimen to be analyzed is heated upon charcoal, it is often possible to obtain some of the elements that are present, in the form of a metallic bead, by the reduction of their oxides or of the other compounds in which they were originally contained. Lead, tin, and silver give beads that are white and malleable; copper gives a malleable red bead; antimony and bismuth give brittle beads; and iron, cobalt, and nickel may often be obtained in the form of gray, magnetic, powders.

While the substance is being heated upon charcoal, an incrustation commonly forms on the charcoal, from the character of which useful inferences can be drawn. Thus antimony gives a white incrustation; bismuth, an incrustation that is deep yellow when hot and lighter yellow when cold; lead, one that is light yellow when hot and deep yellow when cold, and is surrounded by a white border; arsenic gives a white incrustation that is very volatile; and with zinc the color is yellow when hot and white when cold.

Many metallic oxides are soluble in melted borax, and valuable color indications are obtained by heating small quantities of the substance in little beads of melted borax, that are held in the flame upon tiny loops of platinum wire. The phenomena that are observed in this way are quite complicated, however, and for an account of them the manuals on blowpipe analysis should be consulted. See Cornwall, 'Manual of Blowpipe Analysis'; Moses and Parsons, 'Elements of Mineralogy, Crystallography, and Blowpipe Analysis'; Dana, 'Minerals and How to Study Them.'

BLUCHER

Blücher, Gebhard Leberecht von, gëb'härt lā'be-rëht fön blü-kër (PRINCE of WAHLSTADT: vāl'stāt), Prussian soldier: b. Rostock, 16 Dec. 1742; d. Krieblowitz, Silesia, 12 Sept. 1819. When 14 years of age he visited the island of Rügen, where the sight of some Swedish hussars aroused a desire to become a soldier, and in spite of the opposition of his parents and relatives he took service in a Swedish regiment as cornet. His first campaign was against the Prussians, and he was taken prisoner by the same regiment of hussars which he afterward commanded. The commander of this regiment, Col. von Belling, induced him to enter the Prussian service. An exchange was agreed upon with the Swedes, and Blücher was made lieutenant in Belling's regiment. Discontented at the promotion of other officers over his head, he left the army, devoted himself to agriculture, and by industry and prudence acquired an estate. After the death of Frederick II. he became a major in his former regiment, which he commanded with distinction on the Rhine 1793-4. Orchies, Luxemburg, Frankenstein, Oppenheim (16 Jan. 1794), Kirrweiler and Edisheim in the Palatinate, bear witness to his achievements. After the battle of Kirrweiler, in 1794, which added greatly to his reputation, he was appointed major-general of the army of observation stationed on the lower Rhine. In 1802, in the name of the king of Prussia, he took possession of Erfurt and Mühlhausen. On 14 Oct. 1806, he fought at the battle of Auerstädt. He then, with the greater part of the cavalry, followed the retreat of the Prince of Hohenlohe to Pomerania. His squadron, moving on the left of the main army, became separated from it, and the Prince of Hohenlohe was forced to surrender at Prenzlau. Blücher, cut off from Stettin by this accident, threw himself into Mecklenburg where he joined at Dambeck the corps of the Duke of Weimar, commanded by Prince William of Brunswick-Oels. All the troops, however, were too much fatigued to undertake any enterprise. Having the Grand Duke of Berg on his left flank, the Prince of Ponte Corvo in his front, and Marshal Soult on his right, Blücher was obliged to take post behind the Trave in order to draw off the three great divisions of the French forces from the Oder as long as possible. With this view he entered the territory of the free city of Lübeck, which was soon stormed by the French. Although Blücher escaped with some troops he was obliged to surrender at Ratkau on 6 November, but with a clause in the capitulation that he "accepted it only from want of ammunition, provisions, and forage." He was soon exchanged for the French general Victor, and on his arrival at Königsberg was placed at the head of a corps and sent to Swedish Pomerania to share in the defense of Stralsund and to assist the efforts of the Swedes. After the Peace of Tilsit he labored in the department of war at Königsberg and Berlin. He then received the chief military command in Pomerania, but at the instigation of Napoleon was afterward dismissed from the service. In the campaign of 1812, when the Prussians assisted the French, he took no part; but no sooner did Prussia rise against her oppressors than Blücher, already 70 years old, engaged in the cause with all his former activity. He was appointed commander-in-chief of the Prussian army and the Russian

corps under Gen. Winzingerode, which at a later period was separated from him. In 1813 he was created field-marshal. His heroism in the battle of Lützen (2 May 1813) was rewarded by the Emperor Alexander with the order of St. George. The battles of Bautzen and Hanau, those on the Katzbach (26 Aug. 1819) and Leipsic added to his glory. On the Katzbach Blücher defeated the army of Marshal Macdonald and delivered all Silesia. On 3 October Blücher crossed the Elbe at Wartenburg, and encouraged the Bohemian army under Schwartzberg, and the northern army under the crown-prince of Sweden, to act with more spirit. On 16 October he gained a signal advantage over Marshal Marmont at Möckern, forcing his way as far as the suburbs of Leipsic. On the 18th, in connection with the crown-prince of Sweden, he contributed greatly to the defeat of the enemy, and on the 19th his troops made the first assault upon Leipsic. His promptitude and peculiar manner of attacking had already procured him from the Russians the name of "Marshal Forward." On 1 Jan. 1814, with the Silesian army, which now consisted of two Prussian, two Russian, one Hessian, and one mixed corps, he crossed the Rhine at Kaub, took possession of Nancy on the 17th, gained (1 February), the battle of La Rothière, and pushed forward toward Paris. His detached corps were, however, checked by Napoleon; yet Blücher, though with a great loss, effected his retreat toward Châlons. He then crossed the Aisne at Soissons, joined the northern army, obtained (9 March) a victory over Napoleon at Laon, and, in connection with Schwartzberg, at the close of the month, pressed forward to Paris. The day of Montmartre crowned this campaign, and on 31 March Blücher entered the capital of France. For this triumph he was created Prince of Wahlstadt, with a suitable income. In England, whither he followed the allied monarchs in June of the same year, he was received with enthusiasm. The University of Oxford conferred on him the degree of Doctor of Laws. He then lived on his estates in Silesia till 1815, when the chief command was again committed to him, and he led his army into the Netherlands. On 15 June Napoleon threw himself upon him, and Blücher, on the 16th, was defeated at Ligny. In this engagement his horse was killed, and he was thrown under his body. In the battle of the 18th Blücher arrived at the most decisive moment upon the ground, and, taking Napoleon in the rear and flank, assisted materially in completing the great victory of Belle Alliance, or Waterloo (q.v.). He refused the proffered armistice, and forced Paris to surrender; opposing with energy, on this second conquest of the capital, the system of forbearance practised on the former occasion. As he was already a knight of all the military orders of Europe, the king of Prussia, to reward his new services, created the new order of the Iron Cross expressly for him. After the Peace of Paris he retired to his estate, where he died. On the anniversary of the battle on the Katzbach, a monument commemorating his glory, executed by Schadow in Berlin, was erected at Rostock. On that of Waterloo (18 June 1826) a bronze statue 12 feet in height, modeled by Rauch, was erected to his memory in Berlin. Blücher was not so eminent for military science as for ability in action. His simplicity, good nature, and bravery endeared him to his sol-

diers, who loved him as a father. His addresses and proclamations are distinguished for their brevity, precision, and simplicity. Consult 'Blücher's Life,' by Varnhagen von Ense (Berlin 1827); and Scherr's 'Blücher's Life and Times' (Leipsic 1862).

Blue, Victor, American naval officer: b. North Carolina, 6 Dec. 1865. He graduated at the naval academy June 1887, and serving through the grades of ensign and junior lieutenant, was promoted lieutenant 3 March 1899. At the outbreak of the war with Spain he was ordered to the gunboat *Suwanee*, and while on duty off the Cuban coast captured two Spanish patrol sloops having on board a heliographic signal outfit. On 11 June 1898 he landed at Aserraderos, passed through the Spanish lines, proceeded to the hills overlooking Santiago city and harbor, where he located the Spanish fleet commanded by Admiral Cervera. On 25 June he made a further reconnaissance and mapped the position of the Spanish ships. To accomplish these things he traveled a distance of nearly 140 miles, mostly through territory occupied by the intrenchments of the Spanish army. Admiral Sampson highly commended the manner in which these tasks had been performed and recommended that Lieut. Blue be advanced ten numbers as a promotion. He was placed in command of the captured gunboat *Alvarado*, and on 12 Aug. 1898 bombarded the fortifications of Manzanillo. Subsequently he served in China and the Philippines.

Blue, one of the seven primary colors. The blue pigments commonly employed by artists are few in number, including native and artificial ultramarine, cobalt, indigo, and Prussian blue. Genuine ultramarine, prepared from the mineral lapis lazuli, and ordinary cobalt blue, sold for artists' work, are permanent colors. They are used either alone, or mixed with other pigments, chiefly for skies and distances in landscape, and by themselves, or to make up grays and other mixed tints in figure painting. Owing to the exceptionally high price of real ultramarine, the artificial color, which is of doubtful permanency, is usually substituted for it. Prussian blue and indigo are highly useful colors, since it is only these that yield dark blues, and only from them, mixed with yellows or browns, that strong greens can be obtained. It is unfortunate accordingly that both are more or less fugitive. All the blues above named are used both in oil or water color painting, but indigo less than the others in oil, since it is most apt to fade in that medium.

A number of different names are used in commerce for what is essentially the same pigment, or for pigments closely resembling one another. The following statement gives some explanation of these: Cobalt blues are mixtures of cobalt with earthy or metallic bases, which have been subjected to the action of heat, and have received the following names: Cobalt blue, cerulean blue, royal blue, Dumont's blue, Saxon blue, Thénard's blue, Leithner's blue, Hungarian blue, Zaffre or enamel blue, Vienna blue, azure blue, and Paris blue. The last name is also applied to a Prussian blue, and azure is also given to a variety of ultramarine blue. Smalt is a powdered cobalt glass used in illumination and flower painting. Artificial ultramarine is also called French ultramarine, French blue, new

blue, and permanent blue. Coarse qualities of this color are largely used by house painters. Intense blue is a refined indigo. Prussian blue (sesqui-ferrocyanide of iron) is otherwise named Berlin blue, Paris blue, and ferrocyanide of iron. The name Paris blue is also given to a cobalt color. Antwerp blue is a variety of Prussian blue made lighter by the addition of an aluminous base, and not so permanent. Blue ochre (hydrated phosphate of iron) is a subdued permanent blue, but not much employed. Blue verditer is a hydrated oxide of copper which changes and ultimately blackens by time. It is used in distemper work and paper staining. Blue was adopted as their distinctive color by the Scottish Covenanters in the 17th century and is the usual color of the uniforms of the soldiers of the United States army. A dark shade of this color is generally worn by the sailors of most countries, whence the term navy blue is derived.

Blue Beech. See HORNBEAM.

Blue Bird, or the North American thrush, is widely distributed throughout the United States, where it holds a similar place, in the hearts of the people, as the redbreast in England. In fact, locally, it is sometimes termed "blue-robin." It is a smaller bird than the rest of the thrushes. Its whole upper parts are sky blue, shot with purple, with its throat, neck, breast, and sides reddish chestnut, and part of its wings and its tail feathers black. The "soft and agreeable warble" of the bluebird is one of the first and most welcome sounds of bird-music, that we hear in the early spring. The male is remarkably attentive to his more protectively colored mate, and takes exuberant pride in their five or six pale-blue eggs, laid in holes in the trees of gardens, and often also in bird-boxes, and in the crevices in the walls of outbuildings. There are often two broods in a season. The bluebird fights hard to protect his small, neatly constructed nest from the house-sparrow, swallows, wrens, and other birds, which make his life miserable by their intrusion on his domestic privacy. Several other sorts of birds, of other countries, prevailing blue in color, receive the name "bluebird," such as the "Oriental fairy-bluebirds" of the genus *Irena*, more particularly *Irena puella*, one of the East Indian bulbuls.

Blue Books, the official reports, papers, and documents printed for the British government to be laid before the Houses of Parliament. They are so called simply from being stitched up in blue paper wrappers, and include bills presented to, and acts passed by, the houses; reports and papers moved for by members or granted by government; reports of committees; statistics of trade, etc. The term is used also in a broad way as descriptive of special reports put forth by the government of any country or its various executive departments. In the United States the published lists of government employees and the navy regulation manual are known as Blue Books and the foreign diplomatic correspondence is commonly issued in Red Books. French official reports, etc., are called Yellow Books; those of Italy are styled Green Books, and those of Spain Red Books.

Blue Boy, The, a celebrated picture by Gainsborough, dated 1679; its subject, a boy dressed in a blue satin 16th century costume.

BLUE-COAT SCHOOL — BLUE LAWS

Blue-coat School. See CHRIST'S HOSPITAL.

Blue Flag. See IRIS.

Blue Grass, Kentucky Blue Grass, June Grass, Meadow Grass, Spear Grass, a species (*Poa pratensis*) of the natural order *Craminae*, native of the cooler parts of the northern hemisphere. The plant is a perennial with very numerous rootstocks and long, soft radical leaves. The more or less leafy stems which rise from one to two feet are terminated by a loose, pyramidal panicle three to four inches long, which readily distinguishes it from its somewhat larger close relative, Texas blue grass (*P. arachnifera*), in which the panicle is contracted and which is further distinguished by its woolly seeds. Blue grass forms a dense sod, which is very resistant to the trampling of stock, upon soils favorable to its growth, and is ranked as the best pasture and lawn grass throughout its range in districts and upon soils adapted to it. It attains its highest development upon limestone soils, and where found growing naturally, is considered to indicate a superior agricultural soil especially useful for stock raising. The Blue Grass region of Kentucky, which also extends into Tennessee, and from which the former State derives one of its popular names, is of limestone formation, and is noted for its superior, strong-boned, well-formed stock, especially horses. Upon soils other than limestone this grass does not produce so well and upon sandy soils it usually fails. Blue grass hay is of high quality, but is produced in too small amount to pay as well as other hay grasses. The hay cut when the seed is in the milky stage, has the following composition: Nitrogen-free extract, 34.3; crude fibre, 24.5; water, 24.3; ash, 7.0; proteid matter, 6.3; fat, 3.6. If the grass be allowed to mature its seed before being cut it is somewhat less nutritive because of the change in the relative proportion of nutrient material to non-digestible matter. The composition of the fresh grass is as follows: Water, 65.1; nitrogen-free extract, 17.6; crude fibre, 9.1; proteid matter, 4.1; ash, 2.8; fat, 1.3. Texas blue grass (*P. arachnifera*) is a valuable species for the Southern States, where Kentucky blue grass is less resistant to the effects of drouth. Both species may be propagated by sowing seed or by setting out pieces of sod, a method most commonly practised with the southern species, because of the difficulty of spreading its woolly seeds evenly. The method is very popular in lawn-making with the northern species. Since the seed of Kentucky blue grass is often of low vitality, and is frequently mixed with chaff, it should be sown rather thickly. A permanent blue grass pasture requires about three years to become established, after which, without much attention, beyond ordinary fertilizing, it may remain profitable for half a century or more. In long settled districts there are occasional pastures of more than 75 years standing.

Blue Grass State, a nickname for Kentucky.

Blue-green Algæ. See CYANOPHYCEÆ.

Blue Hen State, a nickname for Delaware. During the War for Independence, a certain popular officer of Delaware, named Capt. Caldwell, asserted that a game cock to be unconquerable must be "a blue hen's chicken." This name

was at once applied to his regiment and later to the State and its people.

Blue Island, Ill., a city of Cook County situated on the Calumet River and on the Illinois C., the Chicago, R. I. & P., the Chicago & G. T., and the Chicago & C. T. R.R.'s. It forms a southern suburb of Chicago, about two miles south of the city limits, and is an important manufacturing, commercial, and railroad centre. Among its industries are brick-making, stone-quarrying, etc. There are also smelting-works, oil-works, and breweries. It was settled in 1833 and incorporated in 1872. The municipal organization provides for a mayor with a term of two years, and a city council. The city operates its own waterworks and electric light system. Pop. (1900) 6,114.

Blue Jay. See JAY.

Blue John, a name for fluorspar (q.v.).

Blue Laws, a term sometimes applied to the early enactments of several of the New England colonies, but more frequently limited to the laws of New Haven Colony. The origin of the term is not exactly known. Various conjectures have been made, but the most probable derivation is that given by Prof. Kingsley, who thinks the epithet "blue" was applied to any one who immediately after the Restoration of the Stuarts looked with disapprobation on the licentiousness of the times. Thus, in Hudibras,

For his religion, it was fit
To match his learning and his wit;
'Twas Presbyterian true blue.

That this epithet should find its way to the colonies was a matter of course. It was here applied not only to persons, but to the customs, institutions, and laws of the Puritans, by those who wished to render the prevailing system ridiculous. Hence, probably, a belief with some that a distinct system of laws, known as the blue laws, must somewhere have had a local habitation. The existence of such a code of blue laws is fully disproved. The only authority in its favor is Rev. Samuel Peters, whose 'General History of Connecticut' (1781) is a spiteful, satirical work, full of exaggerations. The traditions upon this subject, from which Peters framed his stories, undoubtedly arose from the fact that the early settlers of New Haven were uncommonly strict in their application of the "general rules of righteousness." Judge Smith, in his continuation of the history of New York, published in 'New York Historical Collections,' Vol. IV., gives evidence against the existence of the blue laws, which is particularly valuable, as it was put on record some 15 years before Peters' history was published. He writes: "Few there are who speak of the blue laws (a title of the origin of which the author is ignorant), who do not imagine they form a code of rules drawn up for future conduct, by an enthusiastic precise set of religionists; and if the inventions of wits, humorists, and buffoons were to be credited, they must consist of many large volumes. The author had the curiosity to resort to them when the commissioners met at New Haven for adjusting a partition line between New York and Massachusetts in 1767; and a parchment covered book of demi-royal paper was handed him for the laws asked for, as the only volume in the office passing under this odd title. It contains the

BLUE LIGHT—BLUE-STOCKING

memorials of the first establishment of the colony, which consisted of persons who had wandered beyond the limits of the old charter of Massachusetts Bay, and who, as yet unauthorized by the Crown to set up any civil government in due form of law, resolved to conduct themselves by the Bible. As a necessary consequence, the judges they chose took up an authority which every religious man exercises over his own children and domestics. Hence their attention to the morals of the people in instances with which the civil magistrate can never intermeddle in a regular well-policed constitution, because to preserve liberty they are recognizable only by parental authority." See Trumbull, 'True Blue Laws of Connecticut and New Haven, and the False Blue Laws Invented by Rev. Samuel Peters' (1876); Prince, 'An Examination of Peters' Blue Laws,' in Annual Report of the American Historical Association for 1898.

Blue Light. See BENGAL LIGHT.

Blue-light Federalists, a term applied to the party in American politics which opposed the War of 1812. In 1813 Decatur made several attempts on dark nights to escape from the blockaded port of New London, Conn. He declared that his failure was due to signals of blue lights flashed from the shore to warn the British. This led to the opponents of the war, who were accused of having shown the lights, being stigmatized as "Blue-light Federalists."

Blue Lodges, a secret association of advocates of slavery, organized about 1854, in Missouri, for the purpose of aiding the work of establishing slavery in Kansas. The members of the order, although citizens of Missouri, crossed into Kansas in 1855 and forcibly deposited their ballots for the pro-slavery candidates.

Blue-Mantle, one of the English pursuivants at arms, connected with the Heralds' College, so styled from the color of his robe.

Blue-mass. See MERCURY.

Blue Monday, a name formerly given in Europe to the Monday before Lent, when the churches were decorated with blue. It was kept as a holiday by classes whose ordinary avocation required them to labor on Sundays. As this led to violent disturbances the custom was legally abolished. The term now signifies a Monday of depression, or blue spirits, particularly among clergymen, but is very loosely used, and by hard-working persons is applied to Monday in general.

Blue Mountains, (1) a beautiful wooded range of mountains in Oregon, from 8,000 to 9,000 feet high, which, with the Powder River Mountains, separate the Columbia River valley from the Great Basin; (2) a mountain chain of New South Wales, part of the great Dividing Range. The highest peak is Mount Beemarang, which attains an elevation of 4,100 feet above sea-level. The range is now traversed by a railway, which attains a maximum height of 3,494 feet; (3) the Central mountain range of Jamaica, the main ridges of which rise to 8,000 feet; (4) the second main ridge of the Appalachians, known also as the Kittatinny Mountains in Pennsylvania, as the Shawangunks in New York. This range should not be confounded with the Blue Ridge (q.v.).

Blue Nile. See NILE.

Blue Nose, a popular nickname for a native of Nova Scotia.

Blue Peter, a blue flag having a white square in the centre, used to signify that the ship on which it is hoisted is about to sail, and for recalling boats. The term is a corruption of Blue repeater, one of the signal flags in the British code. A flag known as the comet is used as a sailing signal in the United States instead of the blue peter.

Blue-pill. See MERCURY.

Blue Point, N. Y., the southern extremity of Patchogue Bay, Long Island, which lends its name to the well-known oysters, Blue Points.

Blue Print, a positive photographic print from a transparent negative on paper sensitized by potassium ferricyanide and citric acid, giving white lines on blue ground.

Blue, Prussian. See DYES.

Blue-ribbon Army, the name of an English total abstinence society, so called from the color of the membership badge. The organization grew out of the Murphy Movement in America and dates from 1878. About five years later the society became known as the Gospel Temperance Union. See TEMPERANCE SOCIETIES.

Blue Ridge, the most easterly ridge of the Alleghany or Appalachian Mountains, which extends from the Hudson River southwest to Georgia. It first receives the name of Blue Ridge when it enters Virginia, the western portion of which it traverses. In south Virginia, the range becomes a broad plateau, which is at its widest in North Carolina, and is here crossed by the Black, Cowee, Nantahala, and South mountains, extending transversely to the axis of the Blue Ridge. The highest peaks of the range occur in the Black Mountain group, where are found Mount Mitchell or Black Dome, 6,710 feet; Guyot's Peak, Sandoz Knob, Gibbs's Peak, and a few others over 6,000 feet. In Virginia the Blue Ridge nowhere rises much above 4,000 feet, and in Pennsylvania and New Jersey its height is much less. Several large rivers pierce the ridge, such as the Hudson in the Highlands, the Delaware at the Water Gap, and the Potomac at Harper's Ferry. See also APPALACHIANS.

Blue-stone, or Blue-vitriol. See COPPER.

Blue-stocking, a pedantic woman; a lady regarded as too fond of learning. The origin of this name is thus given by Ecswell in his 'Life of Johnson': "About this time (1780) it was much the fashion for several ladies to have evening assemblies, where the fair sex might participate in conversation with literary and ingenious men, animated with a desire to please. These societies were denominated blue-stockings clubs, the origin of which name was as follows: One of the most eminent members of these societies was Mr. Stillingfleet, who always wore blue stockings. Such was the excellence of his conversation, that his absence was felt as a great loss, and it used to be said, 'We can do nothing without the blue stockings'; and thus by degrees the title was established." One of the most famous of these clubs was that which met at Mrs. Montagu's. This was sometimes honored by the presence of Dr.

BLUE THISTLE—BLUEFIELDS

Johnson, and its principal members have been sketched and eulogized by Hannah More, in her poem entitled the 'Bas Bleu.'

Blue Thistle. See BUGLOSS.

Blue-vitriol, called also **Blue-stone**, the salt, sulphate of copper, composed of sulphuric acid, oxide of copper, and water. It is a natural product of some mines of copper ores, and is also largely prepared for economical purposes. See COPPER.

Blueback, the salmon of the Fraser River, B. C., one of the most valuable of the Pacific salmon (q.v.). The name is given to various other fishes having bluish backs.

Bluebeard, a famous hero of legend and folklore, familiarized to English readers in the 18th century through a translation from the French of Charles Perrault, 1697. This tale of Bluebeard has been regarded by some as partly historic, of which the original was Gilles de Laval, Baron de Retz, who was burned at Nantes in 1440 for his cruelty to children, whom he is supposed to have enticed into his castle, where he sacrificed them to the devil. It is, however, really a *märchen*, and the leading idea of curiosity punished is world-wide. The forbidden chamber is a counterpart of the treasure-house of Ixion, on entering which the intruder was destroyed, or betrayed by the gold or blood that clung to him; also of Pandora's box, as well as of Proserpine's pyn that Psyche opened in spite of the prohibition. There are several parallels among the German fairy-tales collected by Grimm; and one feature at least is found in the Kaffir tale of the Ox (Callaway's 'Nursery Tales of the Zulus'). Variants are found in Russia, and among Gaelic popular tales; and in the Sanskrit collection 'Katha Sarit Sagara,' the hero Saktideva breaks the taboo, and like Bluebeard's wife, is confronted with the horrible sight of dead women. Possibly in the punishment following the breaking of the taboo may be a survival of some ancient religious prohibition; among the Australians, Greeks, and Labrador Indians, such an error was regarded as the means by which death came into the world. Frescoes of the 13th century have been found in Morbihan, Brittany, representing scenes from the similar legend of St. Trophime. Tales similar to that related by Perrault are found in Straparola's 'Piacevoli Notti' (1569), and in Abbatuti's 'Il Pentame-rone,' while a not very dissimilar tale is that of the Third Calendar in the 'Arabian Nights Entertainment.' Operas founded upon it are Grétry's 'Raoul Barbe-Bleu' (1789); Offenbach's 'Barbe-Bleu' (1866).

Bluebell, **Bellflower**, **Hairbell**, or **Harebell**, *Campanula rotundifolia*, a plant of the natural order *Campanulaceæ*, native of the colder parts of the northern hemisphere. Its common name is suggested by the shape and color of its flowers, and its specific name from the shape of its root-leaves. The stem leaves are lanceolate or otherwise than round. This is the bluebell of Scotland and of literature. It may be found peeping through the snow and ice which are supposed to be melted by the self-generated heat of these little plants. They have long been favorites in the hardy flower border and are of simplest culture. (See also *CAMPANULA*.) The name is also applied to a species of *Scilla* (q.v.).

Blueberry. See HUCKLEBERRY; *VACCINIUM*.

Bluebill, one of the most common of American fresh-water ducks, which breeds throughout Alaska and the northern part of Canada generally, spending the cold months in the United States, but going only as far south as is necessary to avoid the freezing of the lakes and ponds. The head, neck, and fore part of the body of the drake are black, the head with a green gloss. The back and sides are whitish with finely waved blackish markings. The abdomen and speculum of the wing are white. In the female the head and anterior parts are brown, and the face pure white. The most distinguishing part of the bird is the very broad, spatulate bill, which is light blue, with a black nail. Hence the other names "broadbill," and "scaup duck." There are two species, the larger (*Aythya marila nearctica*) the one just described, which is regarded as a variety of the European scaup duck; and the lesser (*A. affinis*), which is very similar to the preceding, but smaller, and rather more southerly in its distribution. These ducks are close relatives of the canvasback and redhead (qq.v.), and resemble them in habits. Other local names for them are "blackhead" and "shuffler."

Bluebottle, or Corn-flower See CENTAUREA.

Bluebottle Fly, a greenish-blue fly, sometimes called by English authors "green-bottle" fly (*Lucilia cæsar*). It closely resembles the blow-fly (q.v.), but is smaller and entirely blue or green. These flies hibernate through the winter, appearing early in spring. Its eggs are deposited upon meat and decaying animal matter. The larvæ are said to be indistinguishable from those of the blow-fly. They are white, footless maggots, of an elongated conical shape, which transform in the ground. It is said that bluebottle flies do not commonly enter houses.

Bluebreast. See BLUETHROAT.

Bluebuck, the name given by English workmen in South Africa to one of the duikers, the pigmy antelope (*Cephalophus monticola*) of Natal. These tiny creatures, which stand only 13 inches high, are the smallest of the antelopes, and grayish-blue in color, with short, spike-like horns, which hardly show above the tuft of stiff hairs on the top of their heads. They swarm in the thickets of southeast Africa, feeding on herbage berries and buds, scrambling about the rocks, and climbing leaning tree trunks, with amazing agility.

Blue-eye, a small and favorite species of honey-eater (*Entomomyza cyanotis*) with a conspicuous patch of blue about the eyes. It frequents the eucalyptus trees, and has the curious habit of depositing its eggs in a neat depression on the top of the big, oven-shaped nest of a certain starling, whenever it can find a deserted one. Otherwise it constructs a nest for itself. See HONEY-EATER.

Bluefields (formerly written BLEWFIELDS), a town on Nicaragua, on the Caribbean coast and at the mouth of the Escondido or Bluefields River. Lat. 12° N., lon. 83° 44' W. It was the capital of Mosquitia (see CENTRAL AMERICA). In the latter part of 1847 the population was about 600, one sixth white, five sixths black. Slavery was abolished in 1841. The king of Mosquitia, who resided here in one of the few

BLUEFIN—BLUING

houses built of boards, claimed sovereignty over a territory 235 miles wide and 340 miles long; also the districts of Talamanca and Chiriqui in Costa Rica. A British agent and consul-general also was stationed at Bluefields, the English government maintaining a protectorate over the Mosquito Indians until 1860. A German colony at Carlsruhe, adjoining Bluefields, was founded in 1844, but abandoned in 1849. The climate is moist and hotter than in the interior. In 1901 the company to which the Nicaraguan government granted a concession and monthly subvention for the establishment of a line of steamers agreed to make six trips a month between Bluefields and New Orleans, and to carry the mails between those points eight times monthly.

Bluefin, or Blackfin, a large cisco-like whitefish (*Argyrosomus nigripinnis*) of the deep waters of Lake Michigan and some other of the lakes of Wisconsin and Minnesota, readily known from other species by its black fins.

Bluefish The bluefish or "skipjack" (*Pomatomus saltatrix*) is one of the most widely distributed and abundant of sea-fishes, being found in the Atlantic from the Mediterranean and Nova Scotia to Brazil, and in the Pacific and Indian oceans. It is taken casually at all seasons on the eastern coast of the United States, but becomes numerous irregularly in summer, when its presence or absence seems to be governed largely by the movements of its principal food, the menhaden (q.v.), when seeking their inshore spawning-grounds. The only wonder is that both have not been exterminated many centuries ago, for of all the butchers of the sea the bluefish is the most wolfish and diabolical, snapping its prey in half for a mouthful and passing on in ruthless industry. It is beautifully shaped for swimming, built with the fine lines of the mackerel and the strength of the salmon. It is a near relative of the pompanos and horse-mackerels (family *Carangidae*), but is set apart in a family (*Pomatomidae*) by itself, which Jordan considers an offshoot toward the percoids. In color it is steel-blue, and its flesh is very sweet and savory. The weight varies, five pounds being the common run, although 20 pounds are recorded.

The favorite method of fishing for it is "squidding," or casting from a platform built out into the surf, with a rod and line armed with a spoon, or a bone-baited hook. Its voracity makes it a free biter, and its temperament makes it a fierce one, so that the angler may expect a fight from the strike to the death, and only by sheer strength can the prey be landed. The bluefish is also trolled for from boats, especially in Florida, and off the south coast of New England.

On our Pacific coast the "California bluefish" (*Cynoscion parvipinnis*) is found from Santa Barbara to Guaymas and Mazatlan, and is a near relative of the eastern weakfish (q.v.), locally called "totuava" (*Cynoscion macdonaldi*). In the Gulf of California it congregates at the mouth of the Colorado River and attains enormous size, having been taken in hand-lines as high as 170 pounds. Like other species of this genus, it is erroneously yet frequently called "sea-bass." The bluefish thrives on sardines and other small fish. Assuming that one bluefish eats 10 small fish a day, it has been figured that it requires ten thousand million sardines to feed

the one thousand billion bluefish on our coasts every summer.

Consult Jordan and Evermann, 'Food and Game Fishes of America' (1902); Goode, 'Fishery Industries, Section 1' (10th census, Washington, 1884); Mayer (editor), 'Sport with Rod and Gun' (1892).

Bluegowns, an order of paupers in Scotland, called also the "King's Bedesmen," to whom the kings annually distributed certain alms on condition of their praying for the royal welfare. Their number was equal to the number of years the king had lived. The alms consisted of a blue gown or cloak, a purse containing as many shillings Scots (pennies sterling) as the years of the king's age, and a badge bearing the words "Pass and repass," which protected them from all laws against mendicity. Edie Ochiltree, who figures prominently in Scott's novel 'The Antiquary,' is a type of the class, but probably a favorable specimen as compared to those who were to be met with in real life. The practice of appointing bedesmen was discontinued in 1833, and the last of them drew his last allowance from the exchequer in Edinburgh in 1863.

Bluethroat, an Old World bird (*Cyanecula suecica*) related to the European robin, and deriving its name from its bright blue throat, which is separated from the white below it by crescent-shaped bands of rust-red and white. It is one of the most highly migratory birds known, spending its winters in tropical Africa and India, and during the summer breeding in Scandinavia, northern Russia, Siberia, and western Alaska. It makes its nest in bushes and weeds along streams, as far north as 71 degrees. It is extraordinary in never being seen in the intermediate countries, between its summer and winter homes, so that it stands to reason that the journey is made at a single flight, either at night, or at an invisible altitude. The bluethroat is celebrated for its fine singing, and powers of mimicry when in its summer home, on account of which the Laplanders call it "the bird of the hundred voices." Consult Gätke, 'Birds of Heligoland' (English translation 1895); and works on European, Siberian, and Alaskan ornithology.

Bluewing, a duck. See TEAL.

Bluffs, a term of American origin, synonymous with cliffs. It has long been used to designate the high cliffs met with along the Mississippi River; particularly those abrupt banks of loam on its eastern side below the mouth of the Ohio. These are continually washed and undermined by the action of the river, while the opposite side, rising more gently back from the river, is but slightly washed by its waters. On the south shore of Lake Superior, near the Pictured Rocks, is a most remarkable bluff of loose, blowing sand, which rises so steeply from the edge of the water to the height of 200 feet, that one would in vain endeavor to ascend it. The waves and the winds beat against it from the north, and keep its materials continually in motion; but more sand appears to be always supplied to replace that which is borne away.

Bluing, a compound dissolved in water to whiten clothes after washing. The indigo preparation once largely used has been extensively superseded by Prussian blue.

BLUING OF METALS—BLUMENTHAL

Bluing of Metals, the process of giving a blue color to metallic substances by heat. Iron, when heated, becomes first of a light, then of a darker gold color, and finally blue. Steel heated to redness and suddenly cooled, is rendered hard and brittle. It is restored to any degree of softness, by heating it up to certain temperatures and allowing it to cool slowly. These temperatures are precisely indicated by the color of the film of oxide which forms upon its surface. At 430° F. it is straw yellow of the very hard temper suitable for lancets. At higher temperatures it appears successively a golden yellow, then brown, purple, blue, and finally green. Pale blue at 550° is the temper for swords and watch springs. The common shade of blue, at 560°, is the temper for fine saws and dirks. Deep blue, at 600°, is the soft quality of steel for large saws.

Blum, blün, Ernest, French dramatist: b. Paris, 15 Aug. 1836. Either alone or in collaboration with other dramatists he is the author of many highly successful plays. The drama of 'Rose Michel' (1877), of his own composition, insured his place among the most successful French dramatists of the time. Among his later compositions are 'Adam and Eve' (1886); 'The Nervous Woman' (1888); 'End of the Century' (1890); 'La rieuse' (1894); 'Le Carillon' (1897).

Blum, Hans, hänts bloom, German publicist: b. Leipsic, 1841. He is a son of Robert Blum (q.v.), was educated in the universities of Leipsic and Bern, sat in the North German Reichstag 1867-70, and was a barrister in Leipsic 1869-97. He has written extensively on contemporary politics and among his works are 'Die Lügen unserer Socialdemokratie' (1891); 'Fürst Bismarck und seine Zeit' (1894-5); 'Das erste Vierteljahrhundert des deutschen Reichs' (1896); 'Persönliche Erinnerungen an den Fürsten Bismarck' (1900). He has also written two dramas and several novels.

Blum, bloom, Robert, German patriot: b. Cologne, 10 Nov. 1807; d. Vienna, 9 Nov. 1848. He served for a short time in the army, and became subsequently connected with the Leipsic Theatre, of which he acted for some time as secretary and treasurer. About the year 1840 he began to come prominently forward as the champion of the Liberal cause, and acquired much renown as a popular orator. On the outbreak of the commotions of 1848 he manifested great enthusiasm, and became soon the rallying-point of democracy in Saxony, and the leading member of opposition in the National Assembly at Frankfort, to which he was sent that year as member for Leipsic. The events of October at Vienna inspired him with fresh energy, and he proceeded thither at the head of a deputation to express the sympathy of the German democrats in the Frankfort Assembly with the Viennese. He took an active part in the conflict of the citizens with the imperialists; but on the surrender of the capital to Windischgrätz, was arrested with several of his companions on 4 November. Brought before a military tribunal, he pleaded in vain his privileges as a deputy from the German diet, and was condemned to be hanged, a sentence which was changed to death by the bullet.

Blum, blüm, Robert Frederick, American artist: b. Cincinnati, Ohio, July 1857. He

studied at the Philadelphia Academy of Fine Arts, and among his works are 'Venetian Bead Stringers,' which received a prize of \$2,500 at the American Art Association exhibition in New York in 1889. Although he has worked in oils he is best known as a water-colorist and painter in pastels. He is ranked among the most brilliant of American water-color artists.

Blumenbach, Johann Friedrich, yō'hän frēd'rih bloo'mēn-bah, German naturalist of distinction: b. Gotha, 11 May 1752; d. Göttingen, 22 Jan. 1840. He studied at Jena and Göttingen, and was appointed in the latter, in 1776, extraordinary professor of medicine and inspector of the museum of natural history, and in 1778 ordinary professor. In 1812 he was appointed secretary to the Royal Society of Sciences at Göttingen, in 1816 became physician to the king of Great Britain and Hanover, in 1821 was made a knight-commander of the Guelphic Order, and in 1831 was elected a member of the Academy of Sciences at Paris. In 1825 the jubilee of his graduation as doctor was celebrated. On this occasion a medal was struck, and an endowment founded under the name of the Blumenbach Stipendium or Bursary, to assist talented young physicians and naturalists, and enable them to make scientific travels. In 1835 he retired from public life. The first work which brought him into notice was the 'De Generis Humani Varietate Nativa,' and from its publication in 1775 he continued almost for 60 years to exert a powerful influence on the progress of science, both by the number of distinguished pupils who were indebted for their first training to his admirable lectures, and by his valuable writings, partly inserted in the 'Transactions' of scientific societies, and partly published as separate works. Among the latter, in addition to the thesis, which received important additions in subsequent editions, and may be said to have given a direction to the most important studies of his after life, are the 'Institutiones Physiologicae' (1787), long a textbook in many of the most celebrated schools of Europe; the 'Handbuch der vergleichenden Anatomie' (Handbook of Comparative Anatomy), and 'Collectio Craniorum Diversarum Gentium.' The last work gives descriptions and figures of his collection of skulls, one of the most extensive in existence, and still preserved at Göttingen. In regard to the important subject of which it treats, Blumenbach held decidedly that the human race formed only one species, and had originally descended from a single pair; but he divided it into the five varieties of Caucasian, Mongolian, Negro, American, and Malay.

Blumenreich, Franziska, fränts'is-ka bloo'mēn-rīh, German novelist: b. Bohemia, 2 April 1849. Among her very numerous novels the more notable are 'At the Abyss of Marriage' (1888); 'Freighted with Bliss' (1890); 'Storms in Port' (1892). She is a zealous advocate of woman's rights.

Blumenthal, Jacob von, yā'kōb fōn bloo'mēn-tāl, German pianist and composer: b. Hamburg, 4 Oct. 1829. Going to London in 1849, he became pianist to Queen Victoria, taught music, and was soon well known as a composer of popular pianoforte numbers and equally popular songs such as 'My Queen'; 'The Venetian Boat Song'; 'The Broken

Flower'; 'The Bend in the River.' The familiar hymn tune, 'Blumenthal,' is an adaptation of his composition, 'The Two Angels.'

Blumenthal, Oskar, ös'kär bloo'mën-täl, German dramatist and critic: b. Berlin, 13 March 1852. Sprightliness of dialogue is the most distinguishing character of his plays; the most successful of them are 'The Big Bell'; 'A Drop of Poison'; 'The Black Veil.' He has published several volumes of critical and miscellaneous essays.

Blundell, (Mrs.) Francis (M. E. FRANCIS), English novelist: b. Dublin. She is the widow of Francis N. Blundell and has lived for many years in Lancashire, but more recently in Dorsetshire. Her writings, which have steadily increased in popularity, both in England and the United States, are: 'Whither?' (1892); 'In a North Country Village' (1893); 'The Song of Dan' (1894); 'Town Mice in the Country, a Story for Children' (1894); 'A Daughter of the Soil' (1895); 'Frieze and Fustian' (1896); 'Among the Untrodden Ways' (1896); 'Maime o' the Corner' (1897); 'Miss Erin' (1898); 'The Duenna of a Genius' (1898); 'Yeoman Fleetwood' (1899); 'Pastorals of Dorset'; 'Fiander's Widow' (1901); 'North, South, and Over the Sea'; 'The Manor Farm' (1902).

Blundell's School, a famous English free grammar school in Tiverton, Devonshire, founded in 1604 by Peter Blundell, who left his fortune to charities, the school being the most important of his benevolences. In connection with it five Balliol College scholarships were founded and many persons who afterward became eminent went to Balliol College, Oxford, from Tiverton School. The school is mentioned in the novel 'Lorna Doone' as the scene of John Ridd's early education. In 1880 new buildings in the Tudor style were built for the school in the outskirts of the town. The late archbishop of Canterbury, Frederick Temple, was a student at Blundell's School.

Blunderbuss, a short, heavy, large-bored firearm, often brass-barrelled, and bell- or trumpet-mouthed. It was used to discharge a heavy load of slugs or small bullets at a short range, and was once generally employed as a weapon for the defense of houses against burglars. As a military weapon, it was used occasionally on shipboard for repelling boarders, or pouring heavy volleys into boats, when attempting to cut vessels out from anchorage. It is now wholly disused. See SMALL ARMS.

Blunt, Edmund March, American author: b. Portsmouth, N. H., 20 June 1770; d. Sing Sing, N. Y., 2 Jan. 1862. He is remembered for his publication of the 'American Coast Pilot' (1796), describing all the coasts of the United States, and containing a vast amount of invaluable information for seamen. More than 30 editions of this work have been published, and it is still in use in the United States and the principal European countries, having been translated into nearly every foreign language. He also compiled a number of nautical books and charts.

Blunt, George William, American hydrographer: b. Newburyport, Mass., 11 March 1802; d. New York, 19 April 1878; a son of Edmund March Blunt (q.v.). He went to sea when 14 years old and served as a sailor till

nearly 21; and in 1822-66 was a publisher of charts and nautical books in New York. He made original surveys of many American harbors; was one of the committee that organized the present system of pilotage for New York; made several revisions of the 'American Coast Pilot'; and was influential in causing the Federal government to adopt the French system of lighthouses and to organize the Lighthouse Board.

Blunt, James G., American soldier: b. Trenton, Maine, 1826; d. Washington, D. C., 1881. He settled as a physician in Anderson County, Kansas, in 1856; became prominent in the contest over the introduction of slavery into that State, and was a member of the convention that framed its constitution. Entering the army as lieutenant-colonel of the 3d Kansas Volunteers, he became brigadier-general, 8 April 1862, and was assigned to the command of the military department of Kansas. As such he was engaged in the battle of old Fort Wayne, defeated Marmaduke at Cane Hill, Ark., and, with the aid of Gen. Herron, defeated Hindman at Prairie Grove, and thus checked the Confederate advance into Missouri. He was promoted major-general, 29 Nov. 1862, and in October 1864 gave the final blow to Price's invasion of Missouri.

Blunt, John Elijah, English consular agent: b. 14 Oct. 1832. He entered the English consular service in 1850, and held various consular posts in Turkey, receiving in 1862 and again in 1868 the thanks of the President of the United States for his services to American citizens in the province of Adrianople. Since 1899 he has been consul at Boston, Mass., with the rank of consul-general.

Blunt, John Henry, English High Church theologian: b. London, 25 Aug. 1823; d. there, 11 April 1884. He held various curacies, and in 1873 was appointed to the living of Beverston, Gloucestershire. He wrote much, among his chief works being: 'Dictionary of Doctrinal and Historical Theology' (1870); 'Dictionary of Sects, Heresies, etc.' (1874); 'History of the English Reformation' (1868-82); 'Household Theology' (1865); 'Annotated Book of Common Prayer' (1866; revised and enlarged, 1884).

Blunt, John James, English divine: b. Newcastle-under-Lyme, 1794; d. Cambridge, 18 June 1855. From 1839 he was Lady Margaret professor of divinity at Cambridge. His works include: 'Sketch of the Reformation in England' (1832); 'Undesigned Coincidences in the Old and New Testament, an Argument for their Veracity' (1847); 'On the Right Use of the Early Fathers' (1857); 'History of the Church During the First Three Centuries' (1856); several volumes of sermons; etc.

Blunt, Stanhope English, American military officer: b. Boston, Mass., 29 Sept. 1850. He was graduated at the United States Military Academy and commissioned 2d lieutenant in 1872; rose through the ranks to major in the ordnance department; served at various posts and arsenals in the West; was a member of several boards, including that which selected the Krag-Jorgensen rifle for use in the army; and had command of the Rock Island Arsenal,

III. He has written 'Firing Regulations for Small Arms,' and numerous papers on the use of small arms.

Blunt, Wilfrid Scawen, English poet and traveler: b. Crabbet Park, Sussex, 17 Aug. 1840. He was attaché of legation at The Hague, Athens, Madrid, Buenos Ayres, and elsewhere; supported Arabi Pasha in the revolt in Egypt in 1881; and was imprisoned in 1888 for his insurrectionary actions in Ireland. He is author of: 'Sonnets and Songs by Proteus' (London 1875); 'The Love Sonnets of Proteus' (1881); 'The Future of Islam' (1882); 'The Wind and the Whirlwind,' political poems (1884); 'Ideas About India' (1885); 'In Vinculis' (1889); 'A New Pilgrimage' (1889); 'Esther: a Young Man's Tragedy' (1892); 'Stealing of the Marc' (1892); 'Griselda' (1893); 'Satan Absolved' (1899).

Blunthead, a columbrine snake of Java and the East Indies (*Amblycephalus monticola*). It is about three feet in length, and purple in ground color, but this is almost entirely concealed by the brown markings and mottlings, and the cheeks and lip-plates are carnation-red. It is perfectly harmless, and is welcomed by the natives to their houses as a vermin-destroyer. It owes its name to the squarish form of the head, which, as in many other species of the family, looks so much like that of a poisonous snake as to deceive most observers.

Bluntschli, Johann Kaspar, yō'hān kās'par blünt'shle, Swiss jurist and statesman: b. Zurich, 7 March 1808; d. Carlsruhe, 21 Oct. 1881. He became professor in the newly founded university in that city in 1833; took an active part in the political struggles that divided his country, and at first inclined to the party of reform, until the events of 1839 induced him to join the Conservatives, of whom he was, for a time, a leader. He was a councilor of state, and became a member of the government and of the Federal Directory, and afterward worked for the formation of a moderate Liberal Conservative Party in Switzerland. In 1848 he went to Munich as professor of civil and international law. There he published his 'Allgemeines Staatsrecht' (5th ed. 1876), on which his reputation as a jurisconsult chiefly rests; 'Deutsches Privatrecht' (3d ed. 1864); and, in conjunction with Arndts and Pözl, 'Kritische Ueberschau der Deutschen Gesetzgebung und Rechtswissenschaft' (6 vols. 1853-8). In 1861 he removed to Heidelberg University, and became a privy councilor of Baden, actively forwarding all Liberal measures in the state. Liberty in ecclesiastical matters he had equally at heart; he acted several times as president of the Protestantenverein, and it was after delivering a closing speech at the general synod of Baden that he died suddenly at Carlsruhe. He was the author of valuable histories of Zurich and of the Swiss Confederation, and of a number of works on law, being especially an authority in international law. His library is now possessed by the Johns Hopkins University at Baltimore.

Blushing, a sudden reddening of the face, caused by a rush of blood into the capillary vessels of the skin. A blush is excited by confusion of mind, arising from surprise or diffidence, modesty or shame, or conscious guilt and apprehension, showing the influence of the

passions and emotions on the nervous system and the circulation of the blood. Sudden fear and apprehension cause the blood to rush from the external surface to the internal organs, leaving the bloodless lips quite pale, and the whole face suffused with deathly pallor. It is a kind of inverse blushing; the one being a sudden flash of color in the face, the other a sudden flash of paleness.

Blüthgen, August Eduard Viktor, ow'-goost ēd'oo-ārd vik'tor blüt'-gēn, German novelist: b. Zörbig, near Halle, 4 Jan. 1844. He has won high distinction as a writer for the young. Among his stories for boys and girls are: 'The Rogues' Looking Glass' (1876); 'The Battle of Frogs and Mice' (1878); and with these is to be classed the letter-press (verses) of O. Pletsch's 'Picture Books.' Of novels and romances he is author of a great many; for example, 'The Peace Breaker' (1883); 'The Step-Sister' (1887); 'Madame the Countess' (1892); etc.

Blyden, Edward Wilmot, a negro author: b. St. Thomas, W. I., 3 Aug. 1832. After vainly seeking, in 1845, admission to some college in the United States, he went to Liberia, and graduated at the Alexander High School, of which he afterward was principal. In 1880 he became president of Liberia College, has held important government positions, and was commissioner to the Presbyterian General Assembly of the United States in 1861 and 1880. He is proficient in many languages, including Latin, Greek, Spanish, Hebrew, and Arabic. He has published: 'Liberia's Offering' (1873); 'From West Africa to Palestine' (1873); 'The Negro in Ancient History'; etc.

Blythe, Herbert. See BARRYMORE, MAURICE.

B'nai B'rith, b'nī b'rēth, **Independent Order of the**, an association of German Jews formed in the United States in 1843. Its purpose is the moral improvement of the members. Its organization resembles that of the Free Masons, but it is not a secret society, and has no elaborate ceremonial. The organization has since been established in Germany, and in the East. In 1901 it had over 400 lodges and 28,000 members.

Bo-tree, the sacred fig of India. See PEEPUL.

Boa, a serpent of that section of the family *Boidæ* called *Boinæ*. The boas are mostly of great size, and inhabitants of the forests of tropical America; and, with the pythons, constitute a family of the largest of modern snakes, which are noted for their power to enfold and fatally crush their prey in muscular coils. These serpents are notable not only for great size, but for certain structural peculiarities, of which the most noteworthy and characteristic is the fact that vestiges remain of the pelvis and hinder limbs, which appear externally as claw-like spurs on each side of the vent, which are of service in hanging from trees. The muscular power is very great, the tail is partly prehensile; and the bones of the head, and especially of the jaws, are more than ordinarily loosely joined together (see SERPENT), so that bodies surprisingly large may be swallowed. This family is distributed throughout all tropical regions, and is divided into two sub-families, by diversities of structure. One (*Pythoninae*) con-

tains the Old World pythons (q.v.), which have a pair of supraorbital bones, some teeth on the premaxilla, and the sub-caudal scales in two rows; while the boas lack supraorbital bones, never have premaxillary teeth and but a single row of scales on the under side of the tail. Most of the 40 or 50 species of *Boia* are American, but several small species inhabit the warmer parts of the Old World. Several of the American boas are very large snakes, perhaps occasionally reaching 30 feet in length, though few carefully measured have exceeded 20 feet; but such a one would weigh several hundred pounds, and be a very formidable foe to the largest animals exposed to their attacks. They inhabit the forests, and climb to the lower branches of the trees, where they seek or await their prey, usually above a path. There the serpent swings about in the air till some luckless animal approaches; then, suddenly relinquishing its position, he seizes the victim, and coils his body spirally round its throat and chest, till, after a few ineffectual cries and struggles, the animal is suffocated, and expires. In producing this effect, the serpent does not merely wind itself around its prey, but places fold over fold, as if desirous of adding as much weight as possible to the muscular effort; these folds are then gradually tightened with enormous force, and speedily induce death. The animals thus destroyed by the larger boas are sometimes as large as tapirs, deer, and even bullocks, but ordinarily the much smaller mammals and birds of the forest, while one species feeds mainly upon aquatic prey. Having crushed and rolled its prey until its bones are broken into pieces, and it is compacted into the form of a sausage, it takes it into its mouth, and at first by the help of the strong recurved teeth on its jaw bones, and later by reflex movements of its throat and ribs slowly engulfs it, the action being facilitated by a copious flow of saliva; but there is no truth in the reputed preparation of the prey by a covering of slime, etc., related in so many books. The process of digestion is slow, and while it is proceeding, the snake is inert, and easily caught and killed.

Several of the larger species are well known and often seen in menageries, where they are easily distinguished by the shape of the head and by the well-defined pattern of the markings. These are exceedingly handsome in most cases, the colors being yellow, buff, chestnut, and varying browns, set off by black and white; and the skins, which may be tanned into good leather with the scales on, are of high commercial value for making purses, belts, and other ornamental articles. Among the best known species are the common boa — the *Boa constrictor* proper (for that term is ignorantly given to all), which is one of the lesser forms, rarely exceeding 10 feet in length. Its home is the region of the Amazon and Orinoco rivers, and it is pale brown, with a chain-like series of dark-brown markings on each side of the spine, enclosing large oblong-oval spots, and a series of large dark spots along the sides, each with a light centre; on the tail the markings become brick-red. Several other species of this genus, some much larger, inhabit South and Central America. One, the imperial boa, has a Mexican variety, often called the *abonia*, which is believed to be the serpent venerated by the ancient Mexicans, and worshipped with bloody sacrifices. Two species of

true boas also inhabit Madagascar. Of a closely related genus is the great water-boas, or anacondas (*Eunectes nuerinus*), which adds to the arboreal habits of the others the custom of crawling into the rivers and swamps of the half-flooded forests, where it lives, and there lying in wait for animals that come down to drink, or seizing those of semi-aquatic life. This is the largest, most formidable, and one of the handsomest of the tribe. Many species are of smaller size, down to only three feet in length, but all have similar habits. One genus (*Lichanura*) has a few species that dwell in the West Indies and Mexico, and are occasionally taken in Arizona and southern California; and small boas of this or an allied sort are frequently brought into the United States from Cuba, tightly coiled about bunches of bananas. They are harmless, of course, unless of a great size, having no poison sacs or fangs, and all the larger ones are susceptible of taming, and seem to acquire a positive regard for their human friends.

Boabdil, bō-ab-dēl', or **Abu-Abdullah**, ā'boo-ābd-ool'ah, last Moorish king of Granada. He gained the throne in 1481 by expelling his father, Mulei Hassan; but being attacked by Ferdinand of Aragon, was defeated and taken prisoner. His father having resumed his crown, Ferdinand set Boabdil at liberty, and promised to assist him against his father, on condition of his agreement to become the vassal of Spain. He accepted the ignominious condition, and his father died of a broken heart. Boabdil was not permitted to reign in peace. By his tyranny he provoked the hostility of his own subjects, and Ferdinand, taking advantage of the dissensions which prevailed, laid siege to Granada. The Moors made a valiant defense, and were prepared to bury themselves under the ruins of the city, but Boabdil capitulated, and retired to a domain of the Alpujarras assigned him by the victor (1491). When on his way he turned round to take a last look of the city, and burst into tears. "Right, my son," exclaimed his mother, Aixa, who was standing by him, "weep like a woman for the throne which you had not the spirit to defend as a man and a king." The spot is still called "El Ultimo Sospiro del Moro" (the last sigh of the Moor). (See GRANADA.) Boabdil soon afterward passed into Africa, and fell in battle while assisting the king of Fez in an attempt to dethrone the king of Morocco.

Boadice'a, queen of the Iceni, a British tribe, inhabiting what are now the counties of Cambridgeshire, Suffolk, Norfolk, and Hertfordshire. She died about 62 a.d. The celebrated earthworks still extant, known as the Devil's ditch, at Newmarket heath, and at Six-Mile-bottom, are supposed to be the fortifications of this tribe, and perhaps of this queen, against the Romans. She was a contemporary of Nero, and was a woman of remarkable character, both for firmness and ability. Her husband, the king of the Iceni, Prasutagus, dying, left Nero and his own two daughters joint heirs to his great wealth, hoping thereby to preserve his family and kingdom from the rapacity of the conquerors. But immediately on his death his kingdom was taken possession of by the Roman centurions. For some real or imaginary offense, the British queen was pub-

1. Boa Constrictor.

2. Dog-Headed Boa (*Niphosoma Caninum*).

lily scourged by the executioner, and her daughters were abandoned to the lust of the slaves. Stung to frenzy by this outrage, taking advantage of the absence of Suetonius Paulinus, the Roman governor, from that part of England, Boadicea raised the whole military force of her barbarians, and bursting upon the Roman colony of London, reduced the city to ashes, and put to the sword in that and neighboring places,—of Roman citizens, traders, Italians, and other subjects of the empire,—at least 70,000 individuals. Suetonius lost not a moment in hurrying to the scene of action, although it was well known that the queen of the Iceni was in command of 120,000 men, which gradually increased to 230,000, according to Dion Cassius, while he could bring into the field in all less than 10,000 soldiers. It is true that absolute credit cannot be given to statements of prodigious numbers, such as the above, but at all events the disparity of force was extraordinary. The legion, posted on heights, where its flanks and rear were covered by woods, seems to have received the attack passively, sheltered from the missiles of the Britons by their large, oblong bucklers, until, when the darts and arrows of the barbarians began to fail, by one compact charge they carried all before them. They spared nothing; women, children, the beasts of burden, the dogs, were all cut to pieces. It is said that 80,000 Britons were butchered that day, while of the legionaries only 400 fell, and about as many more were wounded. It is believed that the action took place not far from St. Albans, Verulamium, a Roman colony, which at the first irruption had shared the fate of London. The queen, seeing that her cause was lost, committed suicide, rather than submit to the conqueror. Beaumont and Fletcher's play, 'Boadicea,' is founded upon the resistance made by Boadicea against Suetonius.

Boanerges, bō-ā-nēr'jēz, an appellation given by Christ to two of his disciples, the brothers James and John, apparently, on account of their fiery zeal. See Mark iii. 17.

Boar, Wild, a ferocious, swift-footed species (*Sus scrofa*) of wild swine, made dangerous by its extreme courage and superior strength. It is found in marshy forest-grounds of Europe, Asia Minor, and North Africa. The boar is much larger than the domesticated swine; and covered with short, grayish-black, woolly hair, thickly interspersed with stiff bristles, assuming the form of a crest along the spine. The great tusks of the lower jaw are formidable weapons in youth, but later becoming useless by curving over the snout, when the teeth of the upper jaw which protrude and curve out take their place as weapons. The boar seeks its food at night and feeds on roots, grain, and small animals, birds' eggs, etc. Besides this species, several others exist, notable among which are *Sus vittatus* of Asia and Africa, *Sus verrucosus* of Java, and the Celebes and *Sus barbatus* of Borneo. Boars were common in England until the time of Henry II., when they seemed to disappear for the time being, reappearing again in the reign of Charles I. Formerly the sport of hunting this animal with the aid of great dogs (boarhounds), was the favorite amusement of the nobles of France and Germany, but is now rarely followed except

in a few estates in eastern Europe, where the animal is preserved for the purpose. In India, however, the chase of the wild boars of that country, usually called "pig-sticking," is still foremost among the field-sports of the Anglo-Indians.

Board, the collective name applied to a number of persons having the management, direction, or superintendence of some public or private office or trust; often an office under the control of an executive government, the business of which is conducted by officers specially appointed, as board of admiralty, board of trade, etc.

Boardman, George Dana, American missionary: b. Livermore, Me., 8 Feb. 1801; d. 11 Feb. 1831. He studied at Andover and was ordained in the Baptist Church. In 1825 he went to India, and in 1827 to Burma, where he labored assiduously in spreading Christianity. The mission planted by him became the central point of all Baptist missions in Burma.

Boardman, George Dana, American clergyman and author: b. Tavoy, British Burma, 18 Aug. 1828; d. Atlantic City, N. J., 28 April 1903; son of the American Baptist missionary of the same name. He was educated in the United States, graduating at Brown University in 1852, and at Newton Theological Institution in 1855. He was pastor at Barnwell, S. C.; afterward at Rochester, N. Y., till 1864, when he became pastor of the first Baptist Church in Philadelphia. In 1899 he established a lectureship at the University of Pennsylvania, known as the "Boardman Foundation in Christian Ethics." Besides sermons and essays, his chief works are: 'Studies in the Creative Week' (1878); 'Studies in the Model Prayer' (1879); 'Epiphanies of the Risen Lord' (1879); 'Studies in the Mountain Instruction' (1880); 'The Kingdom' (1899); 'The Church' (1901); 'The Golden Rule' (1901).

Boardman, Richard, English missionary: b. 1738; d. Cork, Ireland, 4 Oct. 1782. He became a member of Wesley's conference in 1763, and volunteered for service in America in 1769. He preached in New York and through the Middle States till 1774, and then, returning to England, continued his itinerant ministry. He is known as one of the founders of Methodism in the United States.

Boarfish, a fish of the family *Caproidæ*, found off the southern coast of Europe. The body is small, oval, compressed, and carmine in color, with seven transverse orange bands on the back, and has a long, hog-like snout.

Boarhound. See HOUND.

Boar's Head, The, a tavern in Eastcheap, London, destroyed in the great fire of 1666; its site is now occupied by a statue of William IV. The inn figures in Shakespeare's 'Henry IV.' and 'Henry V.' as the resort of Falstaff and his boon companions.

Boas, Franz, fränts bō'as, German-American ethnologist: b. Minden, Westphalia, 9 July 1858. He studied at Heidelberg, Bonn, and Kiel universities, 1877-82; traveled in the Arctic regions, 1883-4; was assistant in the Royal Ethnographical Museum in Berlin, and privat docent in geography at the University in 1885-6; and teacher of anthropology in Clark University,

BOAT — BOBADILLA

Worcester, Mass., in 1888-92. In 1901 he became curator of the American Museum of Natural History. He has spent much time among various American Indian tribes, and, among other works, has published 'Baffin Land' (1885); 'The Central Eskimo,' in the 'Annual Report' of the United States Bureau of Ethnology (1888); 'Indians of British Columbia' (1888-92); etc.

Boat, properly a small vessel propelled by oars or poles. Boats are made of iron, copper, India-rubber, gutta-percha, skins, and of all kinds of wood. Wooden boats are usually built either smooth or lap-streak, that is, where the upper plank laps over the next lower. Boats differ much in shape and size, depending on the use to which they are to be put. Launch is the largest boat carried by a man-of-war. Long boat, used by merchant vessels for conveying heavy burdens; this name is given to the largest boat, without regard to size. Cutter, shorter and lighter than the launch, and much faster. Jolly boat, smaller than the cutter, and not so fast, used for going on shore, usually rowed with four oars. Gig, a fast-rowing boat nearly the size of the cutter, employed both in the merchant service and navy. Barge, in the English navy, about the size of the cutter. This name is given to the large boats used on occasions of state. On the Mississippi it means a scow, flat-bottomed, and of very light draught. Sometimes also applied to the large 8- and 10-oared race boats. Pinnace, smaller than the barge, used for conveying light articles. In the English navy the pinnace launch is next in size to the launch. Paddle-box boat, so called from the place where they are stowed, commonly built like a whale boat, and smaller than the cutter. Whale boat, a sharp, light boat, very wide amidships, bow and stern alike, rowed with six oars. All surf boats are whale-boat model, or modifications of it. Dory, light, flat-bottomed, very sharp, with sloping sides, from 15 to 20 feet long, used very extensively in the fisheries. Wherry, in the United States, a dory; in England, a race boat for one rower, and from 15 to 30 feet long. Skiff, a little boat for crossing rivers, or going on shore from a vessel. Cobble, a small fishing boat, flat-bottomed. Punt, a flat-bottomed, decked boat, of very light draught, used chiefly by gunners. Shallop, small ship's boat; term not now used. Scow, a broad flat-bottomed boat, with square bow and stern, for conveying heavy weights, propelled by poles or sweeps, from 30 to 50 feet long, and 12 to 18 feet wide. Canal boat, a broad shallow boat, like the scow, except in having a keel and a rather sharper bow, used only on canals. Flats, flat boats, arks, etc., boats resembling scows, save in being decked. They are still to be found on the Mississippi and its tributaries, and are used for bringing all kinds of produce down the river. Bateaux, boats smaller than the scow, and used in the same way. Gondola, in the United States, a scow; properly, a very sharp, fast boat, sculled with one oar. Moses, large flats, used in the West Indies for taking molasses hogsheds from shore to ship. Felucca, a large boat with lateen sails, decked, and rowing from 10 to 16 banks of oars. Life-boats, boats used in storms for saving life. (See LIFE-BOAT.) Dingy, a wooden life-boat, carried by a man-of-war, has

wooden air-chambers at each end, and is about 18 feet in length. Waist boats and quarter boats take their name from the part of the vessel where they are kept, and are somewhat smaller than the cutter. Race boats differ very much in shape from any of those before named. Having only speed in view, they are built as light, narrow, and sharp as possible. They are rowed with from 2 to 12 oars, and are from 15 to 70 feet in length, and generally not more than eight inches above water. The two-oared boats are called shells, sculls, or wherries; the larger ones sometimes barges.

Boatbill, a South American heron (*Cancroma cocklearia*), having a remarkable bill, suggesting in its broad, inflated shape an up-turned boat, the keel of which is represented by the ridge of the culmen. The bird is about the size of a night-heron, but with shorter legs. Its general color is reddish-gray, with black and white markings. The back of the head and neck are covered with elongated, erectile feathers. A naked gular pouch hangs beneath the lower jaw. It feeds upon worms, crabs, and other small aquatic animals caught in muddy shallows. Another species (*Cancroma zelendom*) inhabits Central America.

Boat-fly (*Notonecta glauca*), an aquatic hemipterous insect which swims on its back; the hind-legs aptly enough resembling oars, the body representing a boat; hence the name. It frequents stagnant waters, swimming rapidly on the surface, but diving below whenever the water is disturbed. In color it is gray and black, with greenish elytra and white wings. The small insects which constitute its food are devoured in very large numbers. The female usually deposits the eggs on the stems and leaves of aquatic plants.

Boatswain Bird, or Marlin-spike, either of two species of a sea-wandering bird, so called because of the long, pointed feathers in its tail, which resemble a marlin-spike, the boatswain's badge of office. One is the skua-gull (*Stercorarius parasiticus*), and the other a tropic bird (q.v.).

Bo'az, a wealthy Bethlehemite, who took upon himself the duty of providing for Ruth, as the near relation of her dead husband, Elimelech. From him Jesus Christ was directly descended.

Bob-white. See QUAIL.

Bo'bac, a European and Central Asian gregarious marmot (*Arctomys bobac*), resembling the American woodchuck in habits and appearance, but smaller.

Bobadilla, Francisco de, från thës'kō dé bō-bā-dēl'yā. Spanish soldier: d. 29 June 1502. In the year 1500 he was selected as a commissioner to enquire into the condition of the new Spanish colony of Hispaniola, and especially into the complaints which had been made against the administration of Columbus (q.v.). He was entrusted with unlimited powers, which he immediately exercised by arresting Columbus, putting him in chains, and sending him to Spain. He next abolished the regulations which had been enacted by Columbus, and indulged the colonists in all the excesses of power, and, above all, in boundless oppression of the natives. The unexpected outrage upon the most noted man of the time excited general

WILD BOARS (*Sus scrofa*)

indignation in Spain, and was regarded as a national dishonor. Orders were accordingly sent for the recall of Bobadilla, and when Columbus, now reinstated in his honors and emoluments, made his fourth landing in Hispaniola, the fleet bearing Bobadilla and other enemies of Columbus started for Spain. A fearful tropical hurricane wrecked the ships, and Bobadilla perished.

Bobbin, a reel or other similar contrivance for holding thread. It is often a cylindrical piece of wood with a head, on which thread is wound for making lace; or a spool with a head at one or both ends, intended to have thread or yarn wound on it, and used in spinning machinery (when it is slipped on a spindle and revolves therewith) and in sewing-machines (applied within the shuttle).

Bobbinet, a lace, with a hexagonal eyelet, manufactured by machinery, in imitation of the lace made on a pillow.

Bob'bio, Italy, a small town in the province of Pavia, the seat of a bishop, with an old cathedral, and formerly a celebrated abbey founded by St. Columbanus, in the library of which was a famous collection of manuscripts now divided between the Vatican and the Ambrosian Library at Milan. The population of the commune is about 5,000.

Boboli (bō'bō-lē) **Gardens**, the grounds of the Pitti Palace at Florence, planned in 1550 by Eleanor of Toledo. They contain many fine statues and the Isoletto fountain, designed by Jean de Bologne.

Bobolina, bō-bō-lē'nā, a heroic Greek woman; d. 1825. Her husband was put to death at Constantinople in 1812 by order of the Sultan, and Bobolina vowed revenge. At the beginning of 1821 she fanned the flames of insurrection among the Greek population in Turkey, equipped at her own expense three ships, herself taking command of one bearing her flag, as admiral, and giving the others to competent captains, while her two sons fought against the Turks on land. In September 1821 she attended the siege of Tripolitza, to meet the Peloponnesian leaders there assembled. She put her ships at the disposal of the government and maintained the blockade of Nauplia for 14 months, until the Turks were forced to capitulate. She then proceeded, with a small Greek fleet, which was entrusted to her charge, to the coasts of Morea, and during the siege of Monemvasia, when one of her nephews lost his life, she did not even waste one hour upon him, but quietly drawing a cloak over his body, avenged his death by continuing to bombard the city. After the war she lived with her brothers at Spezzia. In 1825 her house was attacked by the friends of a young lady who was supposed to have been dishonored by some member of her family, and she was killed by a rifle shot fired by one of the assailants.

Bob'olink, an oriole of the family *Icteridae*, found in plains, prairie-lands, meadows, and cultivated fields throughout the entire United States, except on the Pacific coast. The male is 7.7 inches long, its tail taking up fully half of its length. It is distinguished from the black-birds and other orioles by its pointed tail-feathers, long middle toe, and variegated plumage. The male has two distinct sets of plumage, a summer or breeding dress, and a winter one.

The former dress is lustrous black, with the neck, scapulars, rump, and upper tail coverts buff, inclining to ochraceous on the neck, and ashy on the tail; the latter is similar to that of the female, who is protectively clothed in much-streaked yellowish-brown neutral tints; the young of both sexes also resemble her, until the young males reach maturity. The gay summer dress of the male, especially the black part, is due to the black margins upon the feathers that come in with the spring renewal of plumage. These edges wear away, and thus, as the season advances, the brownish centres of the feathers are gradually revealed. The song of the male is a varying melody, an incessant out-pour of ecstatic music, in which one detects distinctly enunciated the word "bob-o-link." Its excited manners are as peculiar as its song, which often bubbles out of its beak as it flutters and dances in mid-air. As the summer advances and the plumage changes, the song diminishes, and finally ceases altogether.

Their nests consist of grasses neatly and skilfully entwined, and ingeniously hidden among the stems and leaves of plants, and are guarded carefully and most jealously by the male, whose exuberant pride in the four or five dull-white, flecked, and marbled eggs is remarkable. The bobolink goes in summer as far north as the banks of the Saskatchewan, but is most plentiful in the northeastern States, where it renders good service by the destruction of insects and their larvæ. It begins to migrate southward in August, and assembles in huge flocks in early autumn in the great wild-rice marshes that border Delaware and Chesapeake bays and their rivers, where they fatten on the wild rice, and are shot in vast numbers for market, under the name of "reedbird." Later in the season these birds advance southward and assail the cultivated rice plantations, where they are known as rice-birds and would ruin the crops, partly by eating, but mainly by breaking the stalks and shaking out the grain, were they not constantly killed or scared away by thousands, by men and boys who are employed to shoot them. On their return from the tropics in the spring they also attack the young plants. In consequence of this necessary persecution in the rice fields the species has been seriously diminished of late years, and bobolinks are becoming rare in many parts of the United States and Ontario. On account also of their beauty and powers of song, many are caught, caged, and sold in the bird-stores.

Bobruisk, bō-brōō'sk, Russia, a fortified town in the government of Minsk, on the right bank of the navigable Beresina, at its junction with the Bobruisk, 108 miles southeast of Minsk, with which it is connected by rail. By steam navigation it is connected with stations on the Dnieper and the Beresina. The chief exports consist of timber and grain. The place was fortified by Alexander I., and the defenses were extended by Nicholas I., who raised it to the position of a fortress of the first rank. In 1902 an extensive conflagration nearly destroyed the town. Pop. (1902) 26,000.

Bobs, a nickname given by English soldiers to Gen. Lord Roberts (q.v.).

Bocaue, bo-kow-a, Philippines, a town in the province of Bulacan, Luzon, situated a few miles east of Manila Bay, near the city of Bulacan, and near the railroad line.

Boccaccino, Boccaccio, bōk-kāchō bōk-kā-chē'nō, Italian painter: b. Cremona, 1460; d. 1518. Few details of his life are known. He came under the influence of Mantegna, and in his school in Cremona numbered Benvenuto Garofalo among his pupils. In 1497 he painted a series of frescoes in St. Agostino in his native city, but he is better known by his frieze in the cathedral. This represents the birth of the Virgin and various incidents in her life. Among his paintings are: 'Marriage of St. Catharine,' in the Venice Academy; 'Virgin and Two Saints,' in San Quirilo, Cremona, and a 'Holy Family,' in the Louvre, Paris. He committed suicide.

Boccaccio, Giovanni, jō-vān'ne bōk-kāch'ō, Italian novelist: b. 1313, in Paris or Florence; d. Certaldo, 21 Dec. 1375. His family was originally of Certaldo, but his father being engaged in commerce, removed to Florence, where he amassed wealth, and filled several important public offices. Very early in life Giovanni displayed a remarkable aptitude for learning, and before he was seven years old, composed verses with perfect facility. He was placed under the care of an eminent master, Giovanni da Strada, but his father having determined on a commercial career for his son, removed him from his tutor before his Latin course was completed, and as soon as he had acquired a sufficient knowledge of arithmetic apprenticed him to a merchant, with whom he remained six years. His master finding that he profited nothing, although he made in his company several commercial journeys, finally in despair sent him back to his father, and was accustomed to regard him as a very narrow-minded youth. His father discovering that his son would never make a merchant, thought that his studious habits might serve him in the legal profession. But the law proved as distasteful as commerce, and the father, finding that the law had little attraction for Giovanni, forced him to return to commerce, and fix his residence in Naples. The king, Robert of Anjou, a friend and patron of Petrarch, was greatly devoted to literature, and thus drew to his court the most eminent scholars of Italy. Boccaccio was well acquainted with Giovanni Barrili, a man of erudition, and Paolo of Perugia, the king's librarian, and excited by their example and encouragement, he entirely abandoned commerce and gave himself up to the pursuit of learning. His father gave his consent only on the condition that he should study the canon law, and although against his disposition, he applied himself to it for some time, took his doctor's degree, and after that found himself more at liberty to indulge his passion for poetry, while at the same time he devoted himself to the higher branches of philosophy, astrology, then a favorite study, and to the fathers of the Church. He remained eight years in Naples, and during his stay there was filled with desire of distinction by the visit of Petrarch on his way to Rome, where he had been decreed the honor of the laurel crown. Boccaccio marked with delight the splendid reception given to Petrarch, his examination of three days, his noble oration, and the applause which followed, but was far more pleased in after years to make the acquaintance of the illustrious poet, with

whom he formed a life friendship. Boccaccio was naturally fond of gay company, and fell in love with the princess Mary, illegitimate daughter of King Robert, and half-sister of the celebrated Joanna of Naples. She was married to a Neapolitan gentleman, but at once ardently returned Boccaccio's love and became his avowed mistress. At her instance, he composed his romance of 'Il Filocopo,' and 'L'Amorosa Fiammetta,' in the latter of which his lady, under the name of Fiammetta, bewails the loss of Pamphilo, supposed to represent himself. The 'Filocopo' is not skilfully constructed, and is filled with spectres and visions of every kind, and the powers of darkness are summoned before the reader to account for its scenes and incidents. Yet it contains passages of that wondrous grace and vivacity afterward so signally displayed in the 'Decamerone,' and touches of human nature in which the whole character is pictured in a single sentence. While thus employed at Naples he was suddenly summoned to Florence by the illness of his father. His separation from the princess Mary appears to have affected both lovers with violent sorrow, and it was only by the composition of the romance of 'Ameto' that he could console himself during his absence. His father's recovery and marriage set him again at liberty to return to the favors of his adored princess. He was not only happy from his connection with the princess Mary, but possessed the favor of Acciajuoli, who had great power in Naples, and even the regard of Queen Joanna herself. It is asserted on respectable authority that many of the most licentious passages in the 'Decamerone' were written in conformity with the taste and by the command of the queen. His father died in 1350, leaving a son by his wife Bice dei Bosticchi, who was also dead, to the care of Boccaccio. The poet faithfully attended to his trust, and becoming acquainted with Petrarch, the latter's example and influence began very shortly to act upon the mind of his younger friend, who from the date of their friendship commenced to turn his thoughts more from licentious pleasures to purer fame. Being now permanently settled in Florence, Boccaccio, by Petrarch's advice, began to take some interest in the affairs of state. His motives were appreciated, however, and he was sent on an embassy to Padua, to invite Petrarch to accept the presidency of the university. Several other missions followed, and in April 1353, he took part in one to Pope Innocent VI., the papal court then residing at Avignon. In the same year was published his 'Decameron' or '10 Days' Entertainment,' one of the most extraordinary works of genius ever written, and which after the lapse of five centuries is still regarded as one of the purest specimens of Italian prose, as an inexhaustible repository of wit, beauty, and eloquence, although unhappily deformed with licentious descriptions. While occupied with these popular compositions, Boccaccio did not lose sight of higher pursuits in literature. Like Petrarch he was a devoted collector of ancient manuscripts, and a diligent student of the classics. On one occasion Boccaccio visited Monte

Cassino, within whose monastery he knew many works had been collected, which had escaped the ravages of the barbarians, but found, to his amazement, that they were suffered to rot in a damp loft exposed to the weather, and that frequently when the monks were in want of money, they took some of the manuscripts, obliterated the writing, replaced it by copying on the parchment some part of the ritual, and then sold the new productions among the people of the neighborhood. To such collectors as Petrarch and Boccaccio, and to the latter pre-eminently, the world owes a debt of gratitude for the rescue of many of the great classic works which otherwise would have been irretrievably lost. In 1359 the author of the Decameron visited Petrarch at Milan, conversed with him, as he informs us, at great length on the subjects of morality and religion, and determined to devote himself more seriously to holy studies. This resolve received additional stimulus in 1362 from a singular circumstance. A monk from the Carthusian monastery at Sienna came to visit him, saying that he was charged with a message to him from Father Petroni, who on his death-bed, although he had never seen Boccaccio, declared that he knew him in spirit, and commissioned the monk to exhort him to repentance. In order to prove the truth of his words, the monk told Boccaccio of a circumstance in his life which the poet thought known only to himself. So great was the effect of this warning, that he determined to abandon poetry, sell his library, and lead a life of penance and meditation. With this view he wrote to Petrarch, supposing that his sudden purpose would meet with kindred enthusiasm, but his friend answered in a strong, common-sense letter, instructing him to receive the warning to repentance, but informing him that there was no necessity for selling his books or abandoning his studies. Boccaccio accordingly wrote in a strain altogether free from his former one, while he assumed the ecclesiastical habit, and applied himself to theology. With disinterested generosity a large part of his means was dissipated in the collection of Greek manuscripts, his emissaries visiting many parts of Europe to procure them. His fortune was thus gradually impaired, and toward the decline of life he found himself poor and deserted by all his friends, except the noble-minded and constant Petrarch. That great poet wished his friend to take up his abode with him, but Boccaccio preferred independence, and declined the offer, although he visited Petrarch whenever he found an opportunity. In 1363 he was invited to Naples by the grand seneschal Acciajuoli, but was so hurt by his cold reception, that he soon left and went to Venice to meet Petrarch. On returning to Florence he found its turbulent state of society in little accordance with his wish of retirement, and took up his abode in a little cottage in Certaldo, in the vale of Elsa, dear to him as the birthplace of his family. From this retreat he was soon summoned by the chief citizens of Florence, to undertake an embassy to Urban V. at Avignon, and repairing to the papal court he experienced the most flattering reception. He was again sent

to Urban in 1367, after the pontiff had removed to Rome, when the character of Boccaccio had so completely changed from his former looseness, that he was characterized by the bishop of Florence as one in whose purity of faith he had the utmost confidence. He was now honored by the Florentine magistrates with a professorship founded in memory of Dante, for the better explication of the 'Divina Commedia.' His lectures commenced in October 1373, and continued until his death, which was doubtless hastened by the demise of Petrarch 10 months before his own. In eloquent language he bewailed his loss. Boccaccio wrote numerous works in Italian and Latin, and both in prose and poetry, few of which are referred to at the present day; his great fame rests upon the Decameron. In these hundred tales of love, displaying the most wondrous fertility of invention, the reader is perpetually delighted with the beauty of the narrative and the variety of the scenes, whether of intrigue, wit, or pathos—no two stories, nor even their introductions, resembling each other. The author's fondness for involving friars in every imaginable scene of mischief and ludicrous mishap, created great scandal to the Church, and his famous romance, the tenth novel of the sixth day, in which "Friar Onion promises some country people to show them a feather from the wing of the angel Gabriel, instead of which he finds only some coals, which he tells them are the same that roasted St. Lawrence," drew down the solemn anathema of the council of Trent. The editions of the Decameron are almost innumerable, and translations exist in all the languages of Europe. The earliest editions are extremely rare, and of that of Valdarfer in 1471, only one copy is known. Boccaccio's poem, 'Il Teseide' is written in the *ottava rima*, of which he is usually considered as the inventor, and is the first Italian poem which presents a specimen of the *epopee*. Chaucer borrowed from this poem his 'Knight's Tale,' and Shakespeare a part of his 'Midsummer Night's Dream.' The great English dramatist has also, in some measure, availed himself of Boccaccio's Decameron, as in 'Cymbeline' and 'All's Well that Ends Well.' With all his faults, we may consider Boccaccio one of the great revivers of learning and a benefactor to mankind, as well as worthy of the third place in that great triumvirate with Dante and Petrarch, "which renders the 14th century so splendid an epoch in the history of literature." See Cochin, 'Boccaccio, études italiennes' (1890), Symonds, 'Giovanni Boccaccio as Man and Author' (1895).

Boccage, Marie Anne Fiquet du, mā-rē ān fē-kā dū bōk-kāzh (LE PAGE) French poetess: b. Rouen, 22 Nov. 1710; d. there, 8 Aug. 1802. She was educated in Paris, in a nunnery, where she discovered a love of poetry. Her first published work, a poem on the mutual influence of the fine arts and sciences, appeared in 1746, and gained the prize from the Academy of Rouen. She next attempted an imitation of 'Paradise Lost,' in six cantos; then of the 'Death of Abel'; next, a tragedy, 'The Amazons'; and a poem in 10 cantos, called 'The Columbiad.'

Madame du Boccage was praised by her contemporaries with an extravagance for which only her sex and the charms of her person can account. *Forma Venus, arte Minerva*, was the motto of her admirers, among whom were Voltaire, Fontenelle, and Clairaut. There is a great deal of entertaining matter in the letters which she wrote on her travels in England and Holland. She was a member of the academies of Rome, Bologna, Padua, Lyons, and Rouen. Many of her works have been translated into English, Spanish, German, and Italian.

Boccanera, Simone, sê-mō'nā bōk-kā-nā'rā, first doge of Genoa: d. 1363. He was born of an illustrious noble family, but early took part with the democratic party and gained great popularity by undertaking the defense of the people against the nobles. During a commotion caused by the severity with which Philip of Valois had punished a mutiny on board some Genoese galleys in the service of France, the people wished to appoint Boccanera their abbé, an office which appears to have been similar to that of the tribunes at Rome. Boccanera declined to accept, on the ground that his noble birth would not allow him to become a plebeian magistrate. The excuse only made the people more determined to place him at their head and as he would not be abbé they by acclamation hailed him doge. The office, thus introduced into Genoa for the first time in 1339, was exercised by Boccanera till 1344, when the ascendancy of a faction opposed to him obliged him to abdicate and retire to Pisa. He afterward regained the office in 1356, and had held it for seven years, when his enemies succeeded in destroying him by poison.

Boccherini, Luigi, loo-ē'jē bōk-kā-rē'nē, Italian composer of instrumental music: b. Lucca, 14 Jan. 1740; d. Madrid, 28 May 1805. He received his first instruction in music and on the violoncello from his father and the Abbé Vannucci, music-master of the archbishop. He further improved himself in the art at Rome, and afterward went, with Filippo Manfredi, his friend and countryman, to Spain, where he met with but indifferent patronage, and latterly suffered greatly from indigence. Previous to 1797 the king of Prussia, Frederick William II., who was a great lover of the violoncello and admired Boccherini's compositions, had paid him a pension on condition of his sending him yearly some of his quartets and quintets. The compositions which Boccherini published himself consist of symphonies, sêstets, quintets, quartets, trios, duets, and sonatas for the violin, violoncello, and pianoforte. He never composed anything for the theatre; and of church compositions we find but one, his 'Stabat Mater.' The adagios of Boccherini excited the admiration of the connoisseurs and the despair of the composers of his time. He may be regarded as a sort of minor Haydn, and he was the first who wrote instrumental quartets, of which all the parts are *obbligato*, and determined the true character of this species of music. His melodies are more highly esteemed in England, France, and Spain than in Germany.

Bocchetta, bōk-kēt'tā, Italy, a pass of the Apennines, leading from Lombardy to Genoa, and traversed by the road from Novi. In the Austrian war of succession (1746-7), and in the

French wars toward the end of the 18th century, it was the scene of several important events.

Bocconia, or **Plume Poppy**, a genus of four or five species of plants of the natural order *Papaveraceae*. *P. cordata*, a native of Japan and China, is the only species of special merit. It is a hardy perennial herb with large leaves similar to those of bloodroot, and small usually pinkish apetalous flowers borne in large terminal panicles rising like spires from four to eight feet above the dense foliage. Where known, it is a favorite in borders and shrubberies and is also largely used upon lawns for its remarkable appearance. It is very much sought by bees, and should prove a valuable bee-forage, since it will thrive almost anywhere. It is readily propagated by seeds, divisions of the root, and by suckers. If set in rich soil the plants will attain the greatest size and attractiveness.

Bochart, bō-shār, Samuel, French divine: b. Rouen, 1599; d. Caen, 16 May 1667. He was son of a Protestant minister descended from an illustrious family, and gave proof of precocious talents by composing, at the age of 14, a Greek poem in praise of his master, Thomas Dempster, who was so much pleased with it that he published it at the head of his work on Roman antiquities. He afterward studied philosophy and theology at Sedan, visited England and Leyden, and, returning to France about 1628, became Protestant minister of Caen, a post which he held till his death. Shortly after, a Jesuit of the name of Veron, who had been specially trained to controversy, and had received a diploma entitling him to travel the country and debate the points of difference between the Protestant and Roman Catholic churches, challenged Bochart to a discussion. It took place in 1629, in the castle of Caen, in presence of the Duc de Longueville, governor of Normandy, and a large assemblage of nobility and gentry, and had continued for 11 days, when Veron, without waiting to bring it to a close, judged it prudent to take his departure. The debate was published by Bochart under the title of 'Actes de la Conférence Tenue à Caen.' His next work, entitled 'Geographia Sacra seu Phaleg et Chanaan,' added so much to his reputation that Christina, queen of Sweden, sent him a letter in her own hand, inviting him to Sweden. He accepted the invitation, and had for his traveling companion the celebrated Huetius, afterward Bishop of Avranches, and author of an excellent work on the Christian evidences, entitled 'Demonstratio Evangelica.' On his return to Caen in 1653 he learned that an academy had been founded there in his absence. He immediately joined it, and was afterward one of its most distinguished members. Bochart's next great work is entitled 'Hierozoicon, or an Account of the Animals mentioned in Scripture.' It was scarcely completed when its distinguished author, while addressing the academicians of Caen, was struck with apoplexy and died almost instantaneously. His health had previously given way under grief for the loss of a daughter, his only child. Besides the works above mentioned, he wrote several others, among which is a 'Letter to Dr. Morley,' written, it is said, at the request of King Charles II., and discussing three important questions—De Presbyteratu et Episcopatu; De Provocatione a Judiciis Ecclesiasticis; De

Jure et Potestate Regum. Bochart's principal works are still standards on the subjects of which they treat.

Bochnia, bōh'nē-a, Austria, a town in the government of Lemberg, Galicia, near the Raba, 25 miles east-southeast of Cracow. It is tolerably well built, with several churches, a gymnasium, a grammar and other schools, and a board for the regulation of mines and saltworks. The salt mines here employ 500 persons, and yield 15,000 tons per annum. Pop. about 9,000.

Bochum, bōh'oom, Prussia, a town in the government of Arnsberg, province of Westphalia, five miles east-northeast of Essen and between 20 and 30 miles northeast of Düsseldorf. It is on the railway from Dortmund to Duisburg, and has manufactories of iron, steel, hardware, carpets, tobacco, etc. Pop. (1895) 65,980.

Bock, Jerome, German botanist, better known under his Latin name of *CRAGUS*: b. Heidesbach, 1498; d. Harnbach, 1554. He was a schoolmaster, and then a physician. Bock may be considered as one of the founders of modern botany; he was the first who endeavored to form a natural botanical arrangement. He is the author of a *Herbal of German Plants*.

Bock, Karl Ernst, German anatomist: b. Leipzig, 1809; d. 1874. He studied at the University of Leipzig and at the outbreak of the Polish revolution he went to Warsaw, where he acted as hospital physician, first in the Polish service and later in the Russian. On his return home he was elected extraordinary professor in the University of Leipzig. His works attained popularity and have been translated. His title to fame rests chiefly on his '*Handbook of Human Anatomy*.'

Bock Beer, a strong beer, the first drawn from the vats in the spring, when the winter's brew of lager beer is broached. See **BEER**; **BREWING**.

Böcklin, bērk-lin, Arnold, German painter: b. Basel, 16 Oct. 1827; d. 1901. He studied at the Düsseldorf Academy and also at Brussels, Paris, and in Italy, devoting himself mostly to landscape painting. A contract to decorate the dining-hall of a villa summoned him to Hanover; in 1856 he went to Munich, where Count Schack became his patron. In 1858 he became teacher in the art school at Weimar; in 1866-71 he was in Basel; in 1871 he returned to Munich and lived also in Zurich and Florence. He is in the first rank of landscape painters, showing a real poetic power and wealth of coloring, yet his most poetical conceptions in landscape painting are often marred by the figures introduced. Among his most notable paintings are '*Venus Reposing*'; '*Pan in the Rushes*'; '*Castle by the Sea Surprised by Corsairs*'; '*Villa by the Sea*'; and '*The Isle of the Blessed*.'

Bocland, Bockland, or Book-land, one of the original English modes of tenure of manorland which was held by a short and simple deed under certain rents and free services. This species of tenure has given rise to the modern freeholds.

Böcskay, böch'kō-e, Stephen, Hungarian national leader: b. 1556; d. 1606. In 1604, when the Emperor Rudolf II. attempted to suppress

Protestantism in Hungary, a rebellion broke out, and Böcskay joined the malcontents and became their leader. He was well supported by the people, drove back the emperor's troops, and was made Prince of Transylvania. In 1606 he concluded the Peace of Vienna with the emperor, and this secured religious freedom to Hungary for a long time.

Bode, Johann Ehlert, yō'hän ä'lert bō'da, German astronomer: b. Hamburg, 19 Jan. 1747; d. 23 Nov. 1826. He gave the first public proof of his knowledge by a short work on the solar eclipse of 5 Aug. 1766. The approbation which this received encouraged him to greater labors, and in 1768 appeared his '*Introduction to the Knowledge of the Starry Heavens*' (9th ed. 1822). In 1772 the Berlin Academy chose him their astronomer, and 10 years afterward he was made a member of that institution. His best works are his '*Astronomical Almanac*' (commencing 1774),—a work indispensable to every astronomer,—and his large '*Celestial Atlas*' in 20 sheets, in which the industrious editor has given a catalogue of 17,240 stars (12,000 more than in any former charts). In 1825 he was released, at his own wish, from his duties in the Academy of Science and the observatory in Berlin. His place was filled by Professor Encke. His empirical law as to the distance of the planets is well known. See **BODE'S LAW**.

Bode's Law, an empirical law formulated by the German astronomer Bode (q.v.) to give the arithmetical relation subsisting between the distances of the planets from the sun. It may be thus stated: Write, in the first instance, a row of fours, and under these place a geometrical series beginning with 3, and increasing by the ratio of 2, putting the 3 under the second 4; and by addition we have the series 4, 7, 10, etc., which gives nearly the relative distances of the planets from the sun.

4	4	4	4	4	4	4	4	4	4
	3	6	12	24	48	96	192	384	
4	7	10	16	28	52	100	196	388	

Thus, if 10 be taken as the distance of the earth from the sun, 4 will give that of Mercury, 7 that of Venus, and so forth. The actual relative distances are as follows, making 10 the distance of the earth:

Mercury	Venus	Earth	Mars	Asteroids	Jupiter	Saturn	Uranus	Neptune
3.9	7.2	10	15.2	27.4	52.9	95.4	192	300

Close as is the correspondence between the law and the actual distances, no physical reason has been given to account for it, although there is little room for doubt that such exists. Kepler was the first to perceive the law, and Bode argued from it that a planet might be found between Mars and Jupiter, to fill up the gap that existed at the time in the series. The discovery of the planetoids has proved the correctness of this prediction.

Bodenstedt, Friedrich Martin von, frē'drīn mär-tēn fōn bō'dēn-stēt, German poet and miscellaneous writer: b. 1819; d. 1892. He studied at Göttingen, Munich, and Berlin, and became tutor to the young Prince Gallitzin at Moscow. Having obtained an educational appointment at Tiflis he published a work on the peoples of the Caucasus (1848), and '*A Thou-*

sand and One Days in the East' (1849-50), which were very successful. In 1854 he was appointed professor of Slavic at Munich, and in 1858 was transferred to the chair of Old English. He subsequently was theatrical director at Meiningen, and traveled and delivered lectures in the United States. Among the best of his poetical works are the 'Songs of Mirza-Schaffy,' purporting to be translations from the Persian, but really original, which have passed through more than 150 editions. He published translations from Marlowe, Ford, Webster, and other contemporaries of Shakespeare, translated Shakespeare's 'Sonnets,' and with other writers joined in a new translation of Shakespeare's dramatic works (1866-72, 9 vols.).

Bodie, or **Body's Island**, an island of sand between the Atlantic Ocean and Albemarle and Roanoke sounds. The sand shifts often, and inlets from the ocean appear and disappear. There is a lighthouse with a first-class light on the island.

Bodieron, bō-dī-ē'rōn, a fish (*Hexagrammus lagocephalus*) of Puget Sound, similar to the rock-trout (q.v.), but having greenish-colored flesh.

Bodin, Jean, zhōn bō-dān, French political writer: b. Angers, 1529 or 1530; d. Laon, 1596. He studied law at Toulouse; delivered lectures on jurisprudence there, and afterward went to Paris and practised. Being unsuccessful in his profession, he turned his talents to literary labors; was invited by Henry III. to his court; and afterward traveled with the king's brother, Francis, Duke of Alençon and Anjou, to Flanders and England, where he had the gratification of hearing lectures in Cambridge on his work, 'De la République,' originally written in French, but afterward translated by Bodin himself into Latin. He died of the plague.

Bodkin, Matthias M'Donnell, Irish novelist and journalist. He has written 'Poteen Punch'; 'Pat o' Nine Tales'; 'The Rebels'; 'White Magic'; etc.

Bod'kin, (1) an instrument used by women of ancient times to fasten the hair, worn at the back of the head; (2) a sharp instrument for piercing holes in cloth; (3) a blunt instrument with an eye, for drawing tape, etc., through hems; (4) a small tool used by printers.

Bodle, a copper coin formerly current in Scotland, of the value of two pennies Scotch, or the sixth part of an English penny. It is said to have been so called after a mint master named Bothwell.

Bodleian (bōd-lē'an) **Library**, the public library of the University of Oxford, so called from Sir Thomas Bodley (q.v.) who restored it toward the close of the 16th century, many of the previous collections of books and manuscripts having been destroyed during the reign of Edward VI. Beside restoring the building and providing a fund of \$10,000 for the purchase of books, he also presented a collection which was valued at \$50,000, and left an estate for the maintenance of officers and for keeping the library in repair. For the government of the library he drew up some statutes, which were afterward incorporated with those of the University. The library was first opened to the public 8 Nov. 1602. The liberal example of Bodley was soon followed by the Earl of Essex, who

presented part of the Portuguese bishop Osorius' library, which had been captured by Essex in 1596, shortly after the expedition against Cadiz. After the death of Bodley, the Earl of Pembroke added a valuable collection of Greek manuscripts procured by Baroccio, a Venetian. At later dates Sir Thomas Roe, Sir Kenelm Digby, the "learned Selden," Gough the antiquary, and Archbishop Laud, made donations of valuable Greek, Oriental, and German manuscripts to this magnificent library. The library of the Hebrew scholar Oppenheim, rich in rabbinical lore, a great collection of Eastern manuscripts, of early editions of the Bible, original editions of ancient and classic authors, together with 50,000 dissertations by members of foreign universities, and an extensive collection of medals, coins, prints, etc., were also subsequently deposited in this library. In 1809, Clarke, the traveler, gave to it some rare Greek and Latin manuscripts, including a 'Plato' from the Isle of Patmos. In 1818 an exceedingly valuable collection of Hebrew, Greek, and Arabic manuscripts procured from Venice, was added, together with a portion of the famed library of Richard Heber (1834), and lastly, the rare books, manuscripts, and coins of the scholar, antiquary, and Shakespearean commentator, Francis Douce. This renowned library, in fine, is rich in many departments in which other libraries are deficient, and forms altogether the noblest collection of which any university can boast. It is constantly increasing by donations, by copies of every work printed in the United Kingdom, as well as by books purchased from the fund left by Bodley, by fees received at matriculation, and by an annual payment of all persons (servitors excepted) who have the right of admission to the library. It is now estimated to contain upward of 500,000 bound volumes, and between 30,000 and 40,000 manuscripts. The first catalogue of the printed books was issued by Dr. James in 1605.

Bodley, Sir Thomas, English scholar, and founder of the Bodleian Library (q.v.) at Oxford: b. Exeter, 1544; d. London, 1612. He was educated partly at Geneva, whither his parents, who were Protestants, had retired in the reign of Queen Mary. On the accession of Elizabeth they returned home, and he completed his studies at Magdalen College, Oxford. He afterward became a Fellow of Merton College, and read lectures on the Greek language and philosophy. He went to the Continent in 1576, and spent four years in traveling. He was afterward employed in various embassies to Denmark, Germany, France, and Holland. In 1597 he returned home and dedicated the remainder of his life to the re-establishment and augmentation of the public library at Oxford. This he accomplished, procuring books and manuscripts himself, both at home and abroad, at a great expense, and by his influence and persuasion inducing his friends and acquaintances to assist in his undertaking. Sir Robert Cotton, Sir Henry Savile, and Thomas Allen the mathematician, were among the principal contributors on this occasion. The library was so much augmented that Sir Thomas Bodley, who was knighted at the accession of James I., was induced to erect an additional structure for the reception of

the increasing quantity of valuable books and manuscripts. He was interred in the chapel of Merton College, in the university. He bequeathed nearly the whole of his property to the support and augmentation of the library. See 'Reliquiæ Bodleianæ' (London, 1703).

Bodmer, Georg, gā-orh bōd'mār, Swiss mechanic: b. Zürich, 6 Dec. 1786; d. Zürich, 29 May 1864. He invented the screw and cross wheels; and made valuable improvements in firearms and in various kinds of machinery, particularly in that of wool-spinning.

Bodmer, Johann Jakob, yō'hän yä'kōb, German poet and scholar: b. Greifensee, near Zürich, 19 July 1698; d. Zürich, 2 Jan. 1783. Although he produced nothing remarkable of his own in poetry, he helped to open the way for the new German literature in this department, which was then in a low and barbarous state. He was the antagonist of Gottsched in Leipsic, who aspired to be the literary dictator of the day, and had embraced the French theory of taste, while Bodmer inclined to the English. He has the honor of having had Klopstock and Wieland among his scholars. Bodmer was for a long time professor of history in Switzerland. He was a copious and indefatigable writer, though he entertained many incorrect views.

Bodoni, Giambattista, jām-bāt-tēs'tā bō-dō'nē, Italian printer: b. Saluzzo, Piedmont, 1740; d. Padua, 29 Nov. 1813. His father owned a printing establishment at Saluzzo, and he began, while yet a boy, to employ himself in engraving on wood. His labors meeting with success, he went in 1758 to Rome, and was made compositor for the press of the Propaganda. By the advice of the superintendent he made himself acquainted with the Oriental languages, in order to qualify himself for the kind of printing required in them. He made himself of great service to this press by restoring and putting in place the types of several Oriental alphabets which had fallen into disorder. The Infante, Don Ferdinand, about 1766, had, with a view of diffusing knowledge, established a printing-house in Parma, after the model of those in Paris, Madrid, and Turin. Bodoni was placed at the head of this establishment, which he made the first of the kind in Europe, and gained the reputation of having far surpassed all the splendid and beautiful productions of his predecessors in the art. The beauty of his type, ink, and paper, as well as the whole management of the technical part of the work, leaves nothing for us to wish; but the intrinsic value of his editions is seldom equal to their outward splendor. His Homer is a truly admirable and magnificent work; indeed, his Greek letters are the most perfect imitations of Greek manuscript that have been attempted in modern times. His splendid editions of Greek, Latin, Italian, and French classics are highly prized. He was a member of several academies of Italy and knight of several orders.

Body and Mind, in philosophy, the problems of the reality of mind and body, and of

the relations conceived to exist between them. Mind and body, positing temporarily their reality, may first be regarded from the point of view of correlated action. Generally experience reveals indisputably the intimate relation which exists between the constitution and modifications of bodily functions and the character and alterations of consciousness. Consider the following: the dependence of certain forms of consciousness upon the functioning of the senses; modifications due to injury by a blow, on lesion in the cerebral cortex; effect of loss of sleep upon attention; effect of the use of certain drugs; pleasures and pains resulting from functioning of sense; feeling of effort which accompanies bodily work; the phenomena of sleep; diseases of memory and will, double personality; phenomena of hypnotism, hallucination, etc.; the evidence from heredity, sexual differences, and other allied phenomena. All these, as facts, afford an indisputable conclusion concerning the correlated action of mind and body.

But difficulties arise as soon as we undertake to state the nature of the relations which exist between them. The general truth which the phenomena referred to appear to establish, that every psychosis has its concomitant neurosis and every neurosis a concomitant psychosis, is not entirely borne out in fact. The former part of the statement is indubitable; the latter by no means so. Mental activity always involves nervous activity, but the nervous system does work other than that connected with mind. Moreover the precise interconnections of mental fact with cerebral fact, and *vice versa*, is not only not known, but the specific character of the neurosis concomitant with the psychosis is perhaps impossible of final analysis. But until these phenomena are understood, the nature of the relations of body and mind cannot be finally determined. However, physiological psychology has successfully established certain general conclusions concerning the existence of uniform relations between concomitant psychical and neural processes. The most obvious of these is the time-order or synchronous occurrence of the two series of events. The remainder are concerned, in the main, with variations of intensity, quality, combination, and complexity. Qualitative psychical differences, however, are not accompanied by corresponding differences of molecular movement. These are quite different from the corresponding sensational differences.

Philosophical systems, from the days of Greek thought (see ANAXAGORAS; ARISTOTLE) down to the present, have taken up the problem where psychology leaves off. These systems may be divided into dualism and monism. According to dualism, the first and crudest theory of which was promulgated by Descartes, both mind and body are real existences, and their relations must accordingly be determined. The problem assumes two forms, the epistemological and the genetic. According to the former of these a knowledge of both body and mind is posited. Various theories concerning their interaction then arise, such as the causal relation, parallelism, pre-established harmony, and occasionalism. The first of these is not only the most important, but the philosophical conceptions concerning it may be said to strike

at the inmost heart of the problem, and their assumption determine the acceptance or rejection of general theories. Physiological psychology has demonstrated the temporal concomitance of the psychosis with the intermediate central portion of the neurosis. But we have certain neuroses revealing physiological processes devoid of conscious concomitant. Now, the question arises: How may this partial parallelism be accounted for? Is there a causal relation such as our initial phenomena seemed to indicate, or have we only the appearance of it in a general parallelism? Science has failed to afford precise answers to these questions. According to it the series of nervous events is complete in itself and self-sufficient. Hence, since antecedent events fully account for consequent ones, consciousness can have no causal action upon the neural series. Consciousness, then, is a mere accident and without determining power in any series. This gives us the doctrine of human automatism, according to which all our nervous actions are determined, and consciousness is an unnecessary attachment. On the other hand, others regard psychical phenomena as having a reality equal to that of physiological phenomena. They acknowledge, generally, the conditioning effect of nervous processes upon mental ones, but they divide again on the question of the reality of causal connection. Finally the genetic view traces its distinction of mind and body upon the dualism which a developmental theory in general appears to demand; or it accepts it as an hypothesis, uncritically examined, but convenient for practical purposes.

It is the attempted unification of mind and body which brings us to the doctrine of monism. Under this general theory we find spiritual monism, materialism, pansychism, epiphenomenon, mind-dust, etc. The most obvious means of reconciliation is that of resolving either one of the ultimate factors into the other. The metaphysical conception of materialism is the doctrine by which all substance whatsoever is conceived of as being reduced to matter, of which conscious mind is but a product. The chief objections urged against it are: (1) that it makes our mental states, which of all knowledge we know most immediately and directly, subordinate to our indirect and inferential knowledge of things; (2) that consciousness is a reality distinct from material phenomena, and therefore incapable of being analyzed into it; and (3) that no external world is possible apart from a perceiving subject. Spiritualism, on the other hand, escapes these objections by positing mind as the primordial substance, and further regarding material things as in themselves essentially expressive of spirit. It encounters, however, certain difficulties in the concomitance and juxtaposition of its elements for which, as yet, it has afforded no adequate solution.

According to Spinoza's doctrine of monism, both spirit and matter, or the mental and the material, are posited as real, self-existent realities, but not standing independent of each other. There is a common "substance," and in this, consciousness and extension, the fundamental attribute of external reality, find themselves connected. Hence the doctrine is neither purely materialistic nor purely spiritualistic, but in-

cludes both these theories. The parallelism which physiological psychology demonstrates, then, in the two classes of phenomena, indicates not only their ultimate inseparability, but the fact that they are but different modes of manifestation of a common substance. Manifestly, then, this doctrine calls for no interaction theory and disposes of the troublesome question of causal connection above referred to. There is no interaction, merely a parallelism. This parallelism, indeed, extends throughout all material objects, all of which thus assume a certain *mental* aspect also. It is at this point especially that monism parts company, in its speculation, from the teachings of non-speculative psychology, according to which mind and consciousness are invariably co-extensive.

Body Color, a term applied to such pigments as have body enough to be opaque, as distinguished from those which are transparent. As a rule, pigments have more body the nearer they approach to white; consequently the light parts of pictures in oil are in body color to give them brightness and strength, while the dark parts are transparent to give them depth. Water color painting, when executed by mixing the pigments with water after the manner of an oil painting, is said to be painted in body color.

Boece, **bois**, **Boeis**, or **Boyce**, **Hector**, Scottish historian: b. Dundee, about 1465; d. 1536. Boece studied at Dundee, and then at the University of Paris, and became professor of philosophy in the College of Montaigu. Here he became acquainted with Erasmus, who professed a high esteem for him. About 1500 Boece quitted Paris to assume the principality of the newly founded University of King's College, Aberdeen. He was also made a canon of Aberdeen. The death of his patron in 1514 occasioned his first work—a history of the prelates of Mortlach (the original see) and Aberdeen, including the life of Bishop Elphinstone, which occupies about a third of the volume. It has been reprinted by the Bannatyne and New Spalding clubs. Five years afterward appeared the work on which his fame chiefly rests, the 'History of Scotland.' The first edition is without date, but a commendatory epistle bears the date of 1527. It was written in Latin. He is distinguished by a patriotic zeal to magnify the achievements of his countrymen, and by an enlightened love of political liberty in advance of the age in which he lived. In 1527 Boece received an annual pension of 50 pounds (Scots), which was to be continued "until the king should promote him to a benefice of 100 marks Scots of yearly value." The pension was paid till 1534, when it is supposed he received the promotion—a very unsafe

inference. The rectorship of Tyrie, which he held at his death, is, however, supposed to have been the promotion in question.

Boeckh, August, ow'goost bék, German classical scholar: b. Carlsruhe, 24 Nov. 1785; d. Berlin, 3 Aug. 1867. In 1803 he entered the University of Halle, where he was induced by the influence of Wolf to devote himself to the study of philology. After spending three years here, and more than a year in Berlin, he returned in 1807 to his native state, and in the same year became extraordinary, and two years later ordinary professor in the University of Halle. He had already acquired such renown as a scholar, that in 1810 he was offered the chair of rhetoric and ancient literature in the newly founded University of Berlin; and here he remained enjoying this and other important offices and dignities for the rest of his life. The works of Boeckh have made an epoch in the history of philology and archæology. In his studies of classical antiquities he set forth the principle that philology ought to be an historical method intended to reproduce the whole social and political life of any given people during a given period; and in accordance with this he divided the science into two parts: (1) Hermeneutics and Criticism; (2) the Practical and Theoretical Life of the Ancients. His views were vigorously attacked in various quarters, but the majority of German scholars gathered around him, and he himself carried his views into effect in a number of important works. The most remarkable of these are the following: an edition of Pindar; 'The Public Economy of the Athenians,' which has been translated into English; 'Metrological Investigations of the Weights, Coins, and Measures of Antiquity', and 'Documents Concerning the Maritime Affairs of Attica.' Besides these he was uninterruptedly engaged from 1815 to the end of his life in making a collection of Greek inscriptions, which he published with the title 'Corpus Inscriptionum Græcarum,' and the first four volumes of which appeared at Berlin between 1824 and 1862. The first three volumes of a collection of his minor works, edited by Ascherson, appeared during the lifetime of the author.

Boehler, bē-lēr, Peter, Moravian bishop: b. Frankfort-on-the-Main, 1712; d. London, 1775. He was educated at Jena, joined the Moravians and was ordained to the ministry. He was sent as a missionary to America, working among the negroes in Georgia, the Germans in North Carolina (who later settled Bethlehem, Pa.), and the Indians of Pennsylvania. He went to Europe and returned to Bethlehem with a large number of colonists. In 1742, he was made bishop of the Moravian churches in America, England, Ireland, and Wales.

Boehm, bēm, Henry, clergyman: b. Conestoga, Pa., 8 June 1775; d. near Richmond, Staten Island, 28 Dec. 1875. Under the influence of Bishop Asbury, Boehm, whose father was a Mennonite clergyman, became an itinerant minister of the Methodist Church. In this capacity he traveled over 100,000 miles on horseback between the years 1800 and 1842, when he was stationed at Staten Island

as a supernumerary. He served 74 years in the ministry, and at the time of his death was the oldest Methodist minister in America. A special service in honor of his 100th birthday was held 8 June 1875. He wrote 'Reminiscences, Historical and Biographical, of Sixty-four Years in the Ministry' (N. Y. 1865; new ed. 1875, ed. by J. B. Wakeley and others).

Boehm, Sir Joseph Edgar, Hungarian-English sculptor: b. Vienna, 1834; d. 12 Dec. 1890. He went to London in 1862, and lived there from that date, becoming a member of the Royal Academy in 1881. Among his important works are the great statue of Queen Victoria at Windsor; statues of Bunyan at Bedford; Wellington at Hyde Park Corner; Dean Stanley at Westminster Abbey; Drake at Plymouth; Carlyle on Thames Embankment, and busts of Ruskin, Gladstone, and Huxley. In 1889 he was knighted. He was the fashionable sculptor of his time, but much of his work fails to reach a high standard and his designs for the jubilee coinage of 1887 were very adversely criticised.

Boehme'ria, a large genus of plants of the natural order *Urticaceæ*, natives of tropical Asia, where various species furnish fibres used in rope- twine- thread- and cloth-making. *B. nivea* (China grass) is a nettle-like, but non-stinging perennial herb which is propagated by seeds or root division. When once established three crops are obtained annually and the fibre removed by hand stripping, machinery, or boiling in water or chemical solutions. None of these methods are wholly satisfactory; for which reason China and India, those lands of cheap hand labor, still supply the world. The fibre is used to make China-grass cloth. *B. tenacissima* (ramie) (q.v.) or rhea, is considered by some botanists as a variety of *B. nivea*. Attempts to establish the China-grass and ramie industries in the United States have not been very successful; not because the plants cannot be raised economically, but because of the high price of labor in manufacture, and the inefficiency of machines and degumming methods. Both species and several others of the genus are effective ornamental plants in borders and are hardy as far north as Washington, probably farther. Consult: Dodge, 'Descriptive Catalogue of Useful Fibre Plants of the World'; Royle, 'Fibrous Plants of India.'

Bœo'tia, bē-ō'shī-a, a country of ancient Greece, bounded north by Phocis and the country of the Opuntian Locrians; east by the Euripus, or Strait of Eubœa; south by Attica, Megaris, and the Alcyonian Gulf, and west by Phocis. Its surface is estimated at 1,110 square miles; but the boundaries were not always the same. In the north it is mountainous and cold, and the air is pure and healthy, but the soil is less fertile than that of the other portion, which, however, is said to suffer from malaria. The mountainous part in the north was called in earlier times Aonia. Among the mountains of Bœotia are several remarkable in history and mythology — Helicon (now Zagora), the mountain of the Sphinx, the Teumessus, Libethrium, and Petrachus. Hypatus (modern name Samata), bounded the Theban plain on the

east. A feature of the country was Lake Copais, the district around which is a valley completely surrounded by hills, and connected with the Eubœan Sea by subterranean passages. The lake was fed by the Cephissus, the largest river in the country, and the water was liable to accumulate more rapidly than the natural drainage of the country could carry it off. Hence the early inhabitants suffered much from inundations, and at a period previous to historical annals subterranean channels were built to carry off the water, which indicate a very early civilization, and recognized from the ruins which still remain as among the greatest works of antiquity. These works made Bœotia one of the most fertile districts of Greece. Recently the lake has been drained at great expense and a large tract of land reclaimed. The chief occupation of the inhabitants was agriculture and the raising of cattle. Bœotia was first occupied by the Pelasgian tribes. In the time of Bœotus (son of Itonus, and grandson of Amphictyon, from whom it is said to have derived its name) these were subject to the Hellenes. It was divided into small states, until Cadmus the Phœnician founded the government of Thebes. In later times all Greece worshipped the Hercules of Thebes. After the death of Xanthus, king of Thebes, most of the cities of Bœotia formed a kind of republic, of which Thebes was the chief city. Epaminondas and Pelopidas raised Thebes for a time to the highest rank among Grecian states. In Bœotia are several celebrated ancient battlefields, namely, Plataea (now the village Kokla), where Pausanias and Aristides established the liberty of Greece by their victory over the 300,000 Persians under Mardonius; Leuctra (now the village Parapogia), where Epaminondas checked the ambitious Spartans; Coronea, where the Spartan Agesilaus defeated the Thebans; and Chæronea (now Capranu), where Philip founded the Macedonian greatness on the ruins of Grecian liberty. Near Tanagra, the birthplace of Corinna, the best wine was produced; here, also, cocks were bred of remarkable size, beauty, and courage, with which the Grecian cities, passionately fond of cock-fighting were supplied. Refinement and cultivation of mind never made such progress in Bœotia as in Attica. The Bœotians were vigorous, but slow and heavy. Several Thebans, however, were worthy disciples of Socrates, and Epaminondas distinguished himself as much in philosophy as by his military talents. The people were particularly fond of music, and excelled in it. They had also some great poets and artists. Hesoid, Pindar, the poetess Corinna, and Plutarch, were Bœotians.

Boerhaave, Hermann, hër'man boor-hä've, Dutch physician; b. Woorhout, near Leyden, 13 Dec. 1668; d. 23 Sept. 1738. Boerhaave received from his father a liberal education. In 1682 he was sent to Leyden to study theology. Here he gave, at the age of 20, the first public proof of his learning and eloquence. In 1678 he received a gold medal from the city for an academic oration, in which he attacked the doctrines of Spinoza. In 1689 he received the degree of Doctor of Philosophy, and maintained an inaugural dissertation, 'De

Distinctione Mentis a Corpore,' in which he attacked Epicurus, Hobbes, and Spinoza. He now commenced, at the age of 22, the study of medicine. Drelincourt was his first and only teacher. From him he received little instruction; and by his own solitary study he learned a science on which he was afterward to exert so important an influence. His first study was anatomy, which he pursued from books, rather than from observation. He attended dissections, indeed, but his writings show a deficiency of practical knowledge. Still he exercised a salutary influence on the study of anatomy, as the use he made of mechanical illustrations induced anatomists to apply themselves to a more accurate study of the forms of the organs. After this preliminary study, Boerhaave read all the works, ancient and modern, on medicine, in the order of time, proceeding from his contemporaries to Hippocrates, with whose superior excellence and correct method he was forcibly struck. He also studied botany and chemistry, and although still preparing himself for the clerical profession, was made in 1693 Doctor of Medicine at Harderwyck. After his return to Leyden, some doubts being raised as to his orthodoxy, he finally determined to follow the profession of medicine. In 1701 the University of Leyden chose him, on the death of Drelincourt, to deliver lectures on the theory of medicine. Boerhaave now began to develop those great and peculiar excellences which make him a pattern to all who undertake the office of instruction. Pupils crowded from all quarters to hear him. His method was eclectic, combining the speculations of opposing schools, and led him to attach too much importance to mechanical and chemical theories of vital actions. In 1709 the University of Leyden appointed him successor to Hotton, in the chair of medicine and botany. The course of instruction to which Boerhaave was now devoted, induced him to publish two works, on which his fame still rests, namely, 'Institutiones Medicæ in Usus Annuæ Exercitationis Domesticæ,' and 'Aphorismi de Cognoscendis et Curandis Morbis in Usum Doctrinæ Medicinæ.' In the former, which is a model of comprehensive erudition and clear method, he unfolds his system in its fullest extent; in the latter he undertakes the classification of diseases, and discourses separately on their causes, nature, and treatment. The professorship of botany, which he also filled, contributed no less to his reputation. He rendered essential services to botany by his two catalogues of plants in the garden of Leyden, the number of which he had very much increased. We are indebted to him for the description and delineation of several new plants, and the introduction of some new species. In 1714 he was made rector of the university. At the end of this year he succeeded Bidloo in the chair of practical medicine, which he occupied for more than 10 years. In this office he had the merit of introducing clinical instruction, that is, of lecturing to his students at the bedside of patients in hospital, for the first time in Europe. Busily occupied as he already was, the university conferred on him, at the death of Lemort, the professorship of chemistry, which science he had

taught since 1703. 'His Elements of Chemistry' is one of his finest productions, and notwithstanding the entire revolution which has taken place in this branch of science, is still highly valuable. His experiments are remarkable for their accuracy. So extensive a sphere of action gained for Boerhaave a fame that few learned men have enjoyed. People came from all parts of Europe to ask his advice. His property amounted at his death to 2,000,000 florins. Peter the Great visited him on his travels, and a Chinese mandarin wrote to him with the address, "To Boerhaave, the celebrated physician in Europe." In 1722 illness obliged him to remit his active pursuits. In this he returned in some measure to the principles of Hippocrates, from which, indeed, he had never departed far in practice. Boerhaave was a man of piety as well as learning. He arose early and devoted an hour every morning to prayer and the study of Scripture. He used to say that the life of a patient, if trifled with or neglected, would one day be required at the hands of the physician.

Boers (Dutch *boer*, a peasant or husbandman), the name commonly applied to the South African colonists of Dutch descent. The Cape Colony was founded by the Dutch in 1650. The Dutch were at this period the leading maritime power of Europe, and their African colonies assumed great importance. When Holland was reduced to the last extremity by the invasion of Louis XIV., serious thoughts were entertained of making the Cape Colony the final refuge of Dutch independence, but this crisis passed away with the advancing power of William. The colony subsequently fell into comparative neglect, and the colonists, left to their own resources, began to develop a character of their own. The troubles in which the parent state was involved by European wars now began also to affect them. The colony was taken possession of by the English in 1795, restored at the peace of Amiens in 1802, taken again in 1806, and finally ceded to England in 1815. The last change was highly distasteful to the colonists. Naturally distrustful of a foreign government, they had formed from their experience of the country and its inhabitants a policy and habits of their own, into which the newcomers could not be expected at once to enter. The Boers, moreover, were strongly conservative, believing that they understood the situation better than anyone else, and they had acquired in their struggles with the natives a reckless daring, which, added to the coolness and caution of the Dutch character, was likely to make them formidable opponents to any government which provoked their hostility.

The policy of the British governors was not always adapted to the circumstances, and the attempts of the British missionaries, encouraged by the colonial government, to convert and civilize the natives, excited the jealousy of the Boers, who thought their own interests compromised by the encouragement given to the converts. The government on various occasions sided with the Kaffirs against the Boers, which, whatever the merits of the particular disputes, was not calculated

to conciliate the latter. The emancipation of their slaves in 1833, and the cession to the Kaffirs in 1835 of a frontier district of neutral territory in the east, filled up the measure of provocation, and the Boers resolved to place themselves by emigration beyond the British rule. A first band set out by land in 1835 for Port Natal, but being ignorant of the passes of the country, went out of their way. Part of them settled in the district near the Zoutpansberg or Salt-pan Mountain, part proceeded to Algoa Bay, but did not succeed in forming a perfect settlement. Another band also proceeding to Natal was attacked by the Matebele Kaffirs, and obliged to fall back on the Modder River. After receiving reinforcements they again advanced and settling in the Orange River district, formed a commonwealth under Peter Retief. This colony was in 1837 invited to join the British settlers who had in the meantime taken possession of Port Natal. Crossing the Quathlamba Mountains for this purpose, Retief and some of his principal followers were treacherously murdered in an interview with the chief of the Zulu Kaffirs. The remainder turned south, and formed the settlement of Pietermaritzburg. Under the leadership of Pretorius they defeated the Zulus, but the colonial government denied their right to form an independent community in this district.

In 1842, a British force was landed, and the Boers were compelled to retire from the coast and acknowledge the British sovereignty. Many of them recrossed the mountains, and settled in the Vaal district. Further disagreements with the colonial government, which had now possession of Natal, led to another emigration to the north of the Klipp River. Here they struggled successfully with the Kaffirs till 1845, when the colonial government proclaimed the Buffalo River the north boundary of Natal. The Boers openly resisted, but finding their strength unequal to the conflict, again emigrated to the Vaal country. In 1848 the colonial government likewise annexed by proclamation the Orange River settlement. The Boers, headed by Pretorius, took up arms, but being defeated retired beyond the Vaal, and with the previous settlers formed the Transvaal republic. Those who remained continued their resistance to the British authority until, in 1851, on the outbreak of the Kafir war, the British relinquished the Orange River territory, and recognized the independence of the Orange Free State. In 1877 the Transvaal was annexed by Britain, according to the wish of many of the people, but war broke out in 1880, British forces suffered more than one defeat, and in 1881 the country was accorded a modified independence. Henceforth it was a common feeling among the Boers that they and not the British must be predominant in South Africa, and in October 1899, after a defiant ultimatum, the united forces of the Transvaal and Orange Free State invaded Natal. After nearly three years of warfare the two republics were annexed by proclamation. See JAMESON; KRUGER; MAJUBA HILL; NATAL; ORANGE RIVER COLONY; SOUTH AFRICAN WAR; TRANSVAAL, etc.

Boëthus, Greek sculptor: b. Chalcedon in the 2d century B.C. He is celebrated for his statues of children. 'The Boy With the Swan' was his most famous work. A girl playing with dice and a boy extracting a thorn were subjects of other masterpieces by him.

Boethius, bō-ē'thī-ūs, **Anicius Manlius Severinus**, Roman statesman and philosopher: b. about 470 A.D., in Rome or Milan; d. 524 or 526. He was educated in Rome, in a manner well calculated to develop his extraordinary abilities. Theodoric, king of the Ostrogoths, then master of Italy, loaded him with marks of favor and esteem, and raised him to the first offices in the empire. He exerted the best influence on the administration of this monarch, so that the dominion of the Goths promoted the welfare and happiness of the people who were subject to them. He was long the oracle of his sovereign and the idol of the people. The highest honors were thought inadequate to reward his virtues and services. But Theodoric, as he grew old, became irritable, jealous, and distrustful of those about him. The Goths now indulged in all sorts of oppression and extortion, while Boethius exerted himself in vain to restrain them. He had already made many enemies by his strict integrity and vigilant justice. These at last succeeded in prejudicing the king against him, and rendering him suspicious of Boethius. His opposition to their unjust measures was construed into a rebellious temper, and he was accused of a treasonable correspondence with the court of Constantinople. He was arrested, imprisoned, and executed. He made many laborious translations of the Greek philosophers, particularly of Aristotle. These translations, and especially his commentaries on Aristotle, caused him to be regarded up till the 14th century as the highest authority in philosophy. His treatise, 'De Musica,' also supplied for many centuries the place of Greek originals. His fame now chiefly rests on his 'Consolations of Philosophy,' written in prison, a work of elevated thought and diction. It is written partly in prose and partly in verse. The oldest edition of this work was published at Nuremberg in 1473. It was translated by King Alfred and Chaucer, and was highly prized during the Middle Ages. Boethius also translated into Latin Euclid and other Greek mathematical works, and wrote short treatises on algebra and geometry, which were used as school text-books during the Middle Ages. The appearance in these works of characters similar to Hindu numerals has raised the question as to whether he was familiar with the works of the Hindu mathematicians.

Boëttcher, bé'tik-ër, **Jean Frederick** (his name is also spelled **Boettiger**), German alchemist: b. Schleiz, 1681; d. 1719. A man of dissolute manners and dishonorable conduct, he is celebrated for his extraordinary adventures, and his fortunate discovery of the famous Dresden porcelain. Apprenticed to an apothecary in Berlin, he spent his time in the pursuit of alchemy, and fraudulently pretended to have made gold. This discovery, as it was believed to be, exposed him to the danger of a prosecution for sorcery, to avoid

which he fled. Such was the credulity of the time, that the Prussian government was anxious for his return, and the Elector of Saxony, then king of Poland, supplied him with the means of prosecuting his inquiries, and was entertained by his promises for three years. By the advice of Count Tschirnhausen, the elector was induced to turn the real chemical knowledge and abilities of Boëttcher to account in developing the resources of the country. This sensible advice was rewarded with the discovery of a red clay at Meissen, from which a beautiful porcelain could be made. Boëttcher was intrusted with the direction of the manufacture, but was so little trustworthy that he had almost to be detained a prisoner to prevent his divulging the secrets of the process. He had actually entered into a negotiation with some Prussians to do so, and his death alone saved him from the punishment of his treachery.

Boeuf Bayou, béf bi'oo, a stream in Louisiana, formed in times of high water by overflow from the Mississippi, when it affords nearly 100 miles of steamboat navigation. It is an affluent of the Washita River.

Boffin's Bower, in Dickens' 'Our Mutual Friend,' home of the Boffins. The name was given by Mrs. Boffin, who did not approve of its former name, "Harmon's Jail."

Bog, an Irish word, literally meaning soft, applied in Great Britain to extensive districts of marshy land, such as we commonly call in this country swamps. They consist, in Europe, so universally of peat, that this substance is there generally regarded essential to a bog. As we use the word, it is in the sense of a quagmire; any soft and wet spot into which a man would sink in attempting to cross it, being called a bog. The true bog is most commonly found in northern latitudes, and in districts where great humidity prevails. Their situation is not necessarily low, nor their surface level. Some of the great Irish bogs present even a hilly appearance, which, perhaps, is the result of the spread of the mosses in their lateral growth from lower situations over intervening higher grounds. Bogs were formerly supposed to owe their origin to the destruction of forests, and in particular to the obstruction of drainage from fallen trees, causing lodgments of water, and favoring the growth of marsh plants. This theory can only be partially true. Fallen trees and also standing roots are frequently found in a state of great preservation in bogs, but the agency of felled trees in the production of bog has been completely disproved, six or seven feet of bog being found under the roots of remaining trees, showing the previous formation of the bog. The process of bog formation is thus described: When a shallow pool induces the formation of aquatic plants, they gradually creep in from the borders to the deeper centre. Mud accumulates round their roots and stalks, and a spongy semi-fluid mass is formed, well suited for the growth of moss, particularly Sphagnum, which now begins to luxuriate, continually absorbing water, and shooting out new plants above as the old decay beneath; these are consequently rotted, and compressed into a solid substance, grad-

BOG-BUMPER—BOG IRON ORE

ually replacing the water by a mass of vegetable matter. A layer of clay, frequently found over gravel, assists the formation of bog by its power of retaining moisture. When the subsoil is very retentive, and the quantity of water has become excessive, the superincumbent peat has sometimes burst forth and floated over adjacent lands. This happened near Killarney in 1896, and caused the loss of nine lives. Quagmires are caused by the decay of the roots of plants underneath. The plants thus detached from the bottom, rise to the surface, and are kept floating in moisture. Elastic under light pressure, they yield suddenly to the weight of heavy bodies, their only strength consisting in the interlacing of their decayed fibres.

Throughout the country, along the seaboard to the gulf of Mexico, bog-like swamps are of frequent occurrence. Their outer portions are sometimes wooded swamps, while within they present moss-covered heaths, stretching, like the western prairies, farther than the eye can see, and dotted occasionally with clumps or little islands of trees. In New England, the northwestern States, and Canada, the bogs furnish genuine peat, and some of those bordering on the Great Lakes are of great extent. On Long Island, near New York, the bogs present a marked feature along the sandy coast.

British bogs are generally divided into two classes—red bogs, or peat mosses, and black bogs, or mountain mosses. The former class are found in extensive plains frequently running through several counties. The Chatmooss in Lancashire, and the Allen in Ireland, are examples of this class. Their texture is light and full of filaments, and is formed by the decay of mosses and plants of different kinds. The color becomes darker, and the density increases with the depth of the bog. The lower parts, being more entirely decayed, approach nearer to the nature of humus than the upper portion. They are also more carbonaceous, and consequently more valuable for fuel. The depth of the red mosses varies from 12 to 42 feet. The chief reasons of the unproductiveness of this class of bogs are the acids in which the plants composing them abound, and which are noxious to the higher orders of vegetation, and the circumstance that the decomposition of the plants takes place under water, where they are excluded from the action of the oxygen and nitrogen of the air, and consequently deprived of the power of evolving carbon and ammonia. Black bog is formed by a more rapid decomposition of plants. It is heavier and more homogeneous in quality. It is common in Ireland and Scotland, but is usually found in limited and detached portions. In Ireland these frequently rest on calcareous subsoil, which is of great value for reclaiming them. The black bog is so frequently found at high elevations that its reclamation presents considerable difficulties, but when it is found in plains or gentle inclinations it may be reclaimed with comparative ease. The soil in mountainous districts, being shallow, is not suited for cereals, but if the mistake of sowing these is avoided, they may be made into good pasture land. The reclamation of the extensive red bogs found

in various parts of the country, especially in Ireland, which has more than 1,500,000 acres of them, has long occupied attention; but the progress of improvement has been hindered by questions of land tenure, disposal of capital, and other difficulties external to the practicability of the desired reformation. Many extensive experiments have, however, been made with encouraging success, and while it is perhaps doubtful how far reclamation will repay the immediate improver, it appears from a national point of view to offer undoubted advantages.

In the reclamation of bog land three things require to be accomplished. The land must be thoroughly drained, and a permanent system of drainage established. The loose and spongy soil must be mixed with a sufficient quantity of mineral matter to give the requisite firmness to its texture, and to fertilize its superabundant humus. Proper manures must be provided to facilitate the extraction of nutriment from the new soil, and a rotation of crops suitable for bringing it into permanent condition adopted. The difficulties of reclamation lie chiefly in the first and second of these requirements.

The materials best adapted for reclaiming peat are calcareous earths, limestone gravel, shell marl, and shell sand. Caustic lime, although it neutralizes the acids of the soil, causes too rapid a decomposition of the vegetable matter. These materials are frequently found in the subsoil or in the neighborhood, but the labor of raising them from the subsoil is often greater than that of bringing them from other, especially from adjacent quarters.

Paring and burning, or removing a portion of the peat for fuel, when the subsoil is good, are other modes of facilitating improvement. The limited demand for peat fuel prevents the latter system being carried on extensively. Thoroughly reclaimed bogs are not liable to revert to their former condition. For further particulars see CHATMOSS.

Bog-bumper, Bog-jumper, or Bog-pumper. See BITTERN.

Bog-butter, a fatty spermaceti-like substance found in masses in peat-bogs, composed of carbon, oxygen, and hydrogen, and for years supposed to have been formed by the decomposition of peat. In 1885 Macadam proved that it is of animal origin, being, in fact, a variety of adipocere, and is formed by the decomposition of animal substances, out of contact with the air.

Bog Iron Ore, a variety of limonite formed in bogs and swamps by the reducing action of decaying vegetable matter on soluble iron salts. It is generally loose textured, and brown or brownish yellow in color. The ore usually contains such a high percentage of impurities, especially sulphur and phosphorus, that it cannot be utilized for iron manufacture; it finds limited application, however, in the purification of illuminating gas. Deposits of bog iron ore are widespread. In the United States extensive beds occur along the Atlantic coast from New York southward, and the first blast furnaces erected in this country were supplied from them. Similar deposits occur in Great Britain and most of the countries of Europe.

Bog-moss. See SPHAGNUM.

Bog-oak, trunks and large branches of oak found imbedded in bogs and preserved by the antiseptic properties of peat, so that the grain of the wood is little affected by the many ages during which it has lain interred. It is of a shining black or ebony color, derived from its impregnation with iron, and is frequently converted into ornamental pieces of furniture and ornaments, as brooches, earrings, etc.

Bog-trotter, a name contemptuously applied to the Irish peasantry on account of their ability to make their way across the bogs where no one else can find footing, which frequently gives them a means of escape from officers of police, and other pursuers.

Bogaers, Adriaan, ä'dri-än bö'gärs, Dutch poet: b. The Hague, 1795; d. 1870. He holds an eminent place among the many disciples of Tollens, and surpasses his master in correctness of taste. He long withheld his compositions from publication, and not till 1832 did he become known to his countrymen; he then published his first lyric poem, 'Volharding,'—an appeal to his countrymen to stand fast in the struggle with Belgium,—together with other patriotic pieces. His first poem of any considerable compass, the epic 'Jochebed,' and his masterpiece, 'The Voyage of Heemskerk to Gibraltar,' were first formally published in 1860-1, though they had had for many years a private circulation among friends. He afterward published three volumes, 'Ballads and Romances,' 'Flowers of Poesy from Abroad,' and 'Poem.'

Bo'gan, or New Year River, a river of East Australia, rises in the Harvey range, flows northwest, and empties into the Darling River; length over 300 miles.

Bogar'dus Everardus, second pastor of the church in New Amsterdam (New York): d. 27 Dec. 1647. He is noted as the husband of Anneke Jans, whose ownership of 60 acres of land in the business portion of New York has given her descendants occasion for almost continuous law suits, during 200 years, to recover possession of the property which is held by the corporation of Trinity Church.

Bogardus, James, American inventor: b. Catskill, N. Y., 14 March 1800; d. 13 April 1874. He was apprenticed to a watchmaker, and early showed the bent of his mind for improvements in the construction of eight-day clocks, and by the invention of a delicate engraving machine. The dry gas meter is his invention, as is also the transfer machine to produce bank-note plates from separate dies; and in 1839 his plan for manufacturing postage stamps was accepted by the British government. Later he introduced improvements in the manufacture of india-rubber goods, tools, and machinery; and invented a pyrometer, a deep-sea sounding machine, and a dynamometer. In 1847 he built the first iron building ever erected in the city of New York.

Bogatzy, Karl Heinrich von, kärl hîn'-rîn fôn bö-gäts'ke, Protestant theological writer: b. Tankowa, Silesia, 1690; d. Halle, 1774. His principal works are: 'Täglicher Schatz-Kästlein der Kinder Gottes,' published in 1718; 'Geistliche Gedichte,' in 1749. The former has been translated into English under the title of Bogatzky's 'Golden Treasury.'

Bogdo-ola, bög-dō-oo'lā, or **Holy Mount,** a hill in Russia, in the government of Astrakhan, near the Aktuba, and 14 miles east of Tcher-noiarsk. It forms an isolated cone, nearly 500 feet high, in the middle of a vast steppe. It appears to rest on limestone, overlain by sandstone, which on the northeast side rises perpendicularly like a wall, and is cut into deep clefts, frequented by innumerable birds. The sandstone is succeeded by alternate red and white layers of clay and sand, which have a very singular appearance. The summit is chiefly composed of masses of rock-salt. At the foot of the hill there is a salt lake called Bogdoin Dabassu.

Bogdan, Negrul, governor of Moldavia, son of Stephen the Great, who, at his death in 1522, counseled his son to anticipate by voluntary submission to the Turks, an inevitable conquest. Bogdan did not at first follow this counsel; but having lost within a year the battle of Mohács, and Hungary having been invaded by a large Turkish force, he sent to Solymán offers of submission. He was received with favor by the Sultan, and in return for an annual tribute of 4,000 crowns of gold, beside numerous horses and falcons, Moldavia was allowed to preserve its own religion, an independent administration, and the right to choose its own princes. Bogdan did not long survive this treaty, and his successor refusing to pay the tribute, drew again the arms of the Turks upon the Moldavian principality.

Bogdanovich, Modést Ivanovich, mō-dāst ē-vān'ō-vich bög-dā-nō'vech, Russian military historian and commander: b. 1805; d. 6 Aug. 1882. He was a very able soldier, and even abler with the pen: his 'Bonaparte's Campaign in Italy, 1796,' and 'History of the Art of War,' and particularly his 'History of the Campaign of 1812,' having attracted wide notice.

Bogdanowitch, Hippolyt Federowitch, hîp'-pō-lît fêd-ēr-ō'vech bög-dā-nō'vech, Russian Anacreon: b. Perewolotschna, in White Russia, 1743; d. 1803. His father was a physician. He was designed for an engineer, but the sight of a splendid play, and the reading of Lomonosow's poems, turned his inclination to poetry. He wished to become an actor, but the manager of the theatre, Cheraskow, dissuaded him from his purpose. By his advice he applied himself to the study of the fine arts, and to learning foreign languages. He gained patrons and friends, and in 1761 was made inspector in the University of Moscow, and afterward translator in the department of foreign affairs. In 1762 he traveled with Count Beloselsky as secretary of legation to Dresden, where he devoted his whole attention to the study of the fine arts and of poetry till 1768. The beautiful pictures in the gallery of that place inspired him to write his 'Psyche,' which appeared in 1775, and fixed his fame on a lasting foundation. After this he devoted himself to music and poetry, in solitary study at St. Petersburg, till Catharine called him from his retirement. He then wrote on different occasions several dramatic and historical pieces. In 1788 he was made president of the imperial archives. In 1795 he took leave of the court, and lived as a private man in Little Russia. Alexander recalled him to St. Petersburg, where he lived till his death. He was as

remarkable for modesty as for genius, and a man of childlike goodness and vivacity.

Bogerman, Jan, yän bö'gér-män, Dutch theologian: b. Oplewert, 1576; d. 1637. He was professor of divinity at the University of Franeker; participated in the Armenian controversy, and was president of the Synod of Dort, 1618. With four others he translated the Bible into Dutch; this translation is at present the common Dutch version. He also wrote 'Annotationes contra H. Grotium,' and translated Beza's 'De la punition des hérétiques.'

Bogert, George H., artist: b. New York, 1864. His first studies were made under Thomas Eakins; later he studied in Paris under Raphael Collins, Aimé Morot, and Puvis de Chavannes. He won the Webb prize, 1898; the first Hallgarten prize of the National Academy of Design, 1899; and was awarded a bronze medal at the Paris Exposition, 1900. His studio is in New York.

Boggs, Charles Stuart, American naval officer: b. New Brunswick, N. J., 28 Jan. 1811; d. 22 April 1888. He entered the navy in 1826; served on the Princeton in the Mexican war; was assigned to the gunboat Varuna in Farragut's Gulf squadron in 1861. In the attack on forts St. Philip and Jackson, in April 1862, he destroyed six Confederate gunboats and two rams, and in the last moments of the fight his own vessel was sunk. In 1860-70 he served with the European squadron; in the latter year was promoted to rear-admiral; and in 1873 was retired.

Boggs, Frank M., artist: b. Springfield, Ohio, 6 Dec. 1855. He received his art education at the École des Beaux Arts and under Gérôme in Paris. In 1882 the French government bought his picture, 'Place de la Bastille,' for the Luxembourg Museum, and in 1883 his 'Isigny' for the Niort Museum. His pictures are to be found in many of the best French private collections, and in the museums at Havre, Nantes, and Dieppe. In the first prize fund exposition of the American Art Gallery (N. Y.), he received a prize of \$2,500 for his picture 'A Rough Day, Honfleur,' now in the Boston Museum.

Bøgh, Erik, ē'rik bèg, Danish poet and dramatist: b. Copenhagen, 17 Jan. 1822. He is best known for his witty stanzas and epigrams in periodicals, for 'This and That,' a collection of humorous essays, and for a hundred or so of plays and farces. A novel, 'Jonas Tværmose's Vexations,' has merit.

Boghaz-Keui, bö'gäz-kyé'e, Asia Minor, a village in the vilayet of Angora, commonly identified with the ancient Pterium, though this is now doubtful. The village is insignificant, but important Hittite ruins, including a palace and a number of unusual sculptures, have been discovered near by.

Boghead Coal, a brown cannel-coal, found at Boghead, near Bathgate, Scotland, and very valuable for gas and oil making.

Bognor, bög'nér, an English watering-place on the coast of Sussex, nine and a half miles southeast of Chichester by railway. There is a pier 1,000 feet long, constructed chiefly of iron, and also an esplanade. The

place was brought into vogue toward the end of last century by Sir R. Hotham, who spent \$300,000 on it. Pop. (1901) 6,180.

Bo'go, Philippines, a town with about 17,000 population, situated on the east coast near the northern end of the island of Cebu. It has a good harbor.

Bog'omiles, a religious sect, said to have been pretty widely spread in Thrace and Bulgaria as early as the 10th century. They were persecuted by the Byzantine emperor, Alexander Comnenos, and their leader, named Basil, was burned alive at Constantinople in 1118. The name of the sect is said to be composed of two Slavonic words, meaning friends of God. The Bogomiles believed that God had two sons, Satanael and Jesus, or Logos. The former rebelled, and created the material world, and also man. God gave a soul to man, but he was left under the control of Satanael until the coming of the Logos. The law was given to Moses by Satanael, and is not recognized by the Bogomiles, who accept of the Old Testament only the Psalms and the Prophets. The Logos, or Christ, came down from heaven to deliver man from the power of Satanael. This sect, which held many extravagancies of doctrine, continued to exist for several centuries. They practised severe asceticism, rejected the sacraments, or put new interpretations on them, and made frequent prayers both by day and night.

Bogos, bö'göz, a people of Abyssinia, occupying a district to the south of the Anseba, to the east of Habab and Mensa, and to the north and west of Barca. The land is intersected by the broad and beautiful valley of the Anseba, and comprises on the west the elevated and hilly region as far as the sources of the Barca, and on the east the slopes of the plateau of Mensa. The climate and vegetation are similar to those of Abyssinia. The rainy season lasts from March to September, when the Anseba overflows its banks and fertilizes the valley through which it flows. There is a great variety both in the flora and the fauna of the country. Large baobab trees, sycamores, and tamarinds overshadow the banks of the Anseba, which are rendered almost impassable by the number of Euphorbia and creeping plants. At the same time there are to be found rhinoceroses, elephants, wild boars, buffalos, antelopes, lions, leopards, wildcats, jackals, wolves, etc., in great numbers. The population is only about 10,000, which is engaged in agriculture and the raising of cattle, and carry on a trade with the neighboring places in corn, butter, ivory, skins, buffalo-horns, and ostrich-feathers. Their language, which is akin to the Agow, is called by themselves Bilin. Their countenance is Greek in its contour, their body light, powerful, and well formed; the color of their skin dark olive-brown; their lips are thin, the cheekbones not prominent, and they have generally bushy whiskers. The patriarchal institutions of the Bogos are peculiar. The members of each union of families are pledged to apprehend any one of their number who is charged with the commission of a crime. The laws relating to dowries, inheritance, and murder are regularly codified. The religion is the Christian, but Mohammedanism, which is increasing, has a considerable number of adherents.

Bogoslov, bō-gō-slōf', a small volcanic island of the Aleutian archipelago, lying northwest of Unalaska. It was formed in 1795-6 by a series of volcanic upheavals; on the site previously there had been low rocks and reefs.

Bogotá, bō-gō-tā', or **Santa Fé de Bogotá**', the capital of the Republic of Colombia, has a population of about 120,000; and despite the fact that it is but 4° 41' north of the equator, the elevation of the plateau on which it stands is so great that the breeze is cool and invigorating. A fertile plain or table-land of exquisite beauty extends for a distance of about 30 miles on three sides, while directly above rise two mountains of moderate height, and surrounding the whole scene are snow-capped peaks of the Andes—among them the extinct volcano of Tolima. Water is supplied by two mountain streams flowing through the town itself. Unfortunately the overcrowding of buildings occupied by the poorer classes, and the absence of a good system of drainage, offset the conditions otherwise favorable to health. Bogotá is lighted by gas and electricity; its streets are well laid out; and the houses, though low, are substantially built. There is a valuable library of over 50,000 volumes; and the university, founded in 1867, is considered the best in the Andean region north of Peru. On 12 Sept. 1902, the government decreed the establishment of a museum and academy, to increase the popularity and efficiency of the National School of the Fine Arts. Founded in 1538 by Gonzalo Ximénes de Quesada, a native of Santa Fé, a small town near the city of Granada, and in the Spanish province of that name, Bogotá became the capital of New Granada, as the country was first called by the Spaniards. For history, industries, etc., see **COLOMBIA**.

MARRION WILCOX.

Bogue, David, the originator of the London Missionary Society: b. Hallydown, Berwickshire, 18 Feb. 1750; d. Brighton, 25 Oct. 1825. In 1771 he removed to London, and became minister of an Independent chapel at Gosport. In 1780 he became tutor to an establishment for directing the studies of young men destined for the ministry in the Independent communion. He now began the formation of a missionary scheme, which afterward resulted in the London Missionary Society. The influence which the establishment of this institution had on the public mind was great, and the springing up of the British and Foreign Bible Society and the Religious Tract Society, at short intervals, proves how much good was effected by the impetus it imparted. In the establishment of both of these he took an active part, contributing to the latter body the first of a series of publications which have been of great use. In 1815 Mr. Bogue received the degree of Doctor of Divinity from Yale College. The only works of any extent for which we are indebted to the pen of Dr. Bogue are: 'An Essay on the Divine Authority of the New Testament,' 'Discourses on the Millennium,' and a 'History of Dissenters,' which he undertook in conjunction with his pupil and friend, Dr. Bennet. The first of these has been translated into the French, Italian, German, and Spanish languages, and has been widely circulated on the continent of Europe.

Boguslawski, bō-goo-slāv'ske, **Palm Henry Louis von**, astronomer: b. Magdeburg, 1789;

d. Breslau, 1851. He was educated in the Cathedral School of Magdeburg, and early displayed a particular turn for astronomical pursuits. The comet of 1807 gave him the first opportunity of making special observations. In 1809, having been appointed bombardier in the Silesian Artillery Brigade, he passed his examination in Berlin with so much distinction that he was named lieutenant, and remained in attendance on the general military school in Berlin, where he took part in Bode's observations on the great comet. The campaigns of the war of independence procured him, through his connection with Bode, access to the best observatories and the acquaintance of the most distinguished astronomers. His military career terminated at the battle of Waterloo, after which, in consequence of a supervening weakness in his eyesight, he became unfit for further active service. He afterward turned his attention to agriculture, and in course of time his eyesight was completely restored. His love for astronomy had always remained, though he had wanted proper opportunity for cultivating it; but in 1829, on resuming his residence in Breslau, his studies again took that direction, and he became first conservator and then director of the observatory. By his discovery, in 1834, of the comet named after him, and his observations on Saturn's rings, and the comets of Biela, Encke, Halley, etc., he rendered important services. As no chair was connected with his position at the observatory, he at first merely delivered popular lectures. A regular professorship, however, was given him in 1836. As a writer he made himself known by the publication of the 'Uranus.'

Boha-eddin, bō-hā-ēd'din, or **Bohaddin**, Arabian scholar and historian: b. Mosul, 1145; d. 1235. Having attained proficiency in Moslem law, he became, at the age of 27, a lecturer at Bagdad. In 1186 he made the pilgrimage to Mecca, and returned through the holy land, visiting Jerusalem, Hebron, and other sacred cities. While in Damascus, he was summoned to the Moslem camp by Saladin, who was desirous of availing himself of the services and influence of so able a scholar, and a man of such reputed Moslem piety and zeal. He accordingly brought his learning and talent to the work of glorifying the wars of that ambitious monarch, in a treatise on the 'Laws and Discipline of Sacred War.' Saladin appointed him *cadi* of Jerusalem and of the army, and a strong attachment from the commencement existed between them, which the scholar knew well how to turn to good account. On the death of Saladin he transferred his attachment to the son, Malek-al-Dhaher, whom he was instrumental in establishing in the succession of the throne. In return, the new prince of Aleppo appointed Boha-eddin to the office of *cadi* of the city, which brought him constantly to reside in the royal court. Aleppo now became the resort for men of science and learning. At this period of his life Boha-eddin founded a college, and he continued to give lectures until he was 90 years old. His great work was, however, the 'Life of Saladin.' It is a work pronounced, on the whole, free from the extravagance which so generally renders Oriental productions distasteful to the more practical scholars of the West. It is written from the standpoint of a zealous Moslem, rather than from that of the practised soldier or the politic statesman.

Bohea, an inferior kind of black tea. The name is sometimes applied to black teas in general, comprehending Souchong, Pekoe, Congou, and common Bohea.

Bohemia, Böhmen (anciently BOHEIM), a province with the title of kingdom in the Austro-Hungarian monarchy, bounded on the southwest by Bavaria, on the northwest by the kingdom of Saxony, on the northeast by the Prussian province of Silesia, and on the southeast by Moravia and the archduchy of Austria. It contains 20,051 square miles, and has (1900) 6,318,697 inhabitants, of whom above three fifths are Czechs, nearly 90,000 Jews, and more than 2,000,000 are Germans. Bohemia is surrounded on all sides by mountains, possesses large forests and many small lakes or ponds. Its plains are remarkably fertile. The largest rivers are the Elbe and the Moldau. All sorts of grain, flax, hops (the best in Europe), and fruits are exported. Wine is not abundant, but in the neighborhood of Melnik is of pretty good quality. The raising of sheep, horses, swine, and poultry is carried on to a considerable extent. The mines yield silver, copper, lead, tin, garnets, and other precious stones, iron, cobalt, arsenic, uranium, and tungsten, antimony, vitriol, alum, calamine, sulphur, plumbago, and coal in abundance. There are also numerous mineral springs, but little salt.

The industry of Bohemia, favored by its central situation, has long rendered it one of the most important governments of the Austrian empire. Spinning and weaving are extensively carried on in the northern and southeastern districts; manufactures of lace, ribbons, metal, and wood work, chemical products, and other branches of skilled industry are also largely developed. Pottery, porcelain, glassware, cutting of precious stones, give employment to many hands. The glassware of Bohemia alone, which is known all over Europe, employs 50,000 workers. Large quantities of beer (Pilsener) of the kind known as lager are exported. Prague, the capital, is the centre of the manufactures and of the commerce of the country. The largest towns are Prague, Pilsen, Reichenberg, Budweis, Teplitz, Aussig, and Eger. For internal intercourse there are excellent highways, extending to 10,000 miles, and several important lines of railway leading both southeast to Vienna and northwest toward Dresden. The Bohemians of all ranks are distinguished for public spirit. Among the public establishments for education are a German and a Czech university at Prague, two technical high schools, four theological academies, many gymnasiums, and over 5,000 schools. The prevailing religion is the Roman Catholic; other sects, however, are tolerated. The language of the country is Bohemian, a dialect of the Slavonic; in some districts, and in most of the cities, German is spoken. See BOHEMIAN LANGUAGE AND LITERATURE.

History.—Bohemia received its name from a tribe of Gallic origin, the Boii, who were expelled by the Marcomans at the commencement of the Christian era; the latter were in turn obliged to give place to the Germans, and these to the Czechs, a Slavonic people who had established themselves in Bohemia by the middle of the 5th century. The country was at first divided into numerous principalities, which were

temporarily united into a monarchy in 627 under Samo, but the work of this prince did not survive himself. Charlemagne attempted the conquest of Bohemia without permanent result, although he succeeded in rendering it tributary; and the Emperor Louis had his army nearly destroyed by the Bohemians in 849. Christianity was introduced into Bohemia in the reign of Borzwoj I. (894-902), a descendant of Přemysl, whose family held sway in Bohemia for about six centuries (722-1306). In 1092 Bohemia was finally recognized as a kingdom under Wratisslas II. Up to 1230 the monarchy was elective and then became hereditary; the right of election, however, was suspended, not abrogated. The monarchs received investiture from the German emperor, held one of the great offices in the imperial court, and were recognized as among the seven electors of the empire. Separated from Germany, however, by a rampart of mountains, by origin, language, and national customs, the Bohemians kept aloof from the general politics of the empire, and their kings frequently received dispensations from attending the diet. The peasantry were in a state of villenage, but there was a numerous and powerful nobility, the diet assembled frequently, and the nobles came armed to defend their rights. The royal authority was limited by the coronation oath. Bohemia was frequently at war with Poland, the emperor, or some of the surrounding states; it was successively united and disunited with Hungary, Silesia, Moravia, etc., according to the course of wars and alliances. Ottokar II. (1253-78) had extended his conquests almost from the Adriatic to the Baltic, when he lost them and his life in contest with Rudolph, the founder of the too successful house of Hapsburg. His grandson Wenceslas III. was assassinated at Olmütz, and with him closed the dynasty of Přemysl. The house of Luxemburg succeeded in 1310, and governed Bohemia till 1437. Under Charles IV. (1346-78), who also held the sceptre of the German empire, Bohemia prospered, and advanced in civilization and science. Toward the close of this second dynasty civil wars were excited by the promulgation of the doctrines of Huss and the persecution of his followers. These wars were protracted by the genius of John Ziska, the leader of the Hussites, a man who, although latterly quite blind, has for military genius been compared to Hannibal. Ziska was rarely defeated, and his success inspired the utmost enthusiasm in his followers. He has been called the inventor of the modern art of fortification, and by his skill in this art he made Mount Tabor an impregnable fortress. After the death of Ziska the moderate party of the Hussites, who were called Calixtines, from their insisting on the retention of the sacramental cup for the laity, united with the Roman Catholics, and Sigismund was acknowledged king in 1433. The conditions of this compact being ill observed, George Podiebrad, a nobleman of the reformed party, was by them elected king in 1458. On his death in 1471 they chose Wladislas, son of Cassimir, king of Poland, who also obtained the crown of Hungary. His son Louis lost both crowns with his life in the battle of Mohács against the Turks, and Ferdinand of Austria became, in 1527, sovereign of both kingdoms. Bohemia then lost its separate existence, being declared hereditary in the house of Austria. Its subse-

quent history pertains to that of the Austrian empire. It was desolated by the Thirty Years' war, and it suffered severely from religious persecutions, by which, indeed, the reformed faith was almost entirely suppressed in it. The Emperor Joseph II. gave some protection to the Protestants. In 1848, when Europe was convulsed with revolutionary movements, a momentary attempt was made to assert the ancient independence of Bohemia against the Austrian dominion; a conflict took place between the army and the people, Prague was bombarded, and the insurrection suppressed. Since then the most prominent feature in the history of Bohemia has been a constant struggle for ascendancy between the Slavonic Czechs and the Germans. See AUSTRIA.

Bohemia Manor, the name given to a tract of some 5,000 acres bordering on the Elk River, Maryland, granted by Lord Baltimore in 1666 to Augustine Herman. The latter was a Bohemian surveyor who pledged himself to make a map of Maryland in return for the land. Obtaining denization papers, he and his family were naturalized under the first legislative act of that kind in the province.

Bohemian Brethren, a Christian sect which arose in Bohemia about the middle of the 15th century from the remains of the Hussites. Dissatisfied with the advances toward the Catholic Church by which the Calixtines had made themselves the ruling party in Bohemia, they refused to receive the compacts, as they were called, that is, the articles of agreement between that party and the council at Basel (30 Nov. 1433), and began about 1457, under the direction of a clergyman, Michael Bradatz, to form themselves into separate parishes, to hold meetings of their own, and to distinguish themselves from the rest of the Hussites by the name of Brothers, or Brothers' Union. Amidst the hardships and oppressions which they suffered from the Calixtines and the Roman Catholics without making any resistance, their numbers increased so much, through their constancy in their belief and the purity of their morals, that in 1500 their parishes amounted to 200, most of which had chapels belonging to them. The peculiarities of their religious belief are seen in their confessions of faith, especially their opinions with regard to the Lord's Supper. They rejected the idea of transubstantiation, and admitted only a mystical spiritual presence of Christ in the eucharist. In other points they took the Scriptures as the ground of their doctrines throughout, and for this, but more especially for the constitution and discipline of their churches, received the approbation of the reformers of the 16th century. This constitution of theirs was framed according to what they believed to have been that of the oldest apostolic churches. They aimed at restoring the primitive purity of Christianity by the exclusion of the vicious from their communion, and by making three degrees of excommunication, as well as by the careful separation of the sexes, and the distribution of the members of their society into three classes—the beginners, the proficient, and the perfect. Their strict system of superintendence, extending even to the minute details of domestic life, did much toward promoting this object. To carry on their system they had a multitude of officers of different degrees; or-

daining bishops, seniors, and conseniors, presbyters or preachers, deacons, ædiles, and acolytes, among whom the management of the ecclesiastical, moral, and civil affairs of the community was distributed. Their first bishop received his ordination from a Waldensian bishop, though their churches held no communion with the Waldenses in Bohemia. They were destined, however, to experience a like fate with that oppressed sect. When, in conformity with their principle of not performing military service, they refused to take up arms in the Smalkaldic war, Ferdinand took their churches from them, and in 1548, 1,000 of their society retired into Poland and Prussia, where they first settled in Marienwerder. The agreement which they concluded at Sendomir (14 April 1570) with the Polish Lutherans and Calvinistic churches, and still more the Dissenters' Peace Act of the Polish Convention (1572), obtained toleration for them in Poland, where they united more closely with the Calvinists under the persecutions of the Swedish Sigismund, and have continued in this connection to the present day.

Their brethren who remained in Moravia and Bohemia recovered a certain degree of liberty under Maximilian II., and had their chief residence at Fulneck in Moravia, whence they have been known as the Moravian Brethren. The issue of the Thirty Years' war, which terminated so unfortunately for the Protestants, occasioned the entire destruction of their churches, and their last bishop, Comenius, who had rendered important services in the education of youth, was compelled to flee. From this time they made frequent migrations, the most important of which took place in 1722, and occasioned the establishment of the new churches of the Brethren by Count Zinzendorf (q.v.). Although the old Bohemian Brethren must be regarded as now extinct, this society will ever deserve remembrance, as a quiet guardian of Christian truth and piety, in times just emerging from the barbarity of the Middle Ages; as a promoter of pure morals, such as the reformers of the 16th century were unable to establish in their churches; and as the parent of the esteemed and widely extended association of the United Brethren, whose constitution has been modeled after theirs. See UNITED BRETHREN.

Bohemian Forest (BÖHMERWALD), a mountain range or ridge of central Europe, extending from the Fichtelgebirge southward toward the confluence of the Elz and the Danube, and separating Bavaria from Bohemia. The Bohemian forest in ancient times formed a part of the Silva Hercynia, the highest peaks being the Arber (4,840 feet high) and Rachel. The great abundance of wood has occasioned the establishment of many glass houses, forges, etc., in this region. The inhabitants have acquired in their seclusion from the world, many characteristic virtues and vices.

Bohemian Language and Literature. The language of Bohemia, otherwise called Czech, is one of the Slavonic group of the Aryan or Indo-European family of tongues, and accordingly allied to Polish, Russian, Servian, Bulgarian, etc. (See SLAVS or SLAVONIANS.) The Czech (Bohemian) language or dialect was the first of the Slavonic idioms which was cultivated scientifically. It is spoken in Bohemia, Moravia, with slight variations in Austrian Silesia, in Hun-

gary, and in Slavonia. Three chief dialects of this language are recognized, namely the Bohemian or Czech proper, the Moravian of Moravia and Silesia, and the Slovak of Hungary. The Bohemian alphabet consists of 42 letters, expressing a great variety of sounds. The English sound of *ts* the Bohemian expresses with *c*, the English *y* with *g*, the *sh* with *ss* or *s*, the Italian *ce* or *ci* with *c* modified, the French *ge* and *gi* with *z*, the Italian *u* with *y*, the *gn* with *n*, the English *w* with *w*, particularly at the end of words. The sound of entire words, not that of the single letters which compose them, determines the roughness or smoothness of their pronunciation. The terminations of the various declensions and conjugations are mostly vowels, or the smoother consonants. In general, the Bohemian has a natural melody like that of the Greek.

The Bohemian language, moreover, has much expressiveness and energy, as it is not weakened by a number of articles, auxiliary words, conjunctions, and words of transition, but is able to represent the objects of imagination, of passion, and all the higher emotions of the poet and orator, in a lively manner; by its brevity, heaping together the most significant words, and arranging the connection of the parts of speech according to the degree of feeling to be expressed, so as to give the style, spirit, and energy, or gentleness and equability. Like various other tongues, it designates many objects by imitation of natural sounds. Thus the names of many animals are taken from their voices, as *kruta*, the turkey; *kachna*, the duck. Many plants are named from their effects, as *bolehlav*, hemlock (from headache). The conciseness of the language is increased by the absence of auxiliaries in the greater part of the verbs. The preterites, in the third person singular and plural, express a meaning still further condensed, as the variation in the last syllable is made to designate the sex; for example, *psal*, *psala*, *psalo*, he, she, it, has written; *psali*, *psaly*, *psala*, they have written. In like manner the Bohemian saves many prepositions and much circumlocution of other kinds, by the use of the *instrumental*, agreeing with the Latin ablative; for instance, *sečenjm mece hlavu mu st' al* (I read like *te*), "with a blow of the sword he has cut off his head." This language is, therefore, very well fitted for the translation of the Latin classics. By the use of the past participle active the Bohemian can designate, as well as the Greek, who has really performed the action contained in the predicate of the accessory clause, which the Latin, with its ablative absolute or participle passive, must leave always undefined and dubious. The same kinds of actions performed with different implements are often expressed by peculiar words; for example, the verbs *zřti*, *strjhati*, *krágeti*, *rezati*, denote to cut with the scissors, with the sickle, with the knife, and with the scythe. In the subtlety of grammatical structure the Bohemian is like the Greek, and has the advantage over the Latin and other languages. In speaking of two hands, two eyes, etc., the dual number is used; for example, *ruce*, *oci*, etc. The language is also capable of expressing the idea of duration, referring to an indefinite past time, like the Greek aorist; for instance, *kupowal dum*, *ale nekaupil ho*, he was engaged in buying the house, and did not buy it. The language affords several preterite tenses,

distinguished with great subtlety, as *kaupil*, he has bought once; *kupowal*, he had purchased for a long time; *kupowáwal*, he had purchased formerly several times; *kupowáwáwal*, he seldom had purchased in former times; moreover, by adding the auxiliary verb *byl*, a time still longer passed may be expressed, though this is very seldom used; for instance, *byl kupowáwal*, he had purchased in times long past. Another advantage of the language consists in the various future tenses by which the Bohemian denotes not only the time but also the duration, and the more or less frequent repetition of the action; for instance, *kaupjm*, I shall purchase once; *budu kupowati*, I shall be purchasing for a long time; *budu kupowáwati*, I shall purchase several times; and *budu kupowáwáwati*, I shall be purchasing very often. Not less manifold in signification, and equally subtle in the determination of time, are the participles and the participial constructions. The determination of sex and number by the final syllable of the participle gives the Czech language no small advantage over others. Small connective particles of speech the Bohemian has in common with the Greek. The Greek *alla*, *men*, *gar*, *de*, *te*, etc., agree with the Bohemian *ele*, *pak*, *wsak*, *li*, *z*, *t'*; only the three latter are always affixed to a word. Finally, the free, unrestrained arrangement of the words contributes much to perspicuity, as the Bohemian is less fettered than almost any other modern language to a particular order.

Bohemian Literature has been divided historically into five periods. The first extends from mythological times to 1409. It affords no written documents of remote antiquity. We know, however, that the language at an early period was similar to the present from the names of the gods, dukes, rivers, cities, and mountains which have been preserved, such as Perun, Przemysl, Borzwog, Wltawa, Bila, Praha, Tetin. The Slavonian apostle Method, and the philosopher Constantine, called *Cyryl*, made the Slavonians in Moravia acquainted with Christianity. Thence it penetrated to Bohemia, and thus the people of this country received the Græco-Slavonic ritual in the year 845. The same Constantine invented for the sounds of the Slavonic language the Cyrillo-Slavonic alphabet, borrowed mostly from the Greek. In later times the Glagolitic alphabet sprang up, of which, however, less use was made. When the Latin Church supplanted the Greek in Moravia and Bohemia, the Latin alphabet came also into use instead of the Cyrillic. In Bohemia the Cyrillic character remained in use only with the monks of Sazawa, who observed the Slavonic ritual. As the Latins endeavored to annihilate all the writings of the old ritual, and the Slavonic language was, in many cases, obliged to give way to the Latin, Bohemian literature suffered incalculable injury; hence we possess from the earlier centuries but a few insignificant remains in the characters above-mentioned. In the 10th century the Bohemians had a school at Kudet, in which they learned Latin. Their most ancient relic is the hymn (*Hospodine Pomiluyny*) of Bishop Adalbert (*Wegteck*), a native Bohemian, sung to the present day even by the Russians and Poles. The Bohemians possess some remains of a collection of lyrico-epic national songs, without rhyme, which seem to have been of great merit. The manuscript appears to have been written in 1290 and 1310. Goethe

found these national songs worthy of particular attention. Under the Emperor Charles IV., who promoted the cultivation of the Bohemian language, the University of Prague was founded in 1348. In the Golden Bull he commanded the sons of the German electors to learn the Bohemian language. Under his son, the Emperor Wenceslas, all decrees were written in Bohemian, which formerly were in Latin. Prague was then not only the most populous city in this part of Europe, but also, on account of its splendid court and the wealth of its citizens, the centre of the arts and sciences. Almost all the intellectual currents of the West found entrance into Bohemia, and German literature in particular had a powerful influence. The heroes of the Alexandrian and Arthurian cycles of romance became familiar to the Czechs in their own language. Dalimil Mezericky wrote a history of Bohemia in verse; Ondreg Z. Dube, a collection of Bohemian laws, in three volumes; Warinec Z. Brezowa, a history of the Roman emperors, and translated Mandeville's 'Travels'; and Pribik Pulkawa, a Bohemian history. This period affords also many vocabularies, poems, songs, and translations.

With Huss began the second period, from 1409 to 1500. The prevalence of religious disputes caused the Bible to be generally read and understood. Huss of Hussinetz translated Wicliffe's book, 'Trialogus,' into the Bohemian tongue, and sent it to the laymen as presents. The 'Treatise of the Six Errors' he caused to be inscribed in Bohemian on the walls of the chapel of Bethlehem. He wrote his first collection of sermons when at the castle of Kozy (1413), besides an 'Appeal to the Pope,' 'Commentary on the Ten Commandments,' an 'Explanation of the Twelve Articles,' two sermons on the Antichrist; the 'Triple Cord,' and several excellent hymns. His letters from the dungeon in Constance to the Bohemians were translated by Luther into Latin, accompanied with a preface, and printed at Wittenberg in 1536. He and Jakobellus and Jerome improved and distributed the Bohemian Bible, of which several copies have been preserved to our times. Of Ziska of Trocnow, one of the greatest generals in history, several letters and his rules of war have been preserved. From this period have come down to us, several war songs of the Taborites, also some songs of Prague. Martin Lupac undertook, with the assistance of some learned men, the labor of retranslating the whole New Testament. The church service was now performed entirely in the Bohemian language. Mladienowic, an eye-witness of the execution of Huss, wrote an account of his life. This used to be read in the Bohemian churches. Procopius continued the rhyming chronicles of Dalimil. Lodkowic related his 'Journey to the Holy Sepulchre,' Sasek of Mezyhor wrote 'Notes and Travels Through Germany, England, France, Spain, Portugal, and Italy of the Bohemian Baron Loew of Rozmital and Vlatna' (whom he accompanied), a contribution to our knowledge of the manners of the 15th century, published in a German translation at Brunn (1824). M. Gallus, Albik, Chrislan, Zidek, J. Cerny, J. Blowic, and Sindel, wrote on medicine, astrology, and agriculture. As early as 1447 we have an anonymous work on the grafting of trees. We have also the rhyming legend of the 10,000 knights, a translation of the fables of Æsop, the

council of the beasts and birds, in prose and verse, in three volumes (Placj Rada). Each lesson, which flows in rhyme from the mouths of the animals, is preceded by the natural history of the animals and the moral. It was printed three times in the Bohemian language, and published at Cracow in Latin verse (1521, 4to). Of the Bible 14 translations have come down to us, besides 10 of the New Testament. The oldest, of the year 1400, is in Dresden. The typographic art made a rapid progress in Bohemia. The first printed work was the Epistle of Huss from Constance, in 1459; the second, 'The Trojan War,' in 1468; the third, a 'New Testament,' in 1474; the whole Bible, in 1488; the first almanac, in 1489.

The third age, from 1500 to 1620, may be called the golden age of the Bohemian language. The cultivation of learning—in other countries, with only a few exceptions, the monopoly of the clergy—was in this favored land open to the whole nation. All branches of science were elaborated, and brought to an uncommonly high degree of improvement for that time. Gregory Hruby of Geleni translated the work of Petrarch 'De Remediis utriusque Fortunæ.' W. Pisecky translated from the Greek the 'Exhortation of Isocrates to Demonikos.' John Amos Comenius wrote 54 works, some of which were very excellent. He published his 'Janua' and an 'Orbis Pictus,' which were translated in his lifetime into 11 languages, have passed through innumerable editions, and are not yet surpassed. In all the north of Europe Comenius attracted attention by his projects for improving education, which were deliberated upon even by the diet of Sweden and the Parliament of England. The hymns of this and the earlier ages, part of which have been translated by Luther, may serve as standards for all languages. In Prague alone there were at this period 18 printing presses, in the country towns of Bohemia 7, and in Moravia also 7; many Bohemian books, too, were printed in foreign countries, as in Venice, Nuremberg, Holland, Poland, Dresden, Wittenberg, and Leipsic.

The fourth period begins with 1620 and ends with 1774. After the battle at the White Mountain, the whole Bohemian nation submitted entirely to the conqueror. The population of most of the cities and of whole districts migrated in order not to be false to their faith. More than 70,000 men, and almost the whole of the nobility, all the Protestant clergy, scholars, and artists, in general the most cultivated part of the nation, left their native country. Of these emigrants the greater part formed the flower of the army of Count Mansfield. Hence the Thirty Years' War depopulated Bohemia more than any other country, since these fugitives endeavored to regain their native country by repeated invasions. The fugitives established at Amsterdam, Dresden, Berlin, Breslau, and Halle printing presses, and sent to their brethren in Bohemia, Moravia, and Hungary a number of books, mostly new editions. Some Bohemians who observed the decay of their language strove to remedy it; as Pesina Z. Cechorodu; Joh. Beckowsky, who continued the Bohemian history to 1620; W. Weseley, who wrote a work on geometry and trigonometry, etc.; but the decay was too great to admit of being checked; the nobility had become strangers, and the government encouraged only German literature. From this time, there-

fore, the Bohemians wrote more in the German language.

In the fifth period, from 1774 to the present time, a new ray of hope shone on Bohemian literature, when, under the Emperor Joseph II., a deputation of secret Bohemian Protestants, trusting to his liberal views, made him acquainted with the great number of their brethren of the same faith. He perceived the necessity of introducing toleration, and hundreds of thousands of Protestants in Bohemia and Moravia came to light: their concealed works were printed anew, their classical language was again acknowledged and cultivated. Under this protection many men of merit, mindful of the fame of their ancestors, endeavored to cultivate anew all branches of the sciences, and to rival, if possible, the results attained by their more advanced neighbors. From about the year 1820 great activity was manifested by the Bohemian writers in the various departments of literature. A little before this Milton's 'Paradise Lost' was translated into Bohemian, and subsequently Shakespeare's dramas, or most of them, were likewise translated, the native drama being also cultivated. Kollar and Chelakovsky distinguished themselves in poetry, and perhaps even more Hynek Macha, whose poem 'May' is said to still maintain an influence over Bohemian poetry. Kollar and Chelakovsky were advocates of the Panslavic movement. The chief work of the former was 'Slava's Daughter,' a long lyric-epic poem. Several writers became well known as novelists, some of them following the lead of Sir Walter Scott. Jungmann (the translator of Milton), brought out a valuable 'History of Czech Literature,' and Schafarik his 'History of the Slavonic Language and Literature' and his 'Slavonic Antiquities.' Among more recent poets of note may be mentioned the names of Halek Heyduk and Neruda, but it must be admitted that few Bohemian writers have become generally known, even by name, to the European reading public.

Bohemond I., the son of the Norman adventurer Robert Guiscard, who rose to be Duke of Apulia and Calabria: b. 1056; d. 1111. He became familiar with warfare when a mere boy, took a prominent part in various expeditions to Greece and Illyria against Alexis Comnenus, and repeatedly defeated his troops with a very inferior force. As eldest son Bohemond naturally expected to succeed his father, but when the succession opened in 1085 Bohemond was absent in Greece, and his younger brother Roger, having obtained possession of the paternal inheritance, declared his determination to maintain it. A war between the brothers was followed by an arrangement which gave Bohemond nothing more than the principality of Tarentum. While assisting his brother at the siege of Amalfi he resolved to become a crusader, and without waiting to complete it he harangued the troops so effectually on the glory to be gained in the Holy Land that the great body of them at once joined his standard. Bohemond was soon on his march, and after encountering considerable difficulties reached the scene of action. The Crusaders had laid siege to Antioch, but had made little progress and were beginning to despair of success, when Bohemond found means to gain over an Armenian renegade, who undertook to introduce him and his men by night, and thus give them possession of the town. Bohemond

laid the matter before his fellow-chiefs, and in doing so stipulated that in the event of success he himself should be prince of Antioch. The Armenian kept his promise, and accordingly in 1098 Bohemond was installed in his sovereignty, which he retained ever after, and at his death transmitted it to his son, who assumed the title of Bohemond II.

Böhlag, bé'lä'n, Helene, German novelist: b. Weimar, 22 Nov. 1859. She shows now and then a leaning toward the romantic school, but on the whole her high power of description is realistic and her writings are imbued with passion. Among her novels are 'Under Death's Ban' (1882); 'Guilty of a Pure Heart' (1888); 'In Fresh Water' (1891).

Bohlen, Peter von, pä'tér fön bö'l'ën, German Orientalist: b. Wuppels, Oldenburg, 9 March 1796; d. Halle, 6 Feb. 1840. He spent the first 20 years of his life in straitened circumstances, but his talents and perseverance attracted attention, and he obtained admission to the Hamburg gymnasium. He afterward studied the Eastern languages at Halle and Bonn; and he obtained an appointment at Königsberg, first in 1825 as extraordinary, and afterward in 1830 as ordinary professor of Oriental literature. Bohlen has left many works, which fully support his title to the high place which he held among Oriental scholars. One of the most important is a work entitled 'Das alte Indien' (1830-1), not yet superseded by any other work on the same subject. The details of his life are given with great minuteness and honesty in an 'Autobiography' (1841), which is full of interest, and cannot be read without producing a full conviction that he was no less distinguished by his amiability in private life than by his literary acquirements.

Bohlen Lectures, a lecture course established in 1875 on a foundation of \$10,000 bequeathed by John Bohlen, a lay member of the Protestant Episcopal Church. They are delivered each year in Philadelphia, Pa., by eminent representatives of that Church. Among the most notable are those upon "The Influence of Jesus," by Bishop Brooks, and the "Fitness of Christianity to Man," by Bishop Huntington.

Böhm, bém, Theobald, Bavarian musician: b. Munich, 9 April 1798; d. Munich, 25 Nov. 1881. He is best known for his improvements in the construction and fingering of the flute. He wrote 'Ueber den Flötenbau und die neuesten Verbesserungen desselben' (1847), and 'Die Flöte und das Flötenspiel.'

Böhme, or Böhm, Jakob, yä'kōb bē'mè, one of the most renowned mystics of modern times: b. 1575, Altseidenberg, a village in upper Lusatia; d. Görlitz, November 1624. Boehme being the son of poor peasants, remained to his 10th year without instruction, and employed in tending cattle. Raised by contemplation above his circumstances, and undisturbed by exterior influences, a strong sense of the spiritual, particularly of the mysterious, was awakened in him, and he saw in all the workings of nature upon his mind a revelation of God, and even imagined himself favored by divine inspirations. He became afterward a shoemaker; and this sedentary life seems to have strengthened his contemplative habits. In 1594 Böhme became a master shoemaker in Görlitz, married, and continued a shoemaker during his life, but with-

drew himself more and more from the world. If we take into view his retirement, his piety, his rich and lively imagination, his imperfect education, his philosophical desire for truth, together with his abundance of ideas, and his delusion in considering many of those ideas as immediate communications of the Deity, we have the sources of his doctrine and his works. His first work, 'Aurora, oder die Morgenröte,' was written in 1616, and contains his revelations on God, man, and nature. This gave rise to a prosecution against him; but he was acquitted, and called upon from all sides to continue writing. One of his most important works is 'Description of the Three Principles of the Divine Being.' His works contain profound and lofty ideas, mingled with many absurd and confused notions, but the basis of his thought is the theory that everything exists and becomes intelligible only through its opposite. The first collection of his writings was made in Holland in 1675 by Henry Betke; a more complete one in 1682 by Gichtel (10 vols. Amsterdam), from whom the followers of Böhme, a religious sect highly valued for their silent, virtuous, and benevolent life, have received the name Gichtelians. Another edition appeared in Amsterdam in 1730 under the title 'Theosophia Revelata,' (2 vols.); the most complete in six volumes. In England, also, Böhme's writings have found many admirers. William Law published an English translation of them, two volumes. A sect, taking their name from Böhme, was likewise formed in England, and in 1697 Jane Lead, an enthusiastic admirer of his, established a particular society for the explanation of his writings, under the name of the Philadelphists. In very recent years his views have taken on fresh importance, his fundamental principle having been perceived as akin to that underlying the philosophical systems of Spinoza, Schelling, and Hegel. See Hartmann, 'Life and Doctrines of Böhme' (1893).

Bohn, bōn, Henry George, English publisher, of German parentage: b. London, 4 Jan. 1796; d. Twickenham, 22 Aug. 1884. On completing his education he worked for a time under his father, but about 1831 started business on his own account as a second-hand bookseller, and in 1846 he began the issue of his famous libraries. The first of these was the Standard, succeeded in the following year by the Scientific and the Antiquarian, in 1848 by the Classical, and from then till 1853 by the Illustrated, the Shilling, the Ecclesiastical, the Philological, and the British Classics libraries. The whole number of volumes contained in these series exceeded 600. In 1864 and subsequent years he sold all his copyrights and other business property, thus realizing a sum of nearly \$500,000. Among his own works were: 'The Origin and Progress of Printing' (1857); 'Biography and Bibliography of Shakespeare' (1863); 'Dictionary of Quotations' (1867); 'Handbook of Proverbs'; 'Handbook of Games'; 'Guide to the Knowledge of Pottery and Porcelain'; and editions of Lownde's Bibliographer's Manual and Addison's Works.

Bohol, bō-hōl', Philippines, an island belonging to the Visayas or Bisayas group. It has an area of about 1,300 square miles and an estimated population (1900) of 245,000. Sugar-cane is grown and the island is reputed rich in

gold deposits. The most important town is Tagbilaran, a port on the southwest coast. In the north is Calape. These ports were officially declared open to commerce 11 Dec. 1899. The Visayas dialect prevails throughout Bohol.

Bo'hor, an east African antelope (*Cervicapra bohor*), one of the reitboks.

Bohtlingk, bet'link, Otto von, German Sanskrit scholar: b. St. Petersburg, 11 June 1815; d. 16 April 1904. He received his education in his native city, and in 1853 removed to Germany. In 1842 he returned to St. Petersburg, but subsequently lived much in Jena and Leipsic. His chief work is a Sanskrit-German dictionary in seven volumes, prepared in conjunction with Prof. Roth of Tübingen (1853-75). In 1879-89 he issued a smaller edition giving the meanings (with considerable additions), but omitting the quotations.

Boiardo, Matteo Maria, mā-tā'ō mā-rē'a bō-yār'dō (COUNT OF SCANDIANO), Italian poet: b. near Ferrara, 1434; d. Reggio di Modena, December 1494. From 1488 to 1494, the period of his death, he was commander of the city and castle of Reggio, in the service of his protector, Ercole d'Este, Duke of Modena. This accomplished courtier, scholar, and knight was particularly distinguished as a poet. His 'Orlando Innamorato' (1496) is continued to the 79th canto, but not completed. He immortalized the names of his own peasants and the charms of the scenery at Scandiano in the persons of his heroes and his descriptions of the beauties of nature. In language and versification he has been since surpassed by Ariosto, whom he equaled in invention, grace, and skilful conduct of complicated episodes. Domenichi, Berni, and Agostini new modeled and continued the work of Boiardo without improving it. One continuation only will never be forgotten — the Orlando of Ariosto. In some of his works Boiardo was led by the spirit of his times to a close imitation of the ancients — for example, in his 'Capitoli'; also in a comedy borrowed from Lucian's 'Timon'; and in his Latin eclogues and translations of Herodotus and Apuleius. In his sonnets and *canzoni* (first printed at Reggio, 1499) he has displayed great talents as a lyric poet.

Boiars. See BOYARS.

Boieldieu, Adrien François, ä-dre-ën frän-swa bwäl-dyé, French composer of distinction: b. Rouen, 15 Dec. 1775; d. Groshois, 8 Oct. 1834. He early displayed great musical talent, and at 18 wrote an opera, 'La fille coupable,' which was performed with great applause. In 1795 he went to Paris, and rose rapidly in reputation, producing several operas and various other pieces which have become classical. Such as 'Le deux lettres'; 'La famille Luisse'; 'Calife de Bagdad'; and 'Ma tante Aurore.' When the Conservatoire de Musique was established he was nominated a professor. In 1803 he went to Russia as *maitre de chapelle* to the Emperor Alexander, but returned to Paris in 1811, and subsequently composed 'Jean de Paris' (1812); 'Le chaperon rouge' (1818); 'La Dame blanche,' his masterpiece (1825); 'Les deux nuits' (1829). The 'Calife de Bagdad'; 'Jean de Paris,' and 'La Dame blanche' still hold the stage and continue popular.

Boies, Horace, American statesman: b. Aurora, N. Y., 7 Dec. 1827. He went to Wisconsin in 1844; and after working on a farm returned, studied law and was admitted to the bar in 1849. He practised at and near Buffalo till 1867, becoming active in Republican politics during this period; and in the last year removed to Waterloo, Iowa, where he continued law practice. His opposition to the tariff and prohibition policy of the Republican party caused him to unite with the Democrats; and, in 1890-4, he served two terms as governor of Iowa, being defeated for a third term in 1893. He was a conspicuous candidate for the presidential nomination in the National Democratic conventions in 1892 and 1896; and in the campaign of 1896 he supported Bryan.

Boii, böi-i, a Celtic people, who at first inhabited Transalpine Gaul. Their original seat is supposed to have been between the upper Saône and the higher parts of the Seine and Marne. They migrated to Cisalpine Gaul, crossed the Po, and established themselves between it and the Apennines, in the country previously occupied by the Umbrians. They are found, 396 B.C., engaged along with the Insubres and the Senones, two other tribes of Cisalpine Gaul, in the capture and destruction of Melpum, a neighboring city, of which the site and history are unknown. They united their forces with the Etruscans, 283 B.C., after the defeat of the Senones, and were defeated by the Romans at the Vadimonian Lake, the scene of a previous defeat of the Etruscans. After another defeat they made a peace with the Romans, which was preserved for 45 years, when the occupation of the territory of the Senones by the latter led to another war, in which the Boii were again defeated. At the commencement of the second Punic war, 218 B.C., they again attacked the Romans and supported Hannibal. From this period they were engaged in almost constant war with the Romans till they were completely subdued by Scipio Nasica, 191 B.C. Many of them were put to the sword; the remainder were at length compelled to migrate, and crossing the Alps found a refuge among the Tauriscans, a kindred tribe in the territory of modern Bohemia, to which the Boii have given their name. They were afterward driven out or exterminated by the Dacians (some say the Marcomans). Part of them migrated about 58 B.C. to Bavaria. The Boii, like the other Gauls, were a people of considerable civilization, possessing a strong love of independence, and formidable from their military disposition and virtues.

Boil, a superficial or deep localized inflammatory process of the skin leading to the destruction of tissue and the formation of pus. In practically all instances some form of infection by a micro-organism, usually the *Staphylococcus pyogenes aureus*, is present in boils. In the superficial varieties, the bacteria enter the hair follicles or the sebaceous glands and travel down beneath the skin and here either set up a process of destruction or continue one already begun by a wound. There results a local swelling; with exquisite tenderness, and later a pointing and discharge of the purulent detritus from the boil. In the deep-seated varieties similar processes are in action, but the heading and discharge of the boil is de-

layed. The marked tenderness is due to the involvement of the nerve fibres in the tissues immediately surrounding the inflammatory centre. The predisposition to the formation of boils varies widely, some people being particularly prone to them. They are apparently more liable in those who are "run down," or in those whose tissues are non-resistant. Boils are of commoner occurrence following the winter time of housed individuals, combined with the renewed activities of the skin in the warm spring atmosphere, and they occur following the depressed states of many diseases, and particularly as a result of excessive athletic exercise, "over-training." Faulty diet and hygiene are responsible for many of them. In their treatment attention to the intestines is imperative. Tonics, particularly those containing some forms of sulphur, are of value. Proper hygiene of the skin is imperative. For the immediate treatment heat is helpful. This is usually applied as a hot flax-seed poultice, preferably, combined with a mild antiseptic; two per cent carbolic acid, being excellent. Early and complete incision is also advisable.

Boileau Despréaux, Nicolas, nik-ō-la bwä-lō-dā-prā-ō, French poet of distinction: b. Paris, 1 Nov. 1636; d. there, 13 March 1711. He applied himself at first to the study of the law and afterward of theology, but devoting himself eventually to the pursuit of literature, he produced, within the space of 40 years, a vast number of works, the most important of which is that on the art of poetry, establishing an æsthetic code for all forms of poetical composition. His satirical poem, 'Le Lutrin,' and the 'Dialogue des héros de roman,' must also be particularly mentioned. His other writings comprise translations of the classics, miscellaneous effusions on art, music, and poetry, and his famous epistles, of which those treating of 'Le respect humain,' 'La connoissance de soi-même,' and 'Plaisirs de la campagne' are the best. When Boileau began to write, Montaigne, Pascal, Malherbe, Corneille, Molière, La Fontaine, and other eminent authors, had already made their appearance; yet the people were slow to appreciate the genius of the new school, to which they preferred the previous mediocre and imitative writers. Boileau's great achievement was to cure this perversion of taste. Like his friend Racine, he was historiographer of Louis XIV., and the recipient of an annual pension of 2,000 francs. His admission to the French Academy did not take place before 1684, owing to his attacks upon some of the members. The latter part of his life was passed in neglect and troubles, which accelerated his death. He left the reputation of a genial, high-minded, and generous man. The best edition of his works is by Gidel (1870-3). See Deschanel, 'Le romantisme des classiques,' 4th series (1888); Faguet, 'XVII. Siècle, Etudes littéraires' (1887); Hemon, 'Cours de littérature' (1889-95); Lanson, 'Boileau' (1892); Morillot, 'Boileau' (1892).

Boiler, in steam engineering, a closed vessel for the generation of steam under pressure. In days when steam pressures did not exceed a few pounds to the square inch, many forms of boiler were used, that are now out of the question, on account of the intrinsic weakness of their forms. At the present time,

BOILER

when steam pressures are often carried as high as 150 or 250 pounds to the square inch, the strictest attention must be paid to every trifling detail of design and construction, in order to ensure the safety of the structure. The fanciful shapes that prevailed in the days of Watt and other early steam engineers have perforce disappeared, and given place to a limited number of standard types that have been found to be capable of withstanding the severe conditions of modern practice. The types at present in use may be divided into two general classes, according as they are "internally fired" or "externally fired"; that is, according as the fire which furnishes the energy for the formation of steam is contained within the general contour of the boiler, or is situated externally to it. Internally fired boilers are the rule in England, but a large majority of the boilers in use in the United States are fired externally.

Internally Fired Boilers.—The Cornish and Lancashire boilers are the commonest internally fired types. Each consists of a cylindrical shell with flat ends or "heads." In the Cornish type the boiler is traversed from end to end by a large flue, which is often corrugated, to increase

smaller size of its flues. The Galloway boiler does not differ in any essential particular from the Cornish or Lancashire types, except that its flues are crossed by conical-shaped water tubes, which serve the double purpose of increasing the heating surface, and of stiffening the flues that they traverse. The conical shape is adopted for the cross-tubes chiefly on account of the ease with which tubes of this form can be put in position, by passing the flange of the smaller end through the opening to which the larger end is to be riveted.

The Scotch, or cylindrical marine boiler, shown in Fig. 1, is a very common type in marine practice. It contains several furnaces (three in the illustration), which are usually corrugated. These furnace-flues do not pass through the entire length of the boiler, as in the Cornish and Lancashire types, but each is connected, within the boiler, to a separate "combustion chamber." The products of combustion pass from the furnace back into the combustion chamber, and then return to the front end of the boiler through banks of small tubes which occupy the water space of the boiler, above the furnace. A "breaching" (or hood) of sheet steel, secured to the front of the boiler, then receives them, and conducts them to the stack.

Among the kinds of internally fired boilers that are more familiar to the engineers of the United States, the vertical tubular boiler and the locomotive boiler deserve special mention. The vertical tubular boiler consists of a cylindrical shell, with flat heads at the top and bottom, and traversed by a large number of small vertical tubes. The Manning boiler, shown in Fig. 2, is a good example of this type. At the lower end, the shell of this boiler is enlarged to provide a greater space for the fire-box than could be had if the shell were of the same diameter all the way. Another object that the designer had in view, in increasing the diameter of the shell in this way, was to give the boiler a certain degree of elasticity. The tubes are often hotter, in service, than the outer shell; and hence they tend to expand more, and thus throw stresses upon the heads and the tube ends. The reversed flange by which the main shell is secured to the fire-box is supposed to yield sufficiently, under the bending stress thus thrown upon it, to relieve the more vulnerable parts of the boiler from the expansion strains to which they would otherwise be subjected. The fire-box of the Manning boiler is surrounded by an annular space containing water, the inner plates of this space (or "water leg") being secured to the outer ones by screw stay bolts that are spaced evenly, at short distances, so that they form the corners of a system of small squares. These bolts are supposed to be screwed into each of the shells of the water leg, and afterward riveted over at both ends. They are also commonly made hollow, or drilled through lengthwise with a small hole, so that if one of them should break or corrode away seriously, the escaping steam or water would attract the attention of the fireman. Vertical tubular boilers are particularly useful when the available floor space in the boiler room is small; but they are often hard to clean out, and hence are not to be recommended when the water supply is known to form considerable deposits of scale matter. Such scale matter, in whatever part of

FIG. 1. The "Scotch," or Cylindrical, Marine Boiler.

its strength. The fire is built within this flue, upon a suitable grate at one end of the boiler; and the gaseous products of combustion, after passing through the flue, are returned along the outside of the shell, so as to give up still more of their heat to the water in the boiler. The large flue in the Cornish type is an element of weakness, since the tendency of a flue to collapse through the action of an external pressure increases very rapidly with the diameter of the flue. To guard against collapse, the long flue is often provided with strengthening rings, which are riveted to it externally at short intervals. The Lancashire boiler differs from the Cornish type chiefly in having two comparatively small flues in the place of a single large one. Such a construction is intrinsically stronger, and since there is a fire in each of the flues, the fuel can be replenished, and the fires cleaned, alternately. This implies a greater steadiness of pressure, and less strain upon the boiler from the chilling action of the comparatively cold air that enters and strikes against the heated flue-walls when the fire doors are opened. The Cornish boiler is cheaper to build, and the Lancashire boiler is harder to fire, owing to the

BOILER

the boiler it is formed, will eventually fall upon the lower tube sheet, or else into the water leg. That which falls into the water leg will do no great harm unless it is allowed to accumulate to an unreasonable extent. Handholes are

on the same level as the lower tube sheet, for a like purpose; but it is not so easy to remove the scale from this sheet as it is to remove it from the water leg. That which lodges around the edges of the tube sheet can be removed without any great trouble, but the deposit that lies toward the middle of the tubes can hardly be got at from the handholes. Yet it is of the highest importance that the tube sheet should be kept free from such deposits, because otherwise the ends of the tubes will become overheated and loosened, and serious mischief, or even disastrous explosion, may follow.

The locomotive boiler is built in a great variety of forms and proportions, but the fundamental principles of design are substantially the same in most of them. Like the vertical tubular boiler, it has a fire-box that is surrounded by a water leg on all sides, though it is open at the bottom for the discharge of ashes, and for the admission of air for combustion. The inner and outer walls of the fire-box are connected by stay-bolts, and the upper sheet of the furnace (technically known as the "crown-sheet") is supported in some efficient manner, so that the pressure of the steam shall not force it down out of position. The support thus necessary for the crown-sheet is sometimes afforded by running "sling stays" from it to the neighboring parts of the outer shell, and sometimes by providing parallel, horizontal girders over the sheet, these being secured to the crown-sheet, at short intervals, by means of hangers, or long, thimble rivets. Not infrequently these two methods of support are combined in the same boiler, as suggested in the illustration (Fig. 3). The products of combustion pass forward from the furnace, through a bank of small tubes that conduct them to a "smoke-box" or "extension" at the front end, to which the stack is attached. When the locomotive type of boiler is used in stationary practice, the draft required for combustion is provided by a chimney or tall stack, as in other types of stationary boiler; but when used in railway service it is impossible to obtain the draft in this manner, and a "blast-pipe" is therefore provided, through which the exhaust steam from the engine cylinders is discharged up the stack. The gaseous products of combustion are expelled from the "front extension" by the blast of steam, and an equivalent quantity of air is drawn up through the fire. The draft produced in this way is quite powerful. "Baffle plates" are therefore provided in the furnace, in many cases, to deflect the hot gases that come from the fire, and bring them into contact with a considerable portion of the surface of the fire-box, before they pass out into the tubes. The weakest points about the locomotive type of boiler are the crown-sheet and the stay-bolting. If sediment lodges upon the crown-sheet, and thereby keeps the water from direct contact with the metal there, overheating is sure to occur, and the sheet may become so softened and burned as to lose its strength, tear away from its fastenings, and permit the entire contents of the boiler to be discharged into the furnace. Many of the explosions of locomotive boilers are due to this action. The stay-bolting at the sides of the fire-box is likewise a source of frequent trouble, because it is found that the stay-bolts sometimes corrode away very rapidly, so that they are in reality badly wasted and weakened,

FIG. 2. The Manning Boiler.

provided along the bottom of the water leg, on the outer shell, and these should be opened as often as experience with the particular feed water that is used indicates to be necessary, and the water leg thoroughly freed from scale and mud. Handholes should also be provided

BOILER

when the engineer in charge believes them to be still sound and strong. As in the vertical boiler, the stay-bolts are made hollow so that they may automatically give notice of breakage by leaking. This artifice is helpful, but unfortunately it does not invariably work as it is intended to, and broken or badly corroded stay-bolts exist, not infrequently, without giving the alarm that they are supposed to give.

Externally Fired Boilers.—The commonest type of externally fired boiler, in the United States, is the horizontal tubular. The standard

underneath the boiler shell to the "combustion chamber" at the rear, after which they rise and return to the front end through the tubes. They then enter the "smoke box" at the front end, and finally pass upward into the flue that leads to the chimney. The weight of the boiler is sustained by means of cast-iron (or steel) projections, or "lugs," that are not shown in the illustration, but which are riveted to the shell, and rest upon the side walls of the brick setting. Three pairs of lugs are often provided, but two pairs are sufficient except when the

FIG. 3. Locomotive Boiler.

design of this boiler, according to the Hartford Steam Boiler Inspection and Insurance Company, is shown, with its brickwork (or "setting") partially torn away, in Fig. 4. It con-

FIG. 4. Horizontal Tubular Boiler.

sists of a cylindrical shell, usually composed of three courses or "rings" of plates, riveted together. The circular joints in these boilers are almost invariably single-riveted; but the longitudinal joints are double-riveted, triple-riveted, or riveted in some even more substantial manner, according to the pressure that the boiler is to carry. The longitudinal joints, which are not shown in the engraving, should be high enough to be well out of the way of the hot gases from the furnace. A multitude of tubes extend through the boiler from end to end, and the furnace gases pass from the furnace back

boiler is very long; and two pairs can be brought to a good bearing upon the side walls more readily than three. The boiler should be "anchored" by the front pair of lugs, and the rear pair should be provided with rollers so that the boiler may expand and contract freely, without producing strains in the setting or in itself. The course of the feed-pipe, through which water is introduced into the boiler, is indicated quite plainly in the engraving. If there are several boilers set together in one battery, the main feed-pipe runs along the fronts, just under the projecting ends of the boilers. From this main feed-pipe a branch pipe is taken off for each boiler. The branch pipe is taken off on the left-hand side of the boiler, and near the main pipe it is provided with a ground union, or with a flanged connection. Immediately above the union there is a check valve, and above this is the globe valve which controls the feed. The feed pipe enters the boiler just above the tubes, and passes down the boiler on the inside, nearly to the back head. It then crosses over to the right-hand side, and discharges downward between the tubes and the shell. It is found by experience that when feed water is introduced in this way it becomes heated almost to the temperature of the water in the boiler before it is discharged, so that the annoying and often dangerous effects that are produced when the shell is chilled by cooler feed-water are entirely avoided. On large boilers the feed-pipe should have a diameter of at least an inch and a half. The blow-off pipe (which is used for drawing off the contents of the boiler) should be located at the rear end, and

BOILER

should enter the boiler at the bottom, and not through the back head. To strengthen the construction, the shell should be reinforced where the blow-off enters it, by a ring of boiler plate securely riveted in place, about the point of attachment of the blow-off. The neglect of this simple matter of reinforcement has led to many serious accidents, through the blow-off pipe pulling out and permitting the contents of the boiler to be discharged through the opening so made. As the blow-off is exposed to the action of the fire, it is also important that it should be encased in some sort of a protecting sleeve, as indicated by the dotted lines. A piece of larger pipe, slipped over the blow-off, is often used for this purpose, but it has the disadvantage of rendering the blow-off itself inaccessible for examination. A piece of asbestos rope coiled about the pipe is equally satis-

straight passage through them, and are therefore likely to catch and retain pieces of scale, which often prove to be very troublesome impediments. It should be mentioned that those parts of the heads of a horizontal tubular boiler that lie above the tubes are intrinsically weak, and must therefore be sustained in some manner. The necessary support is usually secured by running braces from the heads to the side of the boiler shell, though sometimes the braces are run through the entire length of the boiler, from one end to the other.

The horizontal tubular boiler has many excellent points, not the least of which is that it is accessible for examination and cleaning in practically every part. No boiler can be expected to work ideally when the feed water is bad, but the horizontal tubular type gives as good service, even under this trying condi-

FIG. 5. The Babcock & Wilcox Water Tube Boiler.

factory, and permits of easy inspection of the pipe. The blow-off pipe of a boiler that is properly cared for is not likely to burn nor to become otherwise injured. Most of the accidents from the burning of such pipes have been primarily due to permitting the pipes to become choked up with mud or scale, so that water could not enter them freely from the boiler, to keep them properly cool. This may be almost certainly avoided by opening the blow-off (say) twice a day for a moment or two, until any sediment that may have fallen into it has been thoroughly swept out. The blow-off pipe is often so arranged that the elbow comes in the combustion chamber; but this is not good practice, and it is much better to carry the pipe down until it passes below the floor of this chamber. The pipe itself should be about two inches in diameter. It should be provided with a plug cock or with a gate valve, but a globe valve should never be used upon it, since valves of this type do not have a

tion, as can be had from any known type. Its weak points are (1) that it is not so well adapted to extremely high pressures as some of the water-tube types, of which one will be presently noticed; and (2) when it ruptures (as must happen occasionally with every type of boiler) the explosion is likely to be considerably more destructive than the explosion of a sectional boiler, because the large quantity of energy that it contains is liberated more suddenly.

Another class of externally fired boilers that is becoming more and more widely used, both in the United States and Europe, is the "water-tube" type, which is characterized by the fact that its tubular elements contain water, instead of serving for the transmission of the furnace gases, as in all the other forms that have been considered above. One of the best-known boilers of this class is the Babcock and Wilcox, which is shown in Fig. 5. This boiler is built up of lap-welded wrought-iron tubes, placed

BOILER

in an inclined position, and attached, both at the front and at the rear, to an upper drum that is made of extra thick steel or iron plates, and double-riveted, or riveted with a butt-strapped joint. The tubes are not vertically over one another, but are "staggered," so that each tube comes directly over a space in the row below it. The boiler is suspended from wrought-iron girders, which rest upon iron columns that are entirely independent of the brickwork; and hence the brickwork may be repaired, or may even be removed altogether, without disturbing the boiler itself. The fire is situated under the front or higher end of the inclined tubes, and the products of combustion are guided by division plates and bridges so that after rising from the fire grate they pass between the tubes to the combustion chamber under the drum, then downward among the tubes again, and finally upward and to the chimney. This devious course, as well as the staggering of the tubes, is intended to bring the hot gases into intimate contact with the tubes at every point. As the water in the boiler becomes heated, it rises toward the higher end of the tubes, becoming meanwhile partially converted into steam. The column of mixed water and steam ascends into the drum, where its constituents separate, the steam remaining in the drum, while the water flows to the rear, where it passes down through the long, upright tubes, and so completes the circulation.

Water-tube boilers are now used to some extent in marine work, and especially in the naval service. Attention has been particularly directed to this branch of the subject by the recent elaborate investigations of the Commission appointed by the British Admiralty, for the purpose of recommending a standard type of boiler for use in the British navy. (See 'Engineering News,' 4 Sept. 1902, page 176.) The Belleville boiler, which has heretofore been somewhat extensively used in that service, is represented, diagrammatically, on plate. It consists essentially of a series of water-tubes, slightly inclined to the horizontal, and opening at the bottom into malleable iron collector boxes, and at the top into a drum to which the main steam pipe is attached. The feed water is introduced at the middle of the upper drum, and is injected under a pressure in excess of that which is carried upon the boiler itself. To prevent the comparatively cool feed water from entering any of the tubes in which steam is generated, these tubes are caused to project at least eight inches into the drum. The feed passes down through return pipes at the sides of the boiler, and enters the tubes below, after its temperature has been raised by the heat of the furnace sufficiently to prevent injury from contraction strains. The proper regulation of the feed-water supply is one of the difficult practical points about the Belleville boiler; and to overcome it as far as possible an ingenious automatic feed device is provided. As will be understood from an inspection of the engraving, there is little or no true circulation in boilers of this type. The tube-groups discharge a mixture of steam and water into the drum, where the steam is supposed to be freed from the water by the aid of a system of baffle plates that are not shown. An economizer is placed in the stack above the boiler in the most approved modern installations, the construction of the

economizer being similar to that of the boiler itself, except that the tubes composing the elements are smaller. The Commission already referred to reported somewhat unfavorably upon the Belleville boiler, but did not suggest any other special type of water-tube boiler for general use aboard ship. It inclined rather toward cylindrical boilers for ordinary purposes, with auxiliary water-tube boilers for emergencies.

All boilers are supposed to be provided with certain appliances intended to secure safety, and uniformity of working. Noteworthy among these are the safety valve, and the gauges that indicate the pressure of the steam and the position of the water level. These are described under separate headings.

The "horse-power" of a boiler is often spoken of; but the term is a loose one, without any definite significance, because the horse-power that can be realized from a boiler depends to a very great extent upon the engine that is used to develop the power, and upon how hard the boiler is forced. The Centennial Commission adopted, as the definition of a horse-power (when that expression is used in connection with a boiler), the "evaporation of 30 pounds of water per hour, when the temperature of the feed water is 100° F., and the pressure of the steam is 70 pounds per square inch, as read from the gauge."

Steam boilers may explode from any one of a great variety of causes. Of these three are specially worthy of mention: (1) The boiler may be poorly made or poorly designed, so that even when it is new it is not capable of safely withstanding the load that is put upon it. All boilers, however well made, should have a "factor of safety" of five; that is, they should be able to sustain a pressure five times as great as the regular working pressure, before bursting. (2) A boiler, originally good, may be wasted away, either locally or generally, by corrosion or other form of deterioration, or it may develop defects in service, which detract from its original strength sufficiently to lead to explosive failure. Competent periodical inspection will materially lessen the liability to explosion from causes of this sort. (3) The water in the boiler may become low, through neglect or through the failure of the feed-apparatus, so that the metal becomes overheated or burned, and loses its strength. This is the cause almost invariably assigned, by the general public and even by minor "experts," when the boiler explosion occurs, and the attendant is frequently censured for his carelessness when the explosion was really due to some totally different cause. When an explosion is attended by great manifestations of force and energy, it is safe to conclude that a plentiful supply of water was present; for a boiler full of heated water contains vastly more energy than one that is merely filled with steam at the same temperature. (See Thurston, 'Steam Boiler Explosions.') Pound for pound, steam contains more energy than water, when the two are at the same temperature; but cubic foot for cubic foot (and this is the way that the comparison should be made in reasoning about a boiler explosion), the water has an enormous advantage, owing to its greater density.

For further details concerning boilers, consult F. R. Hutton, 'The Mechanical Engineering of Power Plants'; J. G. A. Meyer, 'Modern

Boiler Shop Terms. The following list of terms includes the principal terms and phrases commonly employed in connection with the work of the design, construction, and use of steam boilers.

Specific information relative to boiler fittings such as valves and cocks may be found under the title **VALVES AND VALVE TERMS**.

Information relative to the design and construction of locomotive engine boilers, and concise descriptions of their various parts, fittings, and accessory appliances and devices such as pumps and injectors, and cocks, valves, and feed-water heaters, will be found carefully treated under the title **LOCOMOTIVE, DESIGN AND CONSTRUCTION OF THE MODERN**.

Special information relative to the general methods and operations of constructive work such as the boring, drilling, and punching of holes, and the joining of plates by riveting and welding, will be found under the title **WORK-SHOP TERMS**; while the definitions of the various terms and their abbreviations such H.P.—Horsepower, and B. T. U.—British Thermal Units, etc., may be found under the title **ENGINEERING AND STRUCTURAL TERMS** in this encyclopedia.

ACIDULATED WATER.—Water in which acids have been generated by the introduction of too much tallow into the boiler to prevent incrustation. Its use tends to produce boiler corrosion.

AIR CASING.—The enclosed space which envelops the uptake of marine boilers and prevents the loss of heat therefrom by radiation.

AIR SPACES.—The openings between the fire-bars of engine boilers.

ANTI-FOULING COMPOSITIONS.—See Incrustation.

ASH PIT.—That part of the furnace of a stationary boiler which lies below the fire-bars and immediately in front of the fire-door. It is provided for the reception of the ashes which fall through the bars, and constitutes the main draught entrance of the furnace.

BAFFLE PLATES or BAFFLERS.—The plates provided in the fire-boxes and flues of steam boilers for throwing the flames and hot gases against the best heating surfaces. Also to admit air above the fire, and to prevent the burning and buckling of the door of the furnace.

BALLOONING.—The process which takes place within a steam boiler when a sediment of fine mud and scale is carried to the surface of the water by the ebullition of the bubbles of steam. Large boilers are provided with "scum-troughs" for collecting this sediment.

BANDING or BONDING.—The securing of the lagging around steam cylinders and boilers with broad encircling bands of sheet-brass or hoop-iron.

BAR-STAYS.—Solid screwed stays as distinguished from tube-stays or stay-tubes.

BEARING RING.—The ring which forms the support of the fire-bars in a vertical boiler.

BLAST.—The volume of air forced artificially into the furnaces of marine boilers to quicken the combustion.

BLEEDING.—The red streaks of rust which soak through the scale adhering to the inner surfaces of boilers and serve to indicate the presence of corrosion in the plates underneath.

BLISTERS.—Defects in boiler plates of poor quality, caused by the retention of cinders or sand therein during the rolling process.

BLOW-OFF or BLOW-OFF COCK.—The pipe and cock situ-

ated at the lower part of the boiler by which the boiler is blown-off or emptied of its contents to prevent incrustation. In horizontal boilers of the Lancashire and Cornish type, a pipe called the blow-off bend connects the cock with the blow-off seating through which the boiler is blown-off into the ash pit.

BEAR or BOILER BEAR.—See Punching Bear.

BOTTLE-TIGHT.—The seams, rivets, fittings, and mountings of a steam boiler are said to be bottle-tight when the joints are so close and perfect that there is not the slightest leakage through them under the application of the water or the steam tests.

BOTTLING-UP.—The temporary confinement of steam in the tubes of a sectional boiler caused by its being generated too rapidly.

BOWLING HOOP.—A ring of arch-shaped section, and provided with flanges for the reception of rivets, employed for uniting the sections of furnace shells in horizontal boilers.

BREAKING JOINT.—The manner in which the longitudinal seams of the plates of the boiler are arranged so as to act as supports for each other.

BRIDGE.—The barrier of brickwork built upon a girder-like casting which stretches across the fire-box of an engine boiler at the farther end of the grate. It serves to throw the flames upwards to the heating surface, and also prevents a too rapid escape of the heated gases.

BRINE PUMP.—A pump employed for periodically drawing off a certain amount of water from a marine boiler to prevent saturation.

BUNKER PLATE.—A sheet-iron plate which encloses the bunker or space which holds the coal or coke used in the furnace of an engine boiler.

BURSTING.—The destruction of a boiler by an excess of internal pressure, as distinguished from collapsing, or the failure of a boiler under the force of an external pressure.

CALORIMETER.—The sectional area of a boiler flue, given in square inches.

CAPACITY.—See Heating Surface.

CARBONATE OF LIME.—The principal substance which causes the incrustation of steam boilers and water-pipes. It is held in solution in the water as a bicarbonate by the excess of carbonic acid. When the boiler is heated the excess of acid is driven off, and the carbonate is precipitated in the form of a muddy deposit which hardens in the presence of heat into the form of an injurious scale.

CAULKING.—The process of burring or driving up the edges of boiler plates along the riveted seams to make them steam and water tight. The caulking of the joints between boiler shells and the flanges of cast-iron man-holes, and safety and stop valve seatings, is accomplished by means of caulking-strips or strips of sheet metal interposed between the wrought-iron of the shells and the cast-iron of the pieces attached thereto. This is rendered necessary on account of the impossibility of caulking the cast-iron.

CHIMNEY.—The tube or funnel through which the waste steam and smoke escapes from an engine or boiler into the open air. Its proportions bear a definite relation to the grate area, and vary in the different types of engines.

CIRCULATING TUBES.—The cross tubes of vertical boilers, or the ordinary forms of tubes used in multitubular boilers or surface condensers.

CIRCULATION.—The circulation in a steam boiler is caused by the bubbling up of the lighter boiling water from the heating surfaces through the heavier cooler water in the upper portions which descends and thus comes in contact with the heating surfaces. Efficient circulation is necessary to the rapid generation of steam, and for the prevention of incrustation. It is promoted by the use of properly arranged water tubes.

CLINKERING.—The removal of the clinkers or other vitrified material from the fire in the boiler, periodically.

CLOTHING.—The felt and wood coverings placed around boilers to prevent loss of heat by radiation.

COATING.—Non-conducting compositions of felt, silicate cotton, asbestos, etc., which are smeared or placed around steam boilers while the substances are in a plastic state, and which become subsequently hardened by the heat, and prevent the loss of heat from the boiler by radiation.

COLD WATER TEST.—The hydraulic test, for pressures only, applied to steam boilers, as distinguished from the hot water test.

COLLAPSE.—The destruction of the tubes and fire-boxes of steam boilers by external pressures which cause them to fail by bending or crumpling inwardly.

COLLECTOR.—A cylindrical vessel enclosed in a steam boiler for the purpose of collecting the sedimentary matter contained in the water, which if allowed to

BOILER SHOP TERMS

- remain in the water would produce injurious scale and incrustation. The material thus collected is removed by being blown-out at intervals.
- COMBINED STEAM.**—Dry and wet steam allowed to mingle together before being used. Its use, at a temperature not exceeding 310° Fahr., tends to diminish the evils of corrosion and priming.
- COMBUSTION CHAMBER.**—That portion of a boiler flue in which the gases liberated by the action of the fire are burned. It lies between the grate and the smoke-flue.
- CORROSION.**—The rusting or oxidation of metals by contact and chemical union with oxygen in the presence of water. Boiler corrosion is either internal or external. Internal corrosion is due to the presence of acidulated water, or to superheated steam in the steam-chamber. External corrosion results from leakage and from contact with damp foundations and seatings.
- CORRUGATED FURNACE TUBES.**—Furnace tubes which are ribbed in their longitudinal sections. They are extensively used both in land and marine boilers. The elastic character of the corrugations absorbs the linear expansion of the tubes under the influence of heat, and thus prevents the strains which tend to bulge the end-plates of the boiler.
- CROSS-TUBES.**—The heating tubes in a vertical or cross-tube boiler. They pass through the fire-box, and therefore, being surrounded by the fire, materially assist in maintaining a rapid circulation of the water. They are cleaned through a mud-door placed opposite the end of each tube.
- CROWN.**—The boiler crown proper, is the uppermost plate in the shell of the boiler. It is formed either in the shape of a hollow disc flanged around the edges, and by which it is riveted to the outer shell-plates, or it is made flat and secured in place by means of stays. That portion of the crown which lies over the top of the furnace or inner shell is usually designated as the fire-box crown.
- DAMPER.**—The plate, cover, or valve, employed for regulating the amount of draught in a boiler or furnace flue. The contrivance is usually balanced with a weight called the damper-weight which assists in its adjustment.
- DEAD-PLATE.**—The cast-iron plate which lies immediately within the furnace door of an engine boiler. It is provided for the reception, and for the partial coking of the coal before it is passed forwards onto the grate.
- DEAD-WATER.**—The water which lies below the heating surface of the boiler, and, therefore, is in comparatively slow circulation. In some forms of boilers the flues are brought forwards under the bottom so as to heat the dead water and thus induce a more rapid circulation therein.
- DOLLY.**—A riveting tool used by boilermakers for holding under the heads of rivets during the act of riveting.
- DOUBLE-ENDED BOILER.**—A marine boiler provided with furnaces and flue doors at each end, and is therefore fired from each end.
- DRY STEAM OR SATURATED STEAM.**—Steam which has not been superheated, nor mixed with the water of priming. It is the most suitable form of steam for use in engine cylinders.
- ECONOMIZER.**—An arrangement of pipes by means of which the feed-water for steam boilers is heated up to, or higher than, the boiling point.
- EVAPORATIVE VALUE.**—The relative capacities of the various types of steam boilers to vaporize water, expressed in horse-powers, units of work, or in thermal units.
- EXPANDING.**—The tightening of boiler tubes in the tube plates by expanding or opening out their ends.
- EXPANSION HOOP.**—The metal ring which is used in the forming of an expansion joint provided in long boiler flues for the purpose of taking up the linear expansion due to heat.
- FEEDER.**—The agency by which the feed-water supply of a boiler is maintained. Usually, it is some form of force pump, or an injector.
- FIRE-BARS.**—The grate-bars of the furnaces of engine and other boilers.
- FIRE-BOX.**—A term which is specifically applied to the furnaces of locomotive and vertical boilers.
- FIRING.**—Boilers are fired both internally and externally. Internally fired boilers are those in which the fuel is consumed in a tube or arrangement of tubes within the boiler itself. The Cornish with one flue, the Lancashire with two flues, the locomotive boiler and other forms of boilers with many internal tubes, the vertical boilers with uptake and cross-tubes, and the marine boilers with return flues are of the internally fired class. Externally fired boilers are those which are not provided with internal fire-boxes or furnace flues. The egg-end, the balloon, the haystack, and the wagon boilers are of this class. They are practically obsolete.
- FIRE TUBE BOILER.**—A multitubular boiler, as distinguished from a sectional boiler or a water tube boiler.
- FITTINGS.**—The fittings of a boiler comprise the man-hole and mudhole doors, the fire-bars and their rings and bearers, the furnace doors, the dampers and frames, etc.
- FLAME PLATES.**—The crown plates of a boiler flue or fire-box.
- FLANGING.**—The bending over of the edges of the boiler plates so as to form narrow flanges by which they are attached to each other either by riveting or by welding.
- FLOAT.**—A buoy employed to indicate the height of the water in the boiler. It is usually made of stone or of iron, and is rendered buoyant by means of a counterpoise the proportion of which relatively to the specific gravity of the float renders the float quite as susceptible to the variations in the water level as a float of wood. Its movements are observed by means of the float gauge attached to the boiler.
- FLASH BOILER.**—A steam boiler composed of a large number of small tubes which are kept red-hot, and unto which the water is fed in the form of a spray which is instantly converted into steam. They are principally used in connection with steam driven automobiles.
- FLUES.**—The flues of a boiler are the arrangements or parts which carry off the waste gases and smoke, and produce the draught.
- FLUE PLATES.**—The ends of horizontal boilers to which the flues are attached, or the fire-box crowns of vertical boilers.
- FLUE SURFACE.**—The area of the flues as distinguished from the grate-area.
- FOLLOWING JOINTS.**—The lap joints of the rings which compose a cylindrical boiler. As all of the joints lap in the same direction, they are called following joints.
- FULLERING.**—A mode of caulking boiler plates. It differs from caulking proper in that the entire edge of the plate is hammered over instead of only a portion of the edge.
- GRATE.**—The area which contains the burning fuel in the furnace of an engine boiler. The grate-area is the number of square feet covered by the grate-bars or fire-bars which compose the grate. It is equal to the area over which full combustion can take place, and is usually estimated in relation to the weight of coal burned.
- GROOVING OR FURROWING.**—The cutting or corroding which takes place in the seams of improperly stayed boiler plates. It is partly due to the leverage to which those parts are subjected, and partly to the action of acids in the lines of strain.
- GROSS SECTION.**—The total number of inches contained in the circumference of a steam boiler.
- GUSSET OR GUSSET STAY.**—A triangular piece of wrought-iron or steel employed to support the flat ends of boilers. Large boilers are provided with five gusset stays at each end, which are secured to the end-plates and the shell by angle-irons.
- HOLES.**—When the rivet holes in boiler plates are punched or drilled so inaccurately that they do not coincide within an amount equal to one-half their diameters when the plates are brought together, they are called half-lap or half-blind holes. When the holes do not correspond within the extent of a whole diameter they are called blind-holes. In riveting, such holes are either pulled together with a drift, or they are reamed out and larger rivets inserted.
- HAND HOLES.**—Holes provided in the shells of steam boilers in cases where a mudhole is impracticable, through which the hand may be introduced for purposes of cleaning and repair.
- HARD WATER.**—Water which contains a large percentage of carbonate and sulphate of lime. Its tendency to produce calcareous deposits makes it very objectionable for use in steam boilers.
- HEATING SURFACE.**—The entire surface of a steam boiler, comprising the surfaces exposed to the heat on one side and the surfaces in contact with the water on the other side.
- HOGGING.**—The distortion of the furnace tubes of boilers caused by the expansion of the plates under the influence of heat.
- HONEYCOMBING.**—A form of boiler corrosion consisting of numerous blank holes or pits. It is due to the action of acids, to galvanic action, or to a lack of uniformity in the quality of the plates.
- HORIZONTAL BOILER.**—One in which the longitudinal axis of the barrel is horizontal, such as the Cornish, Galloway, and Lancashire boilers, and various forms of marine boilers.

BOILER SHOP TERMS

- INCLINATION.**—Some forms of horizontal boilers are inclined forwards about half an inch per ten feet of length so as to drain properly through the blow-off cock. Fire-bars are inclined backwards about one inch in ten inches to permit of the fuel being moved rapidly away from the dead-plate.
- INCrustation.**—Coatings of carbonate and sulphate of lime and other solids formed on the internal portions of engine boilers by deposition from the feed water.
- INJECTION.**—The process of drawing water into a steam boiler by means of an injector.
- KEELSONS.**—The wrought-iron or steel saddles which support marine boilers.
- LAMINATED PLATES.**—Wrought-iron or rolled steel plates in which the several layers are imperfectly united. They are very apt to blister when used for boiler plates.
- LEAKAGE.**—The loss of feed water due to the alternate expansion and contraction of the plates under the influence of sudden heatings and coolings, which tend to start the rivets and open the seams.
- LONGITUDINAL SEAMS.**—The plates which run lengthways of the boiler. They are always arranged to break-joint, and are never placed in-line.
- MANHOLE.**—An opening provided in the shell of the boiler through which a man may gain access to the interior for purposes of examination, cleaning, and repair. It is oval in form and is usually stayed either with a wrought-iron ring, or with a casting.
- MARINE BOILER.**—A horizontal boiler of the return tubular type. They are of many different types, and vary in their arrangement to suit different conditions.
- MUDHOLE.**—An opening in the lower part of a boiler through which the sediment deposited by the water is removed. When the boiler is being used, the mud-hole is closed by a door called the mud-lid which is inserted within the hole and pulled up against its inner face by means of a bolt. This bolt is attached to the door and passes through a bridge which spans the hole and rests against its outer face. The bolt is tightened to the bridge by means of an ordinary nut.
- MULTITUBULAR BOILER.**—A boiler composed of numerous tubes of brass or of iron, through which the hot gases pass from the fire-box to the chimney, and thus heat the water which is in contact with the outer surfaces of the tubes. The locomotive, horizontal, and portable boilers are of this type.
- OVERHEATING.**—The overheating of boiler parts are due either to incrustation, or to an insufficient supply of water. It tends to soften the plates so that they bulge or fracture under the force of internal pressures.
- OVERPRESSURE.**—The pressure developed in a steam boiler exceeding that which it is designed to sustain.
- PATCH.**—A strengthening plate of wrought-iron or steel riveted or bolted to the boiler plates which have been injured by accident, or have become weakened by corrosion.
- PITTING.**—The corrosion of boiler plates in patches. See Honeycombing.
- PLATE.**—In the manufacture of steam boilers the use of wrought-iron plates has been completely abandoned for those of steel. The steel plates are rolled in larger sizes, thus reducing the number of riveted seams, and as they possess a much greater tensile strength, they permit of the development of the higher pressures required by modern engines.
- PLATE FURNACE.**—A reverberatory furnace used by boiler-makers for heating plates preparatory to bending, flanging, and welding.
- PRESSURE.**—The working pressures in steam boilers vary with the type of the boiler, the material of the boiler plates, and the method of construction. They range from 45 to 60 pounds per square inch in those of the Cornish and Lancashire type; from 100 to 180 pounds in the marine boilers; and from 120 to 235 pounds in the portable and locomotive boilers.
- PUNCHING BEAR or BOILER BEAR.**—A portable punching machine. The punch is actuated either by a screw, or by hydraulic pressure.
- RETURN FLUES.**—The flues in horizontal boilers, which are brought from the back of the furnace to the front, and are then carried back again to the chimney.
- RETURN TUBULAR BOILER.**—A marine boiler in which the smoke tubes extend from the back of the boiler forwards to the smoke-box. By this arrangement, the products of combustion are carried first to the back of the boiler through the fire-box, and then to the front of the boiler through the tubes.
- RIBBED TUBES.**—Tubes which are rolled so as to form several deep radial ribs on their internal surfaces, and thus increase the area of the available heating surface. They were invented by M. Serve. The Purves tubes are ribbed or corrugated transversely. The use of these tubes gives from 15 to 20 per cent. better results relative to the economical consumption of fuel and the increase in steam pressure than may be obtained by the use of the ordinary tubes with smooth surfaces.
- RINGS.**—Metal rings used for uniting the shells and fire-boxes, for the jointing and caulking of seams and other similar purposes. They are either cast or welded.
- RING SEAMS.**—The circumferential joints of a boiler shell.
- SALINOMETER.**—An instrument employed for ascertaining the amount of salt in the feed-water of a marine boiler. It is either a hydrometer graduated for degrees of saltness, and by which the specific gravity of the water is measured, or a thermometer by which the boiling point of the water is determined, and the percentage of salt in solution deduced therefrom.
- SALTING.**—The deposits of salt which accumulate on the plates of a marine boiler. It is not injurious to the plates unless excessive in quantity. The density of the feed-water should not exceed ten ounces of salt per gallon.
- SATURATED STEAM.**—Steam which remains in contact with the water from which it has been generated, and therefore retains a quantity of water in suspension. Also called Dry Steam.
- SCALING.**—The process of removing the scale or deposits of carbonate of lime, etc., from the interior of boiler plates. It is effected by a process of chipping with a keen-edged hammer called a scaling-hammer.
- SECTIONAL BOILER.**—A boiler composed of a number of small independent heating tubes. The advantages of sectional boilers are the high pressures that may be developed in them, the strength of the small tubes, the prevention of explosions, the rapid transmission of heat, and the facility with which local injuries may be repaired. Their disadvantages consist in the tendency to accumulate deposits in the flues, the tendency to overheating, and the difficulty experienced in clearing them out.
- SCUM COCK.**—A cock inserted in the side of a marine boiler for discharging the dirt and scum carried to the surface of the water, and which if allowed to remain in the water would deposit and form an injurious scale. See Ballooning.
- SOOT DOOR.**—A square iron door built into the front ends of the brickwork flues of horizontal boilers, through which the accumulations of soot are removed periodically.
- STAYS.**—Rods or tubes which connect and stay the flat ends of the boiler. They are made either of copper, wrought-iron, or steel. Bar stays and tube stays, also called screwed stays, are first screwed into the ends of the shells or fire-boxes, and then secured either with nuts or by riveting. Gusset stays are riveted.
- STEAM ROOM.**—The area included between the highest water level in the boiler and the boiler crown. It is the space occupied by the steam.
- TESTING.**—The strength of steam boilers or their capacity to withstand the stresses due to internal steam pressures are usually ascertained by the application of a pressure of water produced by means of a test pump. The pressure usually applied under test is about twice the working pressure.
- THROUGH TUBES.**—The flue tubes of horizontal boilers. They pass from one end of the boiler to the other, and are attached to the end plates.
- TIE BOLTS.**—Long screw bolts employed for the purpose of staying large, flat surfaces, which are inherently weak.
- TRANSFER OF HEAT.**—The transmission of heat from the furnace of a boiler to the water in the boiler. The rate of transmission or the number of heat units transferred per hour, varies according to the amount of heating surface, and is directly proportional to the thickness of the plates. Furnace area is more efficient than tube area.
- TUBE PLATES.**—The plates into which the tubes of multitubular boilers or surface condensers are inserted and secured.
- TUBULAR BOILER.**—Various forms of locomotive, marine, portable, horizontal, vertical, and sectional boilers.
- UPTAKE.**—In a vertical boiler, it is the internal flue which leads from the furnace to the chimney. In a marine boiler, it is the return flue.
- VENT.**—The value obtained by multiplying the calorimeter of a boiler by its length.
- VERTICAL BOILER.**—A steam boiler of circular horizontal section. Vertical boilers are chiefly used in connection with small steam engines, and are not

BOILING POINT — BOIS DE BOULOGNE

nearly as economical as those of the horizontal type, as the products of combustion pass from the fire-box directly into the chimney.

WATER BRIDGE.—A form of bridge which is made of iron and is continuous with the boiler itself. It is hollow, and therefore assists the circulation of the water which passes through the interior of the boiler.

WATER TUBE BOILER.—Various forms of sectional boilers of the Yarrow, Thornycroft, Babcock and Wilcox, Belleville, and other classes.

WILLIAM MOREY, JR., C. E.,
Consulting Civil and Mechanical Engineer,
New York City.

Boiling Point, the temperature at which a liquid boils, when exposed to a definite pressure, which is understood to be the ordinary atmospheric pressure, in the absence of any specific statement to the contrary. When a liquid is freely exposed to the air, evaporation goes on constantly from its surface, the heat required being absorbed from surrounding bodies. If the liquid is warmed, the evaporation goes on at an increased rate; but as its temperature is increased by the application of heat, there comes a time when mere superficial evaporation cannot take care of all the heat supplied. Bubbles of vapor then form within the body of the liquid, and the liquid is said to have attained its "boiling point." If the supply of heat be now increased, it is found that the temperature of the liquid remains stationary; bubbles merely form more rapidly, so that the rate of loss of heat through evaporation is still maintained equal to the rate of supply. The temperature of boiling depends upon the pressure; for at an increased pressure the bubbles are formed in the interior of the liquid with greater difficulty, and therefore not until a higher temperature is attained. The variation from this cause is considerable. Thus the boiling point of water, under a pressure of one atmosphere, is 212° F., while under a pressure of two atmospheres it is about 250° F. At the reduced pressures prevailing on the tops of mountains, the boiling point of water is lower than 212° F., and advantage of this fact is taken for determining the heights of mountains by observations of the boiling point at their summits. (See **HYPSONOMETRY**.) When the liquid is not open freely to the air, but confined in a closed vessel, its temperature can be raised indefinitely by the application of heat, but the vapor in the space above it is denser, and has a greater pressure, at higher temperatures. The correspondence between pressure and temperature, under these circumstances, is very exact, although no simple law connecting the two is known. Rankine gave an empirical formula for the relation between them, of which computers of steam tables have made great use ('Miscellaneous Scientific Papers,' page 1); but the physical significance of this formula is unknown. The relation between the pressure and boiling point of a liquid is commonly exhibited by means of a table in which the temperatures of ebullition are set down opposite the corresponding pressures. (For a table of this sort for water, see **STEAM**.) The phenomena described above in connection with the free evaporation from a liquid exposed to the air are in general true, but certain qualifications must be made, under certain special conditions. Thus, it is difficult to induce water to boil when it has been freed from dissolved air; and in the entire absence of such air De Luc found that water can be heated as high as 234° F., under ordinary

atmospheric pressure, before boiling, if the experiment is performed with proper care. A liquid thus heated to a temperature in excess of the normal boiling point corresponding to the pressure to which it is subjected is said to be "superheated." When boiling does finally occur in a superheated liquid, it takes place with almost explosive suddenness, and the loss of vapor is exceedingly rapid for a moment or two, until the temperature of the liquid has been reduced by this means to the normal temperature corresponding to the pressure prevailing at the time. The temperature at which ebullition takes place is also influenced to a certain extent by the nature of the vessel in which the liquid is heated. Thus Marcet found that in a glass vessel which had been carefully washed out with sulphuric acid, and then well rinsed, pure water does not boil until a temperature of 223° F. has been attained. All results of this kind are of an indefinite character, however, since they relate to the temperature at which boiling first begins, rather than to the state in which the liquid and its vapor are in a condition of permanent thermal and mechanical equilibrium. Superheated water is in an unstable state, and, according to some authorities, not a few boiler explosions have been due to the superheating of the water present, from some cause, and the subsequent explosive liberation of steam, as the water returned to its normal condition; but this notion concerning the cause of boiler explosions has never been substantiated by experiment or otherwise, and must be regarded as a mere speculation, without any foundation in fact. A liquid has a higher boiling point, when it contains some substance in solution, than it has when pure. The effect of dissolving salt or any other electrolyte is complicated by the occurrence of dissociation (q.v.); but for dilute solutions of non-electrolytes, like sugar, the following law, first given by Raoult, holds true: If a series of dilute solutions of such substances be prepared, each solution containing, per unit weight of the solvent, an amount of solid proportional to the molecular weight of the solid, then the solutions so prepared will all boil at the same temperature. (See **SOLUTIONS**.) For marking the "boiling point" upon thermometers, it is the universal practice to expose the thermometers to the steam rising from the boiling water, rather than to immerse them in the water itself; for the temperature of the steam is independent of the presence of traces of dissolved substances in the water, and also of the action of such accidental or irregular causes as the superheating of the water. See **THERMOMETRY**.

Boilly, Louis Leopold, loo-e lă-ô-pöld bwă'ye, French painter; b. La Bassée, France; d. 1845. To his prolific brush are attributed about 5,000 paintings, chiefly historical. The period represented on his canvases ranges from the time of Louis XVI. to the end of the Restoration. Among his works are: 'Arrival of the Diligence' (1803); and 'Isabey's Atelier.'

Bois d'Arc, bwă-dărk, the osage orange (q.v.).

Bois de Boulogne, bwă-dê boo-lô-ny, once a forest abounding with game near the gates of Paris, now a beautiful park belonging to the city; area, 2,250 acres. The greater part of the old trees were destroyed during the revolution. When Napoleon chose St. Cloud for a summer

residence, he ordered young trees to be planted, had the place enclosed with a wall, and stocked with game. In 1815 the British troops under the Duke of Wellington were stationed in it, and many of the trees were then cut down, but new ones were planted by Louis XVIII. In 1852 it came into the possession of the municipality, and is now one of the gayest holiday promenades. During the Franco-German war of 1870-1 a large number of the trees were cut down by the French in preparing for the defense of Paris. In the time of the disturbances of the Commune in 1871 several sanguinary encounters took place here. In the Bois are the noted Auteuil and Longchamp race courses, and also the Jardin d'Acclimatation.

Bois-le-Duc, bwä-lê-dük (Dutch HERTOGENBOSCH), the capital of the province of North Brabant, in Holland, 49 miles southeast of Amsterdam, at the confluence of the Dommel and the Aa, which form, by their junction, the Diest. It was a strong fortress up to 1876, but has ceased to be kept as such. It is intersected by canals, and among its buildings the chief is the cathedral, in late Gothic, built in 1458-98, with an old tower of the 11th century, and a chapel of the 13th, the whole recently restored. Other buildings are the town-hall, palace of justice or court-house, the episcopal palace, and the government buildings. Among educational institutions are a gymnasium, a Latin school, and a normal school for teachers. Bois-le-Duc has many industrial establishments and an active trade. Its chief manufactures are gold and silver wares, cigars, mirrors, boots, and shoes, etc. The city suffered much in the religious wars of the 16th century, and fell into the hands of the Dutch in 1629. On 14 Sept. 1794, the French defeated the English here, and on 9 October of the same year it surrendered to Pichegru. In January 1814, it was taken by the Prussians, but the citadel held out. Pop. (1900) 44,034.

Bois-Guilbert, bwä-gel-bär, Sir Brian, a character in Scott's 'Ivanhoe.' He is a Knight Templar whose passionate attachment to the beautiful Jewess Rebecca, severe struggle with his pride and tragical death in the lists, form one of the most dramatic features of the romance.

Bois de Vincennes, bwä dé vān-sēn, the ancient hunting park of Louis IX.; now a pleasure-ground of 2,250 acres on the west of Paris. A large portion of it is devoted to the purposes of the Champ de Manœuvres, drill-ground, and polygone d'artillerie.

Boise, James Robinson, American educator: b. Blandford, Mass., 27 Jan. 1815; d. Chicago, 9 Feb. 1895. He was graduated at Brown in 1840, and received an appointment there as tutor in ancient languages. In 1850 he went abroad to study; in 1852 became professor of the Greek language and literature in the University of Michigan; in 1868 took the same chair in the University of Chicago. Upon the establishment of the new University of Chicago, he was appointed professor emeritus of New Testament Greek. The numerous classical text-books edited by him were widely used. Besides these, he published: 'Notes on the Greek Text of Paul's Epistles to the Ephesians, Colossians, Philemon, and the Philippians' (1884); 'Notes on the Greek Text of Galatians and Romans' (1886).

Boise, Otis Bardwell, American composer and music teacher: b. Oberlin, Ohio, 13 Aug. 1844. After studying music in Leipsic he settled in New York as a teacher of composition and for a time was organist of the Fifth Avenue Presbyterian Church. During 1876-7 he was again in Europe studying and had the benefit of Franz Liszt's advice and criticism, after which he resumed teaching in New York. Since 1888 he has been engaged in professional work in Berlin. He has published: 'Harmony Made Practical' (1900); 'Music and Its Masters' (1901), and many articles in journals devoted to music.

Boise, Idaho, the capital of the State and county-seat of Ada County; on the Boise River and the Union P. R.R.; 45 miles southwest of Idaho City. It occupies the site of a former trading post of the Hudson Bay Company; is in an agricultural and a rich mining region; and is supplied with pure hot water from a flowing boiling well. The city is said to be the only one in the world having a natural supply of hot water. It contains the State capitol, erected in 1885-7, penitentiary, United States assay office, State library, high and graded schools, and two national banks. Its mayor is elected biennially. Pop. (1900) 5,957.

Boisgobey, Fortuné Abraham du, fôr-tünä äb-rä-ham dü bwä-gô-bä, French novelist: b. Granville, 11 Sept. 1821; d. February 1891. In 1844-8 he was paymaster in the army at Algiers, and began to write in 1868, somewhat on the lines of Emile Gaboriau. His novels were popular, and include: 'The Scoundrels' (Paris 1873); 'Chevalier Casse-Con' (1873); 'The Mysteries of Modern Paris' (1876); 'The Demi-Monde Under the Terror' (1877); 'The Old Age of M. Lecoq' (1878); 'The Cat's Eye' (1888); and 'The Cold Hand' (1879).

Boisserée (bwä-srā) **Collection**, a number of pictures exhibited in Munich, which were collected by the brothers Sulpice (1783-1854) and Melchior Boisserée (1786-1851), and John Bertram, men who, animated by love of the arts, began, at the time of the destruction of the monasteries, during and after the French revolution, to purchase old pictures, and afterward completed their collection by the addition of many valuable paintings of the old German school. By this collection the brothers Boisserée and Bertram happily realized the idea of a historical series of old German paintings. It is to their endeavors that we owe the discovery that Germany possessed, as early as the 13th century, a school of painters of much merit, which, like the Italian, proceeded from the old Byzantine school, but became, in the sequel, distinguished by excellences of its own. We owe to these collectors, also, the restoration to favor of the forgotten Low German masters, and a just estimation of John van Eyck, as the creator of the genuine German style of painting. The most distinguished connoisseurs and artists, including Goethe, Canova, Dannecker, and Thorwaldsen, have strongly expressed their admiration of this collection. It was first brought together and exhibited at Heidelberg, and afterward removed to Stuttgart, where the king of Württemberg assigned it a suitable building. The collection remained there till 1828, when King Louis of Bavaria, having purchased it in the previous year for 120,000 thalers, removed

it to Schleissheim, and in 1836 most of the paintings were sent to Munich. A lithographic work on this collection was published in 40 parts between 1821 and 1840. See 'Sulpiz Boisserée,' a biography (1862).

Boissier, Marie Louis Gaston, mā-rē loo-e gās-tōn bwā-syā, French archaeologist and historian: b. Nîmes, 15 Aug. 1823. After studying at the Ecole Normale he was an instructor in rhetoric in his native city 1847-57; professor of Latin eloquence and literature at the Collège de France from 1861, was elected to the French Academy in 1876 and to the Academy of Inscriptions and Belles-lettres 1886. His literary style has been much praised for its clearness and beauty. His works comprise 'Le poète Attius' (1857); 'Etude sur la ire et les ouvrages de Terentius Varron' (1861); 'La religion romaine d'Auguste aux Antonins' (1883); 'La fin du paganisme' (1894); 'Cicéron et ses amis' (1892); and 'Promenades archéologiques Rome et Pompéi' (1892); the two last named being marvelously accurate and vivid reconstructions of the antique spirit and atmosphere. Other works are: 'Roman Africa,' and 'The Country of Horace and Vergil.'

Boissieu, Jean Jacques de, zhōn zhāk bwā-syē, French painter and engraver: b. Lyons, 1738; d. there in 1810. He was intended by his parents for the magistracy, but manifested such a decided inclination for drawing that he was allowed to follow it. After remaining for some time at Lyons, and painting some excellent imitations of the Flemish school, he visited Paris, where his intimacy with the most celebrated artists of the time enabled him greatly to improve his style. On his return to Lyons he devoted his attention chiefly to engraving. He afterward accompanied the Duc de Rochefoucauld to Italy, and having studied the works of the great masters with the greatest assiduity, resumed painting; but as the use of oil injured his health, he, shortly after his return to France, abandoned it finally for engraving, in which his reputation soon became European, and his works were eagerly purchased by the most wealthy and distinguished amateurs. His engravings amount to 140 plates, among which that of 'Le Charlatan,' after a picture by Karel Du-jardin, is considered his masterpiece.

Boissonade, Jean François, zhōn frān-swa bwā-sō-nād, French classical scholar: b. Paris, 12 Aug. 1774; d. Passy, 8 Sept. 1857. He was educated at the Collège d'Harcourt, and at the age of 18 was attached to the ministry of foreign affairs. He subsequently became a contributor to periodical literature in the 'Magasin Encyclopédique' of Millin and the 'Journal de l'Empire,' the precursor of the 'Journal des Débats.' Ancient and modern literature, both French and foreign, grammatical criticism, bibliography, and natural sciences occupied his pen. In 1813 he was admitted a member of the Academy of Inscriptions and Belles-Lettres. He afterward wrote about 150 articles for the 'Biographie Universelle.' He became, in 1809, assistant of Larcher, as Greek professor of the faculty of letters in Paris, and four years afterward he succeeded him both in the faculty and in the institute. Finally, in 1828, he was called to the chair of Greek literature in the College of France. From this time he devoted himself entirely to his duties as a professor, and his

labors as a classical editor. He has produced no complete work in French, but is said to have written Latin with natural grace and elegance, and his editions of the classics are highly esteemed. His editorial labors were also extended to a few French works, and he translated a heroï-comic poem, the "Genpillen," from the Portuguese.

Boissy d'Anglas, François Antoine, frān-swā ān-twān bwā-se dān-glas (COMTE DE), French statesman of the revolutionary period: b. Saint Jean-la-Chambre, near Annonay, 1756; d. Paris, 20 Oct. 1826. He studied at Annonay, and was admitted as an advocate to the parliament of Paris. In 1789 he was elected to the States-General where he was a moderate advocate of revolutionary principles, in support of which he wrote at this time various brochures. In 1792 he was returned as a deputy to the convention. He voted against the death of Louis XVI., and after the fall of Robespierre he was appointed secretary of the convention, and a member of the Committee of Public Safety. He was created a peer by Louis XVIII. in 1814, but supported Napoleon during the Hundred Days, and was consequently expelled from the peerage by a royal ordinance, but shortly afterward reinstated. He was from 1803 a member of the consistory of the Reformed Church, a member of the Institute from its commencement, and on its reconstruction in 1816 he became a member of the Academy of Inscriptions. He wrote an essay on the life and writings of Malesherbes (1819-21); 'Etudes Littéraires et Poétiques d'un Vieillard' (1825).

The fame of Boissy d'Anglas rests chiefly on a scene in the convention in 1795, when the hall was invaded by an angry mob demanding bread and the Constitution of 1793. Called temporarily to take the chair, in the absence of the president, Boissy had presented to him the head of a deputy, Féraud, which had been cut off by the insurgents and placed on the end of a pike. He saluted it, and continued calmly facing the mob, and to his courage and firmness the safety of the convention at this crisis is attributed. Such is the popular version of a story of which the most various and contradictory accounts are given. It has been said that Boissy d'Anglas exhibited no such courage as has been attributed to him, and that he was merely kept in his place by the pressure of the mob. His enemies, who accused him of reactionary tendencies, even said the insurrection was started by the reactionary party to discredit the revolution, and that Boissy was in understanding with the leaders of the mob. For this last accusation there appears to be no foundation, but it is quite likely the scene may have been represented in a more dramatic form than as it actually occurred.

Boito, Arrigo, ā-rē'gō bō-ē'tō, Italian composer: b. Padua, 24 Feb. 1842. His great work, the opera 'Mefistofele,' occupied him for nearly 20 years. The garden scene was written while he was a student in the Milan Conservatory in 1856, and the score was finished for the stage in 1868, the composer having done much literary work in the interim and lived variously in France, Germany, and Poland. On 5 March 1868, 'Mefistofele' was sung at La Scala, Milan, the performance lasting six hours, much interrupted by hissing and applause, and its failure was evident. Boito then remodeled the opera,

and in 1875 it was produced at Bologna with great success. It was sung in other cities with equal success, but it has never been a popular opera in the full sense of the word. In 1883 it was produced at the New York Metropolitan Opera House with Campanini and Nilsson in the cast and was revived in 1896 and again in 1901. The opera is considered one of the most important of modern Italian operas, marking, as it does, the precise point where the modern school of Italian composition, illustrated by the later works of Verdi, Mascagni, Puccini, etc., diverges from the work of the Bellini and Donizetti school. Boito's other operas, 'Ero e Leandro'; 'Nerone'; and 'Orestide' have never been sung.

Boivin, Marie Anne Victoire, mā-re ān vīc-twā bwā-vān (GILLAIN), French midwife, upon whom a diploma of M.D. was conferred by the University of Marburg, noted for her writings on obstetrics: b. Montreuil, 9 April 1773; d. 16 May 1841. She was educated in a nunnery, where by her talents she attracted the attention of the sister of Louis XVI., Madame Elisabeth. When the nunnery where she was placed was destroyed in the course of the revolution, she spent three years in the study of anatomy and midwifery. In 1797 she married an employee at Versailles, of the name of Boivin, but on being left after a short time a widow with a child and without fortune, undertook the office of midwife at the Hospital of the Maternity, and, in 1801, was appointed chief superintendent of the institution, to which, in accordance with her suggestion, a special school of accouchement was added by Chaptal. Her 'Mémorial de l'art des accouchements,' published in 1824, passed through several editions. The empress of Russia invited her to St. Petersburg, but she declined.

Bojaca, bō-zhā'ka, Battle of, so called from having been fought near the bridge of the small town of Bojaca, not far from the city of Tunja, between the Spaniards under Barreyro, and the united forces of Venezuela and New Granada, commanded by Bolivar. It occurred 7 Aug. 1819, and was decisive of the independence of New Granada. Among the Republicans, Gens. Anzuategui, Paez, and Santander distinguished themselves; and the Spaniards sustained a total defeat, their general, most of their officers and men who survived the battle, together with all their arms, ammunition, and equipments, falling into the hands of Bolivar. So complete was the destruction of the Spanish army, that the viceroy instantly fled from Santa Fé, leaving even the public treasure a prey to the conquerors.

Bojador, bō-zhā-dōr', Cape, a promontory on the west coast of Africa; lat. 26° 7' 10" N.; lon. 14° 29' W. It is one of the projecting points of the great desert of Sahara, and forms the west extremity of a rocky ridge called the Jebel-khal or Black Mountain. The coast north of this cape is extremely dangerous, being shallow to a great distance out, and constantly enveloped in a haze. It has been, in consequence, the scene of many a melancholy disaster. Cape Bojador was long the limit of navigation toward the south and was first passed by the Portuguese in 1433.

Bojol', Philippines, an island north of Mindanao, about 40 miles long by 30 miles wide. It is woody and mountainous. Rice and gold are its chief productions. Pop. 187,000.

Bok, Edward William, American editor: b. Helder, Holland, 9 Oct. 1863. He came to the United States in infancy, and was educated in the public schools of Brooklyn. He has edited the 'Ladies' Home Journal,' and written 'The Young Man in Business,' and 'Successward.'

Boker, George Henry, American poet and dramatist: b. Philadelphia, Pa., 6 Oct. 1823; d. there, 2 Jan. 1890. He graduated from Princeton in 1842; studied law; and was United States minister to Turkey in 1871-5, and to Russia in 1875-9. His plays include: 'Calaynos' (1848); 'Anne Boleyn' (1850); 'Francesca da Rimini'; 'The Betrothed'; and 'All the World's a Mask.' He published also 'Poems of the War' (1864); 'Königsmark and other Poems' (1869); 'The Book of the Dead' (1882); and 'Sonnets' (1886); 'Francesca' is his best play and has been several times put upon the stage by Barrett and other actors.

Bokelmann, Christian Ludwig, krīst-yān lood-vīg bō'kēl-mān, German painter: b. Saint Jürgen, 1844; d. 1894. He was a pupil of Wilhelm Sohn at Düsseldorf and became distinguished as a genre and portrait painter. Among his works are: 'House of Sorrow'; 'Pawnbroker's Shop'; 'Opening of the Will'; 'Portrait of Klaus Groths.'

Bokhara, bō-kā'ra, a khanate of Central Asia, practically vassal to Russia, bounded on the north by Russian Turkestan, west by Khiva and the Russian Trans-Caspian territory, south by Afghanistan, and east by Russian Turkestan. It formerly occupied considerably more territory than now, having been reduced by the conquests and encroachments of Russia, which have been only partially compensated by some additions. The present area of the khanate is estimated at about 92,000 square miles. The country is to a great extent occupied by deserts and low and naked ranges of mountains, and the cultivated portions of it are confined to the valley of the rivers, especially the Oxus or Amoo Daria, which forms the southern boundary for a considerable distance, and then flows from southeast to northwest parallel to and not far from the frontier of the country. Bokhara lies between lat. 37° and 41° N., and in greater part is no more than 1,100 or 1,200 feet above the level of the sea, but in the extreme east is mountainous. The climate is subject to great extremes, being warm in summer and very cold in winter. There is very little rain, on which account it is necessary to resort to artificial irrigation. Besides cereals, cotton, tobacco, and vegetables are cultivated, and there is abundance of fruit. The total population amounts to about 2,250,000, and consists of the Uzbecks, who are the ruling race, and to whom the emir belongs; the Tajiks, who form the majority in the capital; the Kirghizes, less numerous than the Tajiks; about 60,000 Arabians, descendants of the soldiers who were brought into the country by the third caliph of Bagdad on the occasion of the conquest of Turkestan; Persians who have chiefly been brought as slaves to Bokhara; Turcomans, Hindus, and about 10,000 Jews who live in the towns beyond the protection of the law, and accordingly oppressed by the other inhabitants. Since the

BOKHARA

separation of Samarcand there are now only two towns of importance in Bokhara, namely, the chief town Bokhara, with a population of about 60,000; and Karshi, with about 25,000. Besides these there are a few small towns and some hundred villages in the country. The capital, according to Vámbéry, the centre of Tartar civilization, is ill built and has a gloomy aspect, and in luxury of dress and mode of life is far behind the towns of western Asia. Among the people there reigns the utmost moral corruption along with a rigorous adherence to outward forms. The country is distinguished from the other countries of Central Asia by its numerous schools, and in the same proportion by the amount of culture diffused among the people generally; but the women are even more degraded than in other Mohammedan countries. The rule of the emir is absolute, though he is to some extent under the influence of the clergy. The manufactures are unimportant, but there is a very considerable caravan trade, cotton, rice, silk, and indigo being exported, and woven goods, sugar, iron, etc., being imported. There is also now a trade by railway, since the making of the line from the Caspian to Samarcand. Bokhara is remarkable for its religious fanaticism, and various European travelers have been exposed to danger. After Alexander Burnes had visited Bokhara on a commission from the government of India in 1832, the British ambassador in Teheran sent Col. Stoddart in 1838 to obtain from the Emir Nasrulla the deliverance of the Russian prisoners that he had taken on his predatory incursions into Russian territory. Nasrulla, however, irritated at the neglect to answer his letter to the queen of England, ordered Col. Stoddart to be thrown into prison, and after treating him with great cruelty, compelled him to acknowledge the Mohammedan creed. Capt. Conolly, who had been with a similar object in Khiva and Khokand, came in 1841 to Bokhara, and after having to submit to the same treatment as Col. Stoddart, was executed along with him in 1842. Information of their fate was brought to Europe by the missionary Wolff, who had been sent to Bokhara in 1843 for this purpose.

In 1850 the Russians established themselves at the mouth of the Sir (Jaxartes), where it flows into the Sea of Aral, and in 1864 they found it necessary to proceed farther up the river. They made themselves masters of the two towns Turkestan and Aulie-ata, and after bringing them into communication with one another, invested Chemkend, Niazbek, and Chinab. The land thus occupied, which up to that time had formed the northern half of the khanate of Khokand, was, along with some other districts that had previously been annexed to Russia, erected into the Russian government of Turkestan, and incorporated with the general government of Orenburg, by the ukase of 14 Feb. (26) 1865. By a subsequent ukase, dated 11 July (23) 1867, this territory was constituted a general government. Soon after the khan of Khokand invaded the Russian territory, in consequence of which the Russians advanced still farther south and attacked Tashkend, which they took on 28 June 1865. They did not, however, incorporate Tashkend with the Russian territory, but declared it an independent khanate under the protection of Russia. This arrangement was opposed by Muzaffer-

Eddin, Emir of Bokhara, whereupon the Russian general Romanovski again assumed the offensive, and marching into Bokhara took Khojend by storm on 5 June 1866. In this way Russia came into the possession of the whole basin of the Sir. Not long after Tashkend was incorporated with the Russian territory by the desire of the inhabitants. Meanwhile the war with Bokhara still went on, and peace was not concluded till the beginning of 1867. This peace, however, did not last long. The war was renewed in the spring of the following year, and it was only in July 1868 that the terms of peace between Russia and Bokhara were finally agreed upon. Bokhara was to give up Samarcand and Katti Kurghan, along with the surrounding districts (constituting the tract of land watered by the Zerafshan), and at the same time promised to pay an indemnity to Russia and to protect her trade. Since then the peace has not been broken, but the Emir of Bokhara has sunk more and more into a position of entire dependency on Russia. During the autumn the Russians intervened against the emir's son, who had risen in revolt against him, and on 12 October in the following year the emir sent an embassy with presents (tribute) to the czar at St. Petersburg. In the meantime Muzaffer-Eddin had fallen into a dispute with Afghanistan. Shere Ali Khan, of Kabul, had given a favorable reception to the rebellious son of the emir, and Muzaffer-Eddin, probably in consequence of encouragement from Russia, now thought himself able to make good his former claim to Badakshan, and the territory lying about the sources of the Oxus, especially since the Khan of Kabul seemed to have but a slight hold of these parts. He had accordingly already sent out an army with the view of conquering those parts, when, toward the end of 1869, pressure being put upon him by Russia, he concluded a treaty with Kabul by which the Oxus was fixed as the boundary of the conterminous states, and this boundary was afterward recognized by Russia and England. After the Russian expedition to Khiva in 1873 an agreement was made between Russia and Bokhara on 28 September of that year, according to which Bokhara received a portion of the territory that had been ceded by Khiva to Russia, while the Russians received various privileges in return. Muzaffer-Eddin died in 1885, and was succeeded by his son Abd-ul-Ahad. Bokhara will probably be ultimately completely placed under Russian administration, for what little power it had lapsed in 1884 by the practical absorption of the country, resulting from the annexation of Merv. Since 1885 the troops, which were formerly ill trained and badly armed, have been drilled by Russian instructors and armed with rifles. See Le Messurier, 'From London to Bokhara' (1899); O'Donovan, 'The Merv Oasis' (1880); Curzon, 'Russia in Central Asia' (1889).

Bokhara, the capital of the khanate of the same name, in lat. 39° 48' N.; lon. 64° 26' E. It is eight or nine miles in circuit, and is surrounded by a mud-wall. It is poorly built, consisting of extremely narrow streets and paltry houses. The principal edifices are the palace of the khan, crowning a height near the centre of the town and surrounded by a brick wall 70 feet high; and numerous mosques, the largest of which is enameled

with tiles of azure blue, and has a tower 210 feet high. The trade was formerly large with India, but has now been almost completely absorbed by Russia. There are several manufacturing establishments producing blades, various metal articles, silks, and cloth. The pop. (estimated) 60,000.

Bol, *böl*, **Ferdinand**, Dutch painter: b. Dordrecht, 1610; d. Amsterdam, 1681. He was the pupil of Rembrandt, and is best known by his admirable portraits, in the style of that master, though he likewise executed several historical paintings of merit. Many of his works are still to be seen at Amsterdam. He also practised etching with success. His best known portrait is that of Saskia, the wife of Rembrandt, now in the Brussels Museum.

Bolan (*bō-lān'*) **Pass**, a celebrated defile in the Hala Mountains, leading from Sind into Beluchistan. It is about 60 miles long, hemmed in on all sides by lofty precipices, and in parts so narrow that a regiment could defend it against an army. It is traversed by the Bolan River. The crest of the pass is 5,800 feet high. The English government has recently built a railway through the pass to connect Sind with Kandahar.

Bolas (that is, "balls"), a form of missile used by the Paraguay Indians, the Patagonians, and especially by the Gauchos of Argentine. It consists of a rope or line having at either end a stone, ball of metal, or lump of hardened clay. When used it is swung round the head by one end, and then hurled at an animal so as to entangle it.

Bolbec, *böl-bēk*, a town in France, department of Seine-Inferieure, 17 miles east-northeast of Havre; agreeably situated on the side of a hill, washed by the Bolbec, which supplies waterpower for its mills, and at the junction of four valleys. It is a thriving and industrious place, and well situated for commerce. Its printed cottons and handkerchiefs have long been held in high estimation. Besides these it produces linen and woolen stuffs, lace, cotton, velvet, and thread, and has several dyeworks and tanneries, with a considerable trade in grain, horses, and cattle. Pop. (1896) 12,239.

Boldini (*böl-de'ne*) **Giovanni**, Italian artist: b. Ferrara, 1845. He studied for some time in London, and many of his paintings are found in American collections. His portraits have been especially commended. Among his works are 'Gossips'; 'The Connoisseur'; 'Kitchen Garden'; and 'Portrait of Menzel.'

Boldrewood, **Rolf**. See BROWNE, THOMAS ALEXANDER.

Bole, a term applied to various clay-like substances. They are chiefly hydrous silicates of aluminum and iron. It is of a dull yellow, brownish, or red color, feels greasy to the touch, and yields to the nail. It has a conchoidal fracture; its streak is shining, and it is opaque or slightly translucent. Bole is found in various localities, such as Armenia, Saxony, Tuscany, and the isle of Skye in Scotland. In ancient times, under the name of Lemnian bole or earth, it had a place in the *ateria medica*, but is no longer used. At present

the only bole of commerce is a coarse pigment sold under the name of Berlin and English red.

Bolero, *bō-lā'rō*, the name given by the Spaniards to a number of their national dances of the ballet class, which in Spain are regularly performed in theatres between the different pieces. They are danced both by men and women, the male dancers who take part in these performances being also called boleros, while the females are called boleras. The dances of this class which are best known and most in vogue are known by such names as the Cachuca, Iota aragonesa, Madrileña, Ole, Ialeo de Jerez, etc. They are danced by one or more couples, or, as in the case of the indecent Ole, by a single female dancer. The dancers wear the Andalusian costume, partly because of all the national dresses of Spain this is the richest and most elegant, and partly because the greater number of the boleros are of Andalusian origin. The music for these dances is always played by the orchestra, and is generally marked by rapid changes of time. The melodies are often very beautiful, and are always based upon some of the national airs. The dancers mostly beat time to the music with the castanets (*castañuelas*). These dances, when the performers are well trained and handsome, have a very powerful effect on the spectators, consisting as they do of graceful attitudes and movements of the body, and being strictly speaking not dances, but pantomimes. The dancers endeavor to express by their gestures all the different phases of the passion of love, and this often in a manner which passes far beyond the bounds of modesty. The dances of the common people, on which the boleros are founded, are essentially distinguished from the latter by the fact that the former are accompanied by singing,—partly that of the performers, partly that of the spectators,—while the music is mostly supplied by the guitar, or in some cases by the tambourine. They are very simple, but at the same time very graceful. The dancers beat time with the castanets, as in the boleros properly so called.

Boleslas, the name of six kings of Poland and three of Bohemia. The most celebrated of them, Boleslas, surnamed the Great, and the first Polish sovereign who had the title of king, was son of Duke Mietchislaw, and succeeded him in 999. He completed the work of introducing Christianity which his father had begun, contributed greatly to the progress of civilization, and brought the army under regular discipline. The Emperor Otho III. resolved to ascertain his real character by visiting him in person, and was so much pleased with the deference with which he was received, that he crowned him with his own hands in 1001, and exempted him from all homage and tribute. Boleslas assumed all the splendor of his new dignity, and became a powerful sovereign. He not only repelled an aggression on his territories by the Duke of Bohemia, but became in his turn the aggressor, and conquered Moravia. Success awakened a desire for new conquests, and the Russians, who hitherto had always been the aggressors, were attacked in their turn, and were obliged to purchase peace by the cession of large tracts of territory. He afterward turned his arms to the north of Germany, and compelled the greater part of the northern sovereigns to

become his tributaries. In 1012 a formidable league was formed against him by the emperor of Germany and the dukes of Bohemia and Austria; but the allies were glad to conclude a peace with him in 1018. His last campaign was against the Russians, whom he signally defeated in a great battle on the banks of the Bug. After 20 years of continued warfare he was permitted to enjoy peace, and effected numerous internal improvements, promulgating excellent laws, and even putting a check upon his own power by the appointment of a council of 12 to act as mediators between the sovereign and the people. This body was the germ of the Polish senate. Boleslas died in 1025, after a reign of 26 years, which is one of the most glorious in the annals of Poland, and has handed down his name as one of the greatest sovereigns of his time.

Boletus, a genus of fungi of the order *Hymenomycetes* (fungi provided with a cap and a fructiferous membrane or hymenium which covers the sporules contained in the tubes). The greater number of the species are globulous, from which the Italians called them *ovoli*. The characters of the genus are, broad, hemispherical cap, the lower surface formed of open tubes, cylindrical in form, and adhering to one another. The tubes can be separated from the cap, and contain little cylindrical capsules, which are the organs of reproduction. They differ from the *Polyporci* by the absence of the membrane which encloses the tubes. *Boletus edulis* has the pedicle thick, especially at the base, and marked with red and pale white. The cap is also thick, smooth, and fawn-colored. The tubes are very small, rounded, and pass from white to a greenish yellow. It grows on the ground abundantly in woods during summer. The flesh is firm, and has an agreeable nutty flavor. It is a considerable article of commerce in France, particularly around Bordeaux. It is also found in England, but more rarely. The other species of *Boletus* are numerous.

Boleyn, bül'ēn, **Anne**, queen of England, one of the wives of Henry VIII.: b. probably in 1500; d. 26 May 1536. The name is also spelled Bullen and Bouleyne. Her father, Sir Thomas Boleyn, had been several times sent by Henry as ambassador to France, and her mother was a daughter of the Duke of Norfolk. At the age of 15 years Anne accompanied to France as maid of honor the Princess Mary of England, betrothed to Louis XII.: but when that princess three years later returned to England a widow, Anne did not follow her, but remained at the French court, the freedom and gaiety of which suited her natural disposition, and where she was admired for her beauty and wit. She was attached to the household of Claudia, wife of Francis I., after whose death she was for a time in the service of the Duchess of Alençon, sister of Francis I. Young, beautiful, gay, and witty, she was an object of great attraction in the gallant court of Francis I. She returned to England about 1522, and became lady of honor to Queen Catharine, whom she soon supplanted. The king, passionately enamored of her, found an unexpected opposition to his wishes, and Anne firmly declared that she could be had on no terms but those of marriage. She knew that the king already meditated a divorce from his wife, Catharine of

Aragon; but she also knew what difficulties the Catholic religion opposed to the execution of this plan. Cranmer offered his services to bring about the accomplishment of the king's wishes, and thus gave the first occasion to the separation of England from the Roman Church. But the impetuous Henry did not wait for the ministers of his new religion to confirm his divorce; on the contrary, he married Anne in January 1533, having previously created her Marchioness of Pembroke. When her pregnancy revealed the secret, Cranmer declared the first marriage void, and the second valid, and Anne was crowned queen at Westminster with unparalleled splendor. In 1533 she became the mother of the famous Elizabeth. She could not, however, retain the affections of the king, as inconstant as he was tyrannical; and as she had supplanted her queen while lady of honor to Catharine, she was now supplanted herself by Jane Seymour, her own lady of honor. Suspicions of infidelity were alleged, which appear to have had no foundation in truth, but were doubtless eagerly laid hold of by Henry as a color for his violent proceedings. In 1535 she was accused, and brought before a jury of peers. Smeaton, a musician, who was arrested with others, asserted that he had enjoyed the queen's favors, and 17 May 1536 she was condemned to death by 26 judges. Anne in vain affirmed that she had long before been contracted to the Duke of Northumberland, and therefore had never been the lawful wife of Henry. Cranmer in vain declared the marriage void. The sentence of death was executed by the command of the inflexible Henry, who esteemed it a great exercise of clemency to substitute the scaffold for the stake. The last day of the life of this unhappy woman, 19 May 1536, presents many interesting moments. She sent for the wife of the lieutenant of the Tower, threw herself upon her knees before her and said, "Go to the Princess Mary (daughter of Catharine) in my name, and in this position beg her forgiveness for all the sufferings I have drawn upon her and her mother." "She sent her last message to the king," says Hume, "and acknowledged the obligations which she owed him in uniformly continuing his endeavors for her advancement." "From a private gentlewoman you have made me first a marchioness, then a queen, and as you can raise me no higher in this world, you are now sending me to be a saint in heaven."

See Strickland, 'Queens of England' (Vol. II., 1875-80); Dixon, 'Two Queens' (1873-4); Friedmann, 'Anne Boleyn' (1885).

Bolgrad, Russia, a town on the river Yalpoohk, in the Lower Budjak, colonial district of Bessarabia, 162 miles from Odessa and 30 miles from Ismail. It is celebrated for the frequent mention made of it in the discussions relative to the territorial difficulties of Russia with Turkey in the Treaty of Paris of 1856. Pop. (1897) about 13,000.

Bolingbroke, Henry St. John (VISCOUNT), English statesman, wit, and man of letters: b. Battersea, London, 1 Oct. 1678; d. 12 Dec. 1751. His early education was managed by his mother on strict puritanical principles, against the rigidity of which he appears soon to have rebelled. After attending school at Eton he proceeded to Christ Church College, Oxford, where he soon distinguished himself by the brilliancy of his

BOLIVAR

parts rather than by his diligence and application. On leaving the university he is supposed to have spent some years in travel upon the Continent, although he has left no record of this period. He attracted attention by his elegance of manners, with beauty of person, dignity, and affability, and such fascinating eloquence that, according to the unanimous testimony of his contemporaries, nobody could resist him. Unfortunately the passions of his youth opposed the development of his talents; and in his 23d year he was distinguished principally as an accomplished libertine. He married a wealthy heiress, the daughter of Sir Henry Winchcomb, a lady of cultivated mind and noble birth. But the young couple had lived but a short time together when irreconcilable disputes arose between them, in consequence of which they separated forever. By the influence of his father he obtained a seat in the House of Commons. Here his eloquence, his acuteness, and the strength of his judgment attracted universal attention. His former idleness was changed at once into the most incessant activity. In 1704 he was made secretary of war, and came into immediate connection with the Duke of Marlborough, whose talents he discerned and whose enterprises he supported with all his influence. When, however, the Whigs gained the ascendancy in 1708, Bolingbroke gave in his resignation. Now followed the two most active years of his life, in which he devoted himself to study, but by no means neglected public affairs. He continued to maintain a constant intercourse with the queen, who preferred him to her other counselors. The Whig ministry was overthrown, to the astonishment of all Europe, in 1710, and Bolingbroke assumed the department of foreign affairs. In 1712 he was called to the House of Lords by the title of Viscount Bolingbroke, and in 1713, against much popular opposition, he concluded the Peace of Utrecht, of which he was always proud. In concluding this peace everything was unfavorable to him—the Whigs, the peers, the Bank, the East India Company, Marlborough, Eugene, the emperor, Holland, the jealousy of all the European powers, the weakness of his own queen, the irresolution, imprudence, and even the envy of his colleagues. Bolingbroke afterward became a prey to the impetuosity of his passions, and exhibited a fickleness of conduct that has rendered his loyalty, his patriotism, and his whole character suspected. The collision of the Whigs and Tories produced such a general excitement that the ministers were attacked, the Peace was decried as disastrous, and the Protestant succession was declared in danger. At this moment a fatal contention broke out between the lord-high-treasurer (the Earl of Oxford) and Bolingbroke, immediately after the conclusion of the Peace. Swift, the friend of both, but particularly intimate with the lord-high-treasurer, accused Bolingbroke of having principally contributed to the ruin of their party. Be this as it may, Queen Anne, provoked to the utmost by Oxford, dismissed him four days before her death, and made Bolingbroke prime minister. But the death of Anne changed the whole scene. George I. of Hanover ascended the throne, and the Whigs triumphed more completely than ever. Bolingbroke, who could not impose on the Hanoverian court by his plausible pretenses, and who was as much envied as he was hated,

was dismissed by King George while yet in Germany, and fled to France in March 1715. In August of the same year he was attainted. James III., the Pretender, as he was called, invited him to Lorraine and made him his secretary of state. But when Louis XIV. died Bolingbroke lost all hope of the success of the Pretender, and repented of having entered into so close a connection with him. Whatever the feelings and plans of Bolingbroke may have been, his intentions with regard to James III. were doubtless honest. Nevertheless the latter deprived him of his dignity and transferred it to the Duke of Ormond. Thus it was the strange fate of Bolingbroke to be charged with treachery both by the king and the Pretender. Offers were made to him by King George, on condition of his revealing the secrets of the Pretender. This proposal he at first declined, but he afterward yielded so far as to promise a decisive blow against the cause of the Pretender on condition of the total oblivion of what had already passed, and of an entire confidence for the future. Walpole, however, was afraid of Bolingbroke's influence in Parliament, and opposed his recall. Bolingbroke in order to forget his situation, applied himself to writing philosophical consolations after the manner of Seneca, but soon found sweeter ones in his marriage with a rich and amiable lady, niece of Madame de Maintenon. In 1723 the Parliament which had been so hostile to Bolingbroke was at length dissolved, and he was permitted to return to England. His estates, however, were not restored until two years after by a particular act of Parliament. On his return he lived at first retired in the country, maintaining, however, a correspondence with Swift and Pope. But no sooner was the voice of opposition heard in Parliament than he hastened to London, and, as the restoration of his seat in the House of Lords was still denied him, attacked the ministry during eight years in the journals or in pamphlets with great success. He made for himself powerful enemies, against whom he directed his 'Treatise on Parties,' which is considered his masterpiece. He then returned to France with the intention, as even Swift supposed, of throwing himself into the arms of the Pretender's party, against which charge Pope defended him, and declared that he had himself advised his noble friend to leave an ungrateful country, by which he was suspected and persecuted. In France, Bolingbroke wrote (1735) his 'Letters on the Study and Use of History,' which are admired even at the present day, but in which the individual character of the author appears to the exclusion of general views, and which were blamed, in particular, for attacking revealed religion, which he had once warmly defended. In 1729 in the midst of his contest with Walpole, he had suggested to Pope his 'Essay on Man,' and supplied him with the most important materials. He wrote (1738) his 'Idea of a Patriot King' under the eyes of the heir-apparent. From 1746 he lived in Battersea, where he died.

Bolívar, Simon, sē-mōn' bō-lē'vār, South American liberator: b. Caracas, 24 July 1783; d. San Pedro Alejandrino, near Santa Marta, 10 Dec. 1830. He was a descendant of a prominent and wealthy Venezuelan family, studied in Spain, visited Paris, and, when but 18 years old, married in Madrid. His wife died

BOLIVAR—BOLIVIA

soon afterward. The sources of the inspiration of his life's work were: (1) The spectacle of the French Revolution; (2) the example of the United States, which country he visited in 1809; (3) the personality of Gen. Miranda, the leader of the revolutionary movement in Venezuela, who had openly and vigorously attacked Spain's colonial government. Bolívar offered his services to the revolutionary junta a year before Venezuela declared its independence, which was on 5 July 1811.

The revolutionists being at first overwhelmed by the Spanish forces, Bolívar fled to Curaçao. In September 1812 he was at Cartagena; next, we see him scoring against the Spaniards in New Granada; then marching back into Venezuela with only 500 men, but winning so many recruits among the inhabitants that he could meet and defeat Gen. Monteverde at Lastoguanes. He entered Caracas in triumph, 4 Aug. 1813, but suffered defeat in July 1814, and Caracas was again a Spanish town. He then went back to New Granada, succeeding at Bogotá; failing at Santa Marta; resigning his commission, and sailing for Kingston, Jamaica, in May 1814. Next, from Aux Cayes, Haiti, he set out with a little force that President Petion equipped; but this expedition, landing in Venezuela in May 1816 was a failure. Again reinforced at Aux Cayes, he landed (December 1816) in Margarita, and (16 Feb. 1817) at Barcelona, for a three days' battle with Gen. Morillo. The latter was defeated. Bolívar was made commander-in-chief, with headquarters at Angostura. Offering to resign his command to a migratory Congress (15 Feb. 1819), he was urged to continue the war; reorganized the army; crossed the Cordilleras; joined forces with Santander, republican leader in New Granada; caught the Spaniards unawares; entered Tunja July 1819, and on 7 August won the battle of Boyacá. On 17 Dec. 1819 Venezuela and New Granada were merged in the new Republic of Colombia, which included both and absorbed Ecuador after the victory in Bomboná—the union continuing until the close of 1830. Spain made another effort, sending Gen. Torre to take command of her forces; but Torre was defeated on the field of Carabobo, in the central part of Venezuela, 25 June 1821. The constitution of Colombia was adopted, 30 Aug. 1821, and its government inaugurated with Bolívar as president and Gen. Francisco de Paula Santander as vice-president.

But in that great region lying south of Colombia and north of Chile and Argentina Spain was still strong. At the request of the Congress of Peru, Bolívar sent reinforcements under the command of Gen. Antonio José de Sucre, and went in person to the scene of action. Quito was occupied in June 1822; next, the Liberator assumed the presidency at Lima; on 6 Aug. 1824 he triumphed at Junin. Before the end of that year Sucre gave the *coup de grace* to Spain's colonial system on the mainland (though at widely separated points hopeless resistance was offered a little longer), by capturing Viceroy Laserna, General-in-Chief Aymeric, and other Spanish commanders and officers (see AYACUCHO). In June 1825 Bolívar visited Upper Peru, a region of vast extent, which, in his honor, received the name Bolivia (q.v.) when it was organized as a separate

republic. In December 1826, returning to Venezuela (where Gen. José Antonio Páez and Admiral José Padilla had destroyed the remnants of Spanish power on the northern coast), he was re-elected to the presidency, though manifesting great reluctance to retain an office the powers of which were wholly inadequate to the task of holding together in a permanent union three states such as Venezuela, New Granada, and Ecuador. Then two important steps were taken: (1) Leaders of the people assured him that he alone could avert disaster and disruption; (2) he himself assumed and attempted to exercise such powers as, in his opinion, were necessary to control the situation. At the height of his fame and strength (for he was in his 47th year), on the eve, however, of a great failure,—for the tendency to disunion in the country freed and consolidated by him had grown beyond control,—Bolívar resigned his command and died.

MARRION WILCOX,
Authority on Latin-America.

Bolívar, Colombia, a northern department of that republic, bordering the Caribbean Sea; area 21,345 square miles. The surface of the country is low and heavily wooded, agriculture having made but little progress. The most important rivers are the Magdalena, the Cauca (a tributary of the former), and the Sinu. Capital, Cartagena. Pop. about 300,000.

Bolivia, bō-lē'v'ya, an inland republic of South America, bounded on the north and east by Brazil, northwest by Peru, southwest by Chile, south by Argentina and Paraguay. It extends from north to south between lat. 10° 20' S. (see ACRE RIVER) and 22° 50' S. and from east to west between lon. 57° 47' 40" W. (Compare treaty with Brazil 17 Nov. 1903) and about 72° W. Area, exclusive of Acre and Chaco claims, estimated at 560,000 square miles.

The principal centres of population are now, and apparently have always been, located in the mountainous region of the western half of the country, called the Sierra. The eastern districts, stretching away from the slopes of the Cordillera far into the torrid interior of the continent, where are the sources of the Amazon's great tributary, the Madeira River, as well as of the Paraguay, a part of the system of the Rio de la Plata, are covered with tropical forests, are but sparsely settled. Running south-east through the departments of La Paz, Cochabamba, and Potosi is the principal range of the Andes Mountains, called the Cordillera Real. Here are the rich mineral districts of Bolivia: the Cerro Rico de Potosi alone has produced up to the present time about \$2,000,000,000 worth of silver. Here are some of the highest mountains of America and one of the greatest continuous snow-ranges in the world, having an average altitude of 20,000 feet, with the superb peaks of Illimani, Huaina-Potosi, and Illampu lifted 5,000 or 6,000 feet still higher above their gigantic associates. The western range of the Andes continues in a line parallel with the Pacific coast, rejoining the Cordillera Real near Bolivia's southern boundary. Between these two ranges are the high plains, 12,000 to 13,000 feet, and Lake Titicaca, 12,488 feet, above the sea-level. This great sheet of water, 120 miles long, and from 30 to 50 miles wide, has an average depth of 100 fathoms. Lying southeast

BOLIVIA

of Lake Titicaca are the two most famous cities of the republic, La Paz and Sucre. A railway from Mollendo on the Peruvian coast climbs up to the plateau, but where it passes over the western range of the Andes the track is 14,765 feet above the sea. On the Pacific side, then, the problem of transportation is very difficult; moreover, as is shown below, the republic has been deprived of the little strip of seacoast that was formerly in its possession.

Turning now toward the east, we find some of the best farming lands in the world, but here also the means of transportation are inadequate, and the products must be carried a great distance before reaching the Atlantic Ocean. The agricultural methods are incredibly primitive. Indian communities or wealthy townspeople own the farms; the Indians plow the land in a fashion that has been thus described:

Oxen are yoked by lashing a light crosspiece of wood immediately behind the horns. To this rude yoke is fastened the long beam of the wooden plow, which is almost exactly like those used by the people of Egypt thousands of years ago. It has but a single handle, and a flat piece of iron is fastened with rawhide at the point of the crooked stick. This cuts the soil to a depth of about six inches. Clods are broken by hand, and the ground is further prepared by dragging a heavy tree over it until the soil becomes smooth.

The roads are but narrow trails winding along the mountain sides, and are for the use of pack animals exclusively. Mules and llamas, driven by Indians, carry loads of coffee, cacao, cinchona bark, wool, and the precious metals.

Natural Wealth and Commerce.—The natural wealth of Bolivia may be shown by an enumeration of the products of its chief geographical divisions, called departments. The department of Potosí is exceedingly rich in silver, tin, and bismuth. Gold also is found in Chilco de Chichas; nitrate in San Cristobal de Lipez, and red and white copper, topazes, emeralds, opals, jasper, and marble in Lipez. The department of Tarija has an abundance of copper, silver, gold, asphalt, marble, etc. Sucre contains silver, tin, coal, lead, copper, gold, and mineral asphaltum. Cochabamba has gold mines that were famous during the time of the Spanish dominion; also silver and marble. Santa Cruz contains rich gold mines that are worked by the natives only; also large deposits of iron ore. La Paz contains famous mines, such as Tipuani and Yani (gold), and Chuquioguillo (silver). Copper, bismuth, tin, marble, antimony, and coal are also found. Oruro contains silver, tin, gold, copper, iron, lead, bismuth, antimony, sulphur, feldspar, borax, topaz, and amethysts.

Though ranking high in the production of silver, Bolivia is essentially an agricultural and grazing country. The province of Lipez has great herds of alpacas, vicuñas, sheep, and llamas. Alfalfa and barley grow in Chichas; sugarcane, coffee, wool, potatoes, cereals, flour, and fruits are produced in Charcas (Potosí). In the valley of the Paraguay River, department of Tarija, cacao, wines, maize, barley, and vegetables are the chief products. Cattle and horses abound upon the pasture-lands of the province of Azero. Rice, dairy products, and all varieties of fruits, European as well as tropical, are mentioned among the possibilities or actual achievements in the comparatively small portion of these eastern districts as yet brought under cultivation. Immense areas are covered with

rubber-trees, and valuable cabinet- and dye-woods, cedar, mahogany, etc., are among the unexploited treasures of the forests. The exports of rubber from the territory of Acré were 4,471,374 pounds in 1901. Geographically, a large part of northeastern Bolivia belongs to the Amazon River system, the natural outlet for its products being the waterways of Brazil; and until this opening to the commerce of the world is secured it will remain buried alive. See ACRE RIVER and SOUTH AMERICA.

The exports of the entire nation in 1901 amounted to \$13,621,237.56. The value of imports in the same year was \$6,120,113; of which amount Germany supplied merchandise of the value of \$1,170,755; England, \$827,358; France, \$690,331; United States, \$602,906; Chile, \$600,670; Peru, \$557,107; Belgium, \$471,451; Italy, \$245,252; Argentine Republic, \$218,334; Spain, \$131,570.

Government Receipts and Expenditures.—The budget for 1903 is even more surprising, when we consider the size and natural resources of Bolivia. The estimated receipts of the government to 1903 amount to only \$2,904,807.17; the expenditures for the same period, \$3,385,395.64; the deficit in the budget being \$480,588.47.

Population.—The population is classified as, (1) whites, (2) Quichuas, (3) Aymaras, (4) Chunchos. The first class is composed chiefly of descendants of the Spaniards. The second class is numerically the strongest in the republic, the Quichua Indians being commonly employed either as domestic servants or as laborers in the mines. In the third class are Indians of a distinct tribe, who are found in the department of La Paz and the high plains of the western portion of Bolivia, especially in the neighborhood of Lake Titicaca, where they are employed in pastoral and agricultural pursuits. As for the members of the fourth class, they are aborigines whose scattered tribes,—now inhabiting the eastern departments of Chuquisaca, Beni, and Santa Cruz, with a few representatives also in La Paz and the central department of Cochabamba,—have not even the bond of a common language. There are not sufficient data on which to base an opinion as to their tribal relationships, nor has it ever been possible to make a close estimate of their numbers. It is probable, however, that they are fragments of the original population of this land, displaced by successive waves of invasion, the Aymaras having been the next tribe to gain possession of the great upland plateau. The Quichuas came in at a much later date, when the empire of the Incas was extended from Cuzco, Peru, through this region. While Spanish is the language of the ruling element, both Quichua and Aymara are also in common use, even among the whites. Estimate of total pop. 1,800,000.

The professions, and the best positions in the army, the public service, and mercantile business, are monopolized by persons of European descent. Below them are the Mestizos (persons of blended Indian and European blood), more commonly known as "Cholos"—the tradesmen, soldiers, small shopkeepers, etc., constituting a middle class. Lowest in the social scale are the Indian farmers, day laborers, miners, and servants. The lines between

BOLIVIA

these classes being uncertain and disputable as the national boundaries, the structure of Bolivian society forbids the full acceptance of free political institutions.

History.—The country was formed in 1825 from the province of Upper Peru, and named in honor of the South American Liberator, Simon Bolívar. Partly within Peruvian and partly within Bolivian territory are the waters of Lake Titicaca, on the shores of which we find monuments of a civilization antedating the Inca conquest by about 600 years. From the earliest times, therefore, Peru and Bolivia must have been united. The Incas of Cuzco overran this district in the 14th century, and 200 years afterward Hernando Pizarro added it to the conquest his brother had made at the heart of the Inca empire. Under the Spaniards, then, it was known as the district or territory of the high court of Charcas, and remained subject to the viceroy of Peru until 1776, when it became a province of the new viceroyalty of Buenos Ayres. Before the coming of Pizarro the Sierra supplied a large part of the gold used for the decoration of the temples and palaces of the Incas; after the Spanish conquest the natives were driven to work, to continue or increase the output of precious metals for the benefit of masters whose ruthless severity was conspicuous even in that age. There is no entirely trustworthy record of the numbers of those who perished in the mines, but we know that a large Indian population was reduced to its present proportions in the course of two centuries. Taxation was oppressive; provincial governors became monopolists, from whom the natives were obliged to purchase their supplies; here, as elsewhere in America, colonists were forbidden to raise any crops or manufacture any articles which could interfere with the industries of the mother country. Commerce was so strictly limited to Spain that even neighboring colonies were forbidden to have commercial dealings with one another. Toward the end of the 18th century the resentment of the Indians was expressed in several insurrections (1780-82); early in the 19th the provinces of Rio de la Plata and Peru aided the Bolivians in their struggle for independence (July 1809 to August 1825). Gen. Santa Cruz was in command of the expeditions from Lima which failed to drive out the Spanish troops in 1823. But in the following year Gen. Sucre, marching from the same country at the head of an army encouraged by the victory of Ayacucho, was favored by a rising of patriots in all the principal towns. By February 1825 La Paz was in the power of the revolutionists, and in March the Spaniards lost their only remaining stronghold, the province of Potosí.

Deputies from the various provinces assembled at the capital to decide whether the relation of dependence upon Argentina should continue or not. In August they reached the conclusion that they would undertake their own government, and before the dissolution of this Assembly (6 Oct. 1825) independence was declared. The Constitution adopted then (subsequently modified in important respects) was prepared by Gen. Bolívar, and in accordance with the views entertained by the great Liberator at this period in his career, when he was master of Colombia and Peru as well, it vested the supreme authority in a president chosen for life.

The first incumbent was Gen. Sucre, who accepted the presidency for the space of two years only, and took the further precaution to retain 2,000 Colombian soldiers for his protection. In 1827 he and his Colombians were actually expelled from the country.

Since 1827 Bolivia has had seventeen presidents or dictators, the average duration of their terms being about four years. In 1828 Santa Cruz came into power and was confronted with a revolution the following year. In 1835, interposing in a quarrel of political factions in Peru, he defeated Gamarra, and named himself Protector of that country. Chile refusing to consent to the proposed union of her neighbors, three years of fighting ensued. Santa Cruz was defeated and exiled in 1839, but his party in Bolivia kept up the agitation and finally conferred the presidency upon Gen. Ballivian. Meanwhile Gamarra, who had become President of Peru, tried to annex the department of La Paz. He lost his life in this attempt, and then the Bolivians in their turn would have invaded Peru if Chile had not again intervened. Ballivian surrendered his thankless task in 1848. The next President, Belzu, was borne into office on the crest of a wave of revolution; by a revolutionary storm his successor, Cordova, was driven from office and from the land. Linares made himself Dictator in 1858, and was deposed in 1861. President Acha, his successor, fell from power when his forces were defeated in battle by his political antagonist, Melgarejo (February 1865). The latter may be characterized as a revolutionist until 1865; President from that time until 1869; Dictator from 1869 to 1871. Morales, elected in the year last mentioned, was succeeded in 1873 by Ballivian, who died before a twelvemonth had passed. Frias, next to take office, was deposed two years later by the troops, who proclaimed Gen. Daza President.

In 1878 Bolivia and Peru were at war with Chile, and the defeat of the allies after 18 months of hopeless struggling against a well-prepared enemy stripped from the weakest of the contestants her only possessions on the Pacific. Bolivia became a landlocked country. The national anger vented itself first upon the President whom the army had lifted up, and who now fled to escape assassination. But Campero, whom Congress chose to carry on the war, and who personally led the Bolivian troops in the field, was wholly unable to oppose Chile's demands alone, and Peru was an ally without power to aid. Bolivia saw herself obliged to acquiesce in an arrangement which some of her leaders have not yet ceased to regard as provisional and temporary. Her bit of coast line and most of the coveted nitrate of soda deposits in the districts of Cobija and Tarapacá,—territory aggregating 70,181 square miles, with about 6,000 inhabitants,—passed into Chile's keeping. (For an account of the war on the Pacific, see CHILE: PERU.)

Coincidentally, the failure in 1879-80, after years of effort, to secure the opening of a commercial outlet for Bolivian products to the Atlantic through the Amazon River and its great tributary, the Madeira, was a severe blow. The American contractors for the Madeira and Mamoré Railway of Bolivia and Brazil were deprived of the funds necessary to the prosecution of the enterprise by the withdrawal of the loan that had been placed in England in 1872 for the

purpose of constructing this much-needed road. The decision to abandon the undertaking was reached after years of litigation, the final appeal being heard in the British House of Lords.

The Constitution of 28 Oct. 1880 vested the legislative power in a Senate and House of Representatives, and the executive power in a president elected for four years by direct universal suffrage. But little or no improvement in the political situation was observed. President Campero was succeeded by Gregorio Pacheco, and then came Aniceto Arce (1 Aug. 1888). It was necessary to declare a state of siege in all parts of the republic in the summer of 1890. Attempts were made to overthrow the government, and a number of political leaders were arrested. The election of a successor to President Arce took place 3 May 1892. Violent collisions between the rival factions again compelled the authorities to proclaim a state of siege—which was continued even after the inauguration of the new president, Baptista, on 6 August. Indian revolts also occurred in this year, originating in both the north and the south, and spreading rapidly through the entire country. The barbarous practices of the Indians were, as is usual in this most repulsive species of warfare, matched by the repressive measures of the Bolivian troops.

Chile furnished arms and money to uphold the Baptista government; and the dependence of the country without sea coast upon the country all sea coast was recognized in the treaty of 1903. Bolivia had been placed in a position such that any one of her three powerful neighbors,—Chile, Argentina, or Brazil,—could win her allegiance by conferring substantial favors, or even by a display of international courtesy. Following Chile's diplomatic overtures, Argentina undertook to open up a way to the sea by a new railroad connecting the Sierra with her river system. Brazil's attitude remained in doubt, until the treaty of 17 Nov. 1903 showed that Acré, competing with Brazil in the production of rubber, was demanded as the price of any concession of a right of way. Some of the neighboring states have, in times not long past, actually discussed the disposition to be made of Bolivia, as though this interesting country were a South American Poland.

It can hardly be said that Bolivia has given evidence of greater political stability in recent years. When Fernandez Alonzo was elected to the presidency in 1896 his opponents protested that the government had tampered with the returns in such a way as to change the expression of the people's will under the constitutional guaranty of universal suffrage, and an uprising was successful in April 1899. The revolutionists, under Col. José Manuel Pando, defeated the government forces in a pitched battle; President Alonzo fled over the Andes into Chile, and the government which has maintained itself until 1903 was organized, with Señor Pando at its head.

MARRION WILCOX,
Authority on Latin-America.

Bolkhov, bōl-kōf' Russia, capital of a district of the same name in the government of Orel, on the Nuga. It is a very ancient place, and is chiefly built of wood. It has manufactures of leather, glue, soap, etc., and a considerable trade in hemp, hemp-oil, and tallow, amounting to more than \$800,000 annually. Pop. (1903) 26,265.

Boll (from the Saxon *bolla*, a bowl), an old Scotch measure for corn, varying in different districts and for different articles. A boll of wheat or beans was equal to four bushels, a boll of oats to six bushels. The boll is still used in some parts of Scotland, but is no longer legally recognized.

Bol'lan, William, lawyer; b. England; d. Massachusetts, 1776. In 1740 he settled in Boston, Mass., married a daughter of Governor Shirley in 1743, and became advocate-general. In 1745 he was sent to London as the colony's agent, a post of great responsibility and requiring considerable ability in the holder. After three years of negotiating he secured from the English government the repayment of £183,649 advanced by Massachusetts for the Cape Breton expedition. In 1769 he secured and sent over to Massachusetts 33 letters of Gov. Bernard and Gen. Gage, denouncing and calumniating the colonists. He wrote a number of political tracts and pamphlets favoring conciliation with the colonists. Among them were: 'The Mutual Interests of Great Britain and the American Colonies Considered'; 'Continued Corruption of Standing Armies'; 'The Free Briton's Memorial, in Defense of the Right of Election'; 'Importance of the Colonies of North America and the Interests of Great Britain with Regard to Them Considered'; 'Petition to the King in Council, 26 Jan. 1774, with Illustrations

tions Intended to Promote the Harmony of Great Britain and Her Colonies'; 'The Importance of Cape Breton Illustrated'; etc.

Bollandists, a society of Jesuits which published, under the title 'Acta Sanctorum,' the well-known collection of the lives of the saints of the Roman Catholic Church. They received this name from John Bolland (died 1665), who edited the first five volumes from materials already accumulated by Heribert Rosweyd, a Flemish Jesuit, whose collections were entrusted to Bolland at his death in 1629. On the abolition of the society of Jesuits in 1773, it was removed to the monastery of Candenberg, in Brussels. The abolition of the monasteries by Joseph II. brought about its dissolution. A new association was formed in 1837 under the patronage of the Belgian government, and by it the publication of the great work was continued.

Bolles, Albert Sidney, writer on finance: b. Montville, Conn., 8 March 1846. He practised law for a time; then became editor of the *Norwich (Conn.) Bulletin*, and later of the *Banker's Bulletin*. For more than four years he was professor of mercantile law and banking in the University of Pennsylvania, and for eight years chief of the Pennsylvania Bureau of Industrial Statistics. Publications: 'Chapters on Political Economy'; 'Conflict Between Labor and Capital'; 'Industrial History of the United States'; 'Financial History of the United States, 1774-1885,' his most important work; 'Practical Banking'; 'The National Bank Act and its Judicial Meaning'; 'Pennsylvania, Province and State, 1609-1790.'

Bolles, Frank, author: b. Winchester, Mass., 31 Oct. 1856; d. Cambridge, Mass., 10 Jan. 1894. He graduated at Harvard Law School in 1882, and while there founded and became first president of what is now the Harvard Co-operative Association. He was an associate editor of the *Boston Advertiser* until chosen secretary of Harvard University in 1886. That office he made thoroughly human to the great gain of both students and faculty. He was in the truest sense the students' friend, and he endeared himself to hundreds, especially the diffident ones and those of limited means, by many acts of helpfulness. In a series of judicious and clear pamphlets he set forth the actual working of Harvard, its methods of instruction, the scope of its departments, etc., and did much to correct the impression that it was a rich man's college. He wrote three works of exceptional literary merit: 'Land of the Lingering Snow,' sketches written on an abandoned farm in the heart of the White Mountains; 'At the North of Bearcamp Water'; and 'From Blomidon to Smoky, and Other Papers.' In his descriptions of nature and scenery he is absolutely impersonal, and impartial as a scientist; he never moralizes or indulges in sentiment.

Bollman, Eric, adventurer: b. Hoya, Hanover, 1769; d. Jamaica, W. I., 9 Dec. 1821. He was a physician at Paris during the Revolution, accompanied the refugee, Count Narbonne to London in 1792, then established practice in Vienna to discover Lafayette's place of imprisonment. Finding it to be Olmütz, he joined an American named Francis K. Huger in rescuing him, though he was recaptured. Bollman was imprisoned nearly a year in Austria, then re-

leased on condition of leaving the country. He came to America, was in Philadelphia for years, then joined Burr's conspiracy in 1806 and was his agent in New Orleans; was apprehended and committed for treason in 1807, but discharged for lack of evidence (see below). In 1814 he returned to Europe, finally settling in London.

Bollman's Case, in United States law. Eric Bollman (above) was committed on probable suspicion of treason, 27 Jan. 1807, by the circuit court of the District of Columbia; the supreme court was moved for a writ of *habeas corpus ad subjiciendum* (the great writ against illegal confinement) to the marshal to bring him before the court. The questions were whether the court had the initial power to grant such writs, and if so, whether it could grant them against committals by the circuit court. John Marshall decided that it had such right both by common law, as the right of any superior court of record to guard the liberty of the citizen, and by express grant from Congress; and that the allegation of treason was immaterial, as the writ would be useless without the power to go behind the lower court's action and decide on the merits. William Johnson dissented. On the marshal's return it was moved that Bollman be discharged, because no place of commission of the treasonable act was cited, and because the evidence was insufficient and the crime even if proved did not amount to treason. It was decided that there must be an actual levying of war, not merely intent to do so to constitute treason, that the evidence at best did not even prove that, but only a culpable attempt against a power with which the United States was at peace.

Boll Weevil. See COTTON INSECTS.

Bollworm, a southern name for a caterpillar which bores into cotton balls. In the north it is called "corn worm." See COTTON INSECTS.

Bo'lo, the national weapon of the Filipinos. The blade is about 18 inches in length by nearly 3 inches in breadth at its broadest dimension. It tapers from the middle toward the haft as well as toward the point, making it strongly resemble the ancient short sword. It is not double edged, however, but tapers from a thick back to an extremely keen edge. The scabbard of the bolo is made of a native wood with rough outlined designs carved upon it. The whole weapon is much more beautiful in outline and more formidable than the Cuban machete.

Bologna, Giovanni di, jō-vān'ne de bō-lō'-nya, sculptor and architect: b. Douai, in Flanders, about 1524; d. Florence, 1608. At an early age he went to Rome, where he passed two years in studying the masterpieces of art. Going to Florence, he was attracted by the works of Michael Angelo, and determined to pass the rest of his life there. He rapidly rose to the foremost rank among sculptors, and few artists were charged with the execution of so many and such important works. His surname of Bologna seems to have been derived from the celebrated fountain in that city, designed by himself, of which the crowning colossal figure of Neptune is one of the wonders of the modern city. His fine statue of Duke Ferdinand is said to have inspired Browning's poem, 'The Statue and the Bust.'

BOLOGNA — BOLOMETER

Bologna, bō-lō'nyā, Italv (anciently **BONONIA**), capital of the province of the same name. It lies at the foot of the Apennines, between the rivers Reno and Savena, 190 miles north-northwest of Rome. Bologna is five or six miles in circumference, and is surrounded by an unfortified wall of brick. It is an archbishopric, and has a tribunal of appeal in the first instance, and of commerce. It has extensive manufactures of silk goods, velvet, artificial flowers, etc. The town consists of four quarters, the older poorly, and the modern handsomely built. There are colonnades along the sides of the streets affording shade and shelter to the foot-passengers. Bologna was long renowned for its university, founded, according to tradition, by Theodosius the younger in 425, but more probably not till 1088, which, in the centuries of barbarism, spread the light of knowledge over all Europe. It once had 10,000 students, but the number is now about 1,500 only. Here the famous Irnerius taught the civil law in the 11th century, and students were attracted from every quarter. Several learned ladies have at different times been professors here, such as Laura Bassi, professor of mathematics and natural philosophy, and Matilda Tambroni, professor of Greek, and the predecessor of the famous Cardinal Mezzofanti. The university formerly possessed so much influence, that even the coins of the city bore its motto — *Bononia docet* ("Bologna teaches"). The law school enjoyed the greatest fame. Its teachers had the reputation of inculcating principles favorable to despotism, and were consequently rewarded by the favor of the emperors, and of the Italian sovereigns. Every new discovery in science and the arts found a welcome, and here Galvani discovered galvanism (1789). The medical school is celebrated for having introduced the public dissection of human bodies, and the scientific journals prove that the love of investigation is still awake in Bologna. The university, indeed, still enjoys an excellent reputation, and is well provided with scientific collections, the anatomical collection being especially extensive. It possesses in all five faculties. The university library numbers about 170,000 volumes, with 6,000 manuscripts. Since 1803 the university buildings have consisted of what was formerly the Palazzo Cellesi. The original university building now accommodates the public library, of some 200,000 volumes. The city has a picture-gallery (in the Accademia delle Belle Arte) and a museum of archæological and other objects. In the 16th century the famous painters and sculptors, Carracci, Guido Reni, Domenichino, and Albani, founded a school, to which their works have given great reputation. There were, even as early as the 12th and 13th centuries, great painters in Bologna. Francesco Francia was famous in the 15th and early part of the 16th century. The city picture-gallery is rich in the works of these and other artists, the gem of the whole being Raphael's St. Cecilia.

The chief square of the city, Piazza Vittorio Emanuele, formerly the Piazza Maggiore, with the Piazza del Nettuno at right angles, is adorned by several venerable buildings; among them are the Palazzo Comunale (or Del Governo), which contains some magnificent halls, adorned with statues and paintings; Palazzo del Podestà (dating from 1201), now the town hall, chiefly remarkable as having been

the prison of Enzius, king of Sardinia, and son of the Emperor Frederick II., who was captured and kept here by the Bolognese for more than 20 years, till his death; and the church or basilica of St. Petronio, with its unfinished front and the meridian of Cassini drawn upon a copper plate in the floor. Among the hundred other churches, the following are distinguished: St. Pietro (the cathedral), St. Salvatore, St. Domenico (containing the tomb of the saint), St. Giovanni in Monte, St. Giacomo Maggiore, all possessed of rich treasures of art, and St. Stephano, consisting of seven different churches, and partly dating from the 10th century. The palaces are numerous, and were formerly enriched with numerous and valuable works of art. Many of these have now disappeared, though frescoes and other internal decorations still remain. The admired fountain of the Piazza del Nettuno is adorned with a Neptune in bronze, by John of Bologna; in the Piazza Vittorio Emanuele is an equestrian statue of Victor Emanuel II. The leaning towers, Degli Asinelli, and Garisenda, dating from the 12th century, are among the most remarkable objects in Bologna. The former is square and of massive brickwork, built in three portions, and diminishing in diameter to the top. Its height is 321 feet, and its inclination from the perpendicular 4 feet. The Garisenda is 163 feet high, and inclines about 10 feet. Bologna is famous for macaroni, sausage, liqueurs, and preserved fruits. The pilgrimage to the Madonna di S. Luca, whose church is situated at the foot of the Apennines, three miles distant from Bologna, and to which an arcade of 640 arches leads, annually attracts a great number of people from all parts of Italy. This and other places in the environs may be reached by steam tramway.

Bologna was founded by the Etruscans under the name of Felsina, before the foundation of Rome. In 189 B.C. it was made a Roman colony, and called Bononia. On the fall of the Roman empire, it was taken by the Longobards, then it passed into the hands of the Franks, and was made a free city by Charlemagne. In the 12th and 13th centuries it was one of the most flourishing of the Italian republics; but the feuds between the different parties of the nobles disturbed the stable government of the city, and led to its submission to the papal see, and incorporation in the states of the Church, in 1506. Several attempts were made to throw off the papal authority, one of which, in 1831, was for a time successful. In 1849 the Austrians obtained possession of Bologna, and made it the headquarters of their 2d Italian Corps. In 1860 Bologna was by popular vote annexed to the dominions of King Victor Emanuel. Pop. (1899) 158,975.

Bologna Phial, a small flask of unannealed glass, which flies into pieces when its surface is scratched by a hard body or a sharpened body dropped into it. It is prepared by the glass-maker as a test of the condition of a pot of metal before he fashions it into bottles or glasses.

Bologna Stone, or **Bologna Phosphorus**. See **BARIUM** and **BARITE**.

Bolometer ("ray-measurer"), an instrument invented by Prof. S. P. Langley, secretary of the Smithsonian Institution, for detect-

ing and measuring small quantities of radiant heat. It consists essentially of a balanced Wheatstone's bridge (see RESISTANCE, ELECTRICAL), one of whose arms is formed by a thin strip of platinum foil, blackened to facilitate the absorption of heat. The bridge being in equilibrium, with no current passing through the galvanometer, a ray of radiant heat falling upon the platinum strip warms it slightly, thereby increasing its electric resistance, destroying the balance of the bridge, and causing an electric current to flow through the galvanometer. By comparing the current so produced with that produced by a source of heat, the intensity of the radiation of which is known, an estimate may be formed of the quantity of heat received from the body under investigation. The instrument is so delicate that it can detect a change of temperature, in the platinum strip, amounting to the hundred-thousandth part of a degree, Fahrenheit. Prof. Langley considers that it is also capable of measuring small quantities of radiant heat with an error of not more than one per cent. The bolometer was first devised for the purpose of studying the distribution of heat in the solar spectrum, and it has yielded much valuable information on this subject, especially in the infra-red regions, where Fraunhofer lines exist, although they are invisible to the eye and can only be photographed with difficulty. For more extended descriptions of the instrument, see 'Proceedings of the American Academy of Arts and Sciences' (1881, Vol. XVI. p. 342); also 'Annals of the Astrophysical Observatory of the Smithsonian Institution' (1900, Vol. I.).

Bolor Tagh, bō-lōr' tåg, also **Bilaur**, or **Belut Tagh**, a mountain range formerly imagined to exist in central Asia between eastern and western Turkestan, as the axis of the continent. At that point, however, there is really a lofty tableland called the Pamir.

Bolsas, a river of Mexico, which, after flowing west, enters the Pacific Ocean, 225 miles southwest of Mexico City.

Bolsec, Jérôme Hermès, zhā-rōm hēr-māz bōl-sēc, French writer: b. early in the 16th century; d. 1585. He became first, it is said, a monk, but subsequently embraced the doctrines of the Reformation and became a medical practitioner. After retiring to Italy, and remaining for some time at Ferrara, he repaired to Geneva, and insinuated himself into the good graces of Calvin. A quarrel afterward took place, occasioned, it is said, by the opposition of Bolsec to the doctrine of absolute election. It issued in his imprisonment and ultimate banishment from Geneva. He was driven later on also from Lausanne through the influence of Beza. He latterly returned to France, and having formally abjured Protestantism, settled as a physician in Lyons. He acquired considerable notoriety by the violence of his philippics against Calvin and Beza, in which, under the name of their Lives, he has raked together and published all sorts of scandal. This at least is the common view of Protestant writers.

Bolsena, bōl-sā'na, Italy, a town on the lake of the same name; 56 miles north-northwest of Rome. In the immediate vicinity stood the ancient Volsinium, one of the most powerful of the Etruscan cities. Some remains of its temples, including several granite columns, are still in existence. The lake of Bolsena, which is

supposed to fill an ancient crater, exhales a deadly malaria during the summer season. It is about 9 miles long, 7 miles broad, and 285 feet deep. The shores are formed by finely wooded hills, presenting much beautiful scenery; it has two small islands, called Martana and Bisentina, believed once to have been floating, and it discharges its surplus waters into the Mediterranean by the Marta River.

Bolsward, bōl'svārt, Holland, a town in the province of Friesland, 15 miles southwest of Leeuwarden, at the junction of several canals, and intersected by canals crossed by numerous bridges. The parish church is said to be the largest and finest in Friesland. The trade of Bolsward consists chiefly in cattle, cheese, and butter. Pop. (1902) 6,500.

Bolswert, bōl'svĕrt, **Boetius Adam**, called Bolswert after his native place in Friesland, Dutch engraver: b. about 1580; d. 1634. He was the author of many valuable engravings after designs of Bloemaert and Rubens. His younger brother, SCHELTJUS ADAM, rose to higher fame in the same art, especially distinguishing himself by his prints after some of the best works of Rubens and Vandyke. Both brothers practised their art at Antwerp.

Bolt Court, a residential court in London, off Fleet Street, near Saint Bride's Church, in which Cobbett and Dr. Samuel Johnson lived for some years.

Bolt-ropes, ropes used to strengthen the sails of a ship, the edges of the sails being sewn to them. Those on the sides are called leech-ropes, the others head and foot ropes.

Bolti, or **Bultĕe**, an edible chichlid fish of the Nile.

Bolting-cloth, a closely woven fabric, generally of silk, used for sifting flour. See FLOUR.

Bolton, Charles Edward, American lecturer and writer: b. South Hadley Falls, Mass., 16 May 1841; d. East Cleveland, Ohio, 1901. He inaugurated the Cleveland Educational Bureau; lectured extensively in the United States and Canada; and was mayor of East Cleveland in his latest years. He published: 'A Few Civic Problems'; 'A Model Village' (1901).

Bolton, Charles Knowles, American poet and miscellaneous writer, son of Mrs. Sarah Knowles Bolton: b. Cleveland, Ohio, 14 Nov. 1867. He has been librarian of the Boston Athenæum Library from 1898. He has written: 'Gossiping Guide to Harvard'; 'Saskia, the Wife of Rembrandt'; 'The Wooing of Martha Pitkin'; 'Love Story of Ursula Wolcott'; 'The Private Soldier Under Washington' (1903).

Bolton, Henry Carrington, American scientific writer: b. New York, 1843; d. Washington, D. C., 17 Nov. 1903. He graduated at Columbia University and studied abroad; became professor of chemistry and natural science at Trinity College, Hartford, Conn. In 1900 he was elected president of the Chemical Society of Washington, D. C. He wrote: 'The Counting-Out Rhymes of Children, a Study in Folk-Lore' (1888); 'Literature of Manganese'; 'Students' Guide in Quantitative Analysis'; 'The Evolution of the Thermometer, 1592-1743' (1900).

Bolton, Sarah Knowles, American author: b. Farmington, Conn., 15 Sept. 1841. She married Charles E. Bolton (q.v.), lecturer and

BOLTON — BOMBARDIER

philanthropist, and resides in Cleveland, Ohio. She is the author of a number of books, including: 'Girls Who Became Famous' (1886); 'Famous American Authors' (1887); 'Famous American Statesmen' (1888); 'Famous Types of Womanhood' (1892); 'The Inevitable and Other Poems' (1895); 'Our Devoted Friend, the Dog' (1901); etc.

Bolton, Sarah Tittle, American poet: b. Newport, Ky., 18 Dec. 1815; d. Indianapolis, 4 Aug. 1893. She is known for her patriotic and war poems, including 'Paddle Your Own Canoe'; 'Left on the Battlefield'; etc. Her collected 'Poems' appeared in 1865 and 1886.

Bolton, or Bolton-le-Moors, a manufacturing town of Lancashire, England, 10 miles northwest from Manchester. It consists mainly of two divisions, Great Bolton and Little Bolton, separated from each other by the river Croal. The older portion of the two contains many narrow and irregular streets, but by far the larger portion of the town is modern. About \$2,500,000 has been recently expended in street improvements. The finest of the public edifices is the town-hall, in the Grecian style, with a tower 220 feet high, fronting a spacious square, and erected at an expense of about \$1,000,000. Among other public buildings are one of the finest market-halls in England, costing, with its approaches, nearly \$500,000; a church institute; a temperance-hall; commodious baths; savings-bank; two theatres; two technical schools; a post-office, gas offices, county court, infirmary and children's hospital; orphanages; Chadwick and Mere Hall museums; board schools; poor-law offices, etc. The religious edifices are numerous, and some of them of fine architectural appearance. Foremost among these is St. Peter's parish church, a modern cruciform building in the Decorated style, with a tower at the western end 150 feet high. The schools are numerous and well attended, and, under the school board, education is rapidly improving. There is a free grammar-school, founded in 1641. The Bolton Free Public libraries (six in number) contain over 93,000 volumes. There are now four parks and three recreation grounds belonging to the town. In manufacturing industry Bolton is surpassed by few places in the kingdom, the cotton manufacture being its staple. It contains some of the largest and finest cotton mills in the world. In the town itself there are some 370 factories, of which nearly 140 are cotton mills and establishments for the weaving of cotton fabrics. The yarns spun in Bolton are generally fine, and a great variety of fancy goods are produced, besides plain calicoes. Bleaching is also carried on to a great extent, there being over 20 bleaching grounds, some of them very large. There are also several large engineering works, employing a great many hands. Besides these there are collieries, paper mills, foundries, chemical works, and various other works. Bolton is of considerable antiquity, having been raised to the dignity of a market-town in 1256. It returns two members to Parliament. Pop. (1901) 168,205.

Bolton Abbey, a famous English Abbey in Yorkshire; in a highly picturesque district on the river Wharfe, six miles east of Skipton, and 21 miles northwest of Leeds. Founded for Augustinian canons about 1150, it has been celebrated by Wordsworth in 'The White Doe of

Rylstone' and 'The Force of Prayer.' The eastern end is a ruin, but the nave is utilized for the purposes of a parish church.

Bolyai, Farkas, Hungarian mathematician: b. Bolyai 1775; d. 1856. He obtained his early education in Enged, Klausenburg, and Jena, and for three years (1796-9) studied at Göttingen. He later became professor of mathematics in the Reformed College of Maros-Vósárhely, a position which he very efficiently held for 47 years. He made several attempts to prove Euclid's postulate of parallelism, but it remained to his son to finally declare the *science absolute of space*, assigning the Euclidean geometry to a particular kind of space. His chief work, however, was known as 'Teutamen,' which later contained an appendix of 26 pages to Vol. I., called 'Scientiam Spatii Absolute Veram Exhibens,' written by his son János, and which has since become famous.

Bolzano, Bernhard, Bohemian Roman Catholic theologian and philosopher: b. Prague, 5 Oct. 1781; d. 18 Dec. 1848. From 1805 to 1820 he was professor and chaplain at the University of Prague, but was accused of insidiously instilling into the minds of the students the heresies of Schelling and Hegel, and was dismissed from his office. He left many writings, of which his 'Wissenschaftslehre' (1842) is the most important. Consult 'Autobiography' (1875).

Bomarsund, a narrow channel between the islands of Aland and Vardö, at the entrance of the Gulf of Bothnia. The Russian fortifications to the harbor of Bomarsund were destroyed by the British and French fleets during the war of 1854. The channels leading up to Bomarsund were blockaded at the end of July by four British ships and a few small steamers. Shortly afterward strong detachments of the allied fleets arrived, with the admirals Napier and Parseval-Deschênes, followed, 7 August, by the line-of-battle ships with Gen. Baraguay d'Hilliers and 12,000 troops, mostly French. The Russian commander, Gen. Bodisco, was compelled to surrender on 16 August, the allies continuing to occupy the island until the end of the month, when the whole of the fortification was blown up. The trophies of the victors were 112 mounted guns, 79 not mounted, 3 mortars, 7 field guns, and 2,235 prisoners. The principal military interest offered by this siege is its setting at rest the question of the employment of uncovered masonry in fortifications with land-fronts.

Bomb, a hollow, cast-iron ball or shell, filled with gunpowder, or other combustible, and exploded by means of a time-fuse, being commonly thrown from a mortar. Instead of spherical bombs, elongated shells fired from rifled guns are now in general use. See also AMMUNITION; PROJECTILES.

Bomb Lance, a harpoon used in whale fishing which carries a charge of explosive material in its head. In one form of the weapon the arrangement is that when the harpoon strikes the fish, the bar, which is pivoted obliquely in the head of the instrument, shall serve to release a spring acting on the hammer, which then explodes the cap and bursts the charge chamber.

Bombard. See BOMBARDMENT.

Bombardier, originally an artillery soldier whose special duties are connected with the loading and firing of shells, grenades, etc., from

BOMBARDIER-BEETLE — BOMBAY

bombards, mortars, or howitzers. Bombardier is now the special title of a non-commissioned officer in the British artillery ranking with a corporal.

Bombardier-beetle, or Artillery-beetle, an insect of the genus *Brachinus*, and family *Carabidae*. The head is narrow, the prothorax heart-shaped. While certain other beetles have at the end of the body two glands which secrete a malodorous fluid which they eject as a means of defense against their enemies, in the bombardier-beetle this fluid or spray appears to be charged with a gas, which, on coming in contact with the air, looks like smoke, and is ejected with an explosion like that of a miniature pop-gun. This gas-like vapor and detonation baffles and discomfits the pursuer (most often some other predatory beetle) as if blinding it. When being captured they will fire off this discharge several times. Several of the species (*B. fumans* and allies) are yellowish-red, with bluish and greenish elytra.

Bombardment, the act of throwing bombs or shells into a town or fortress for incendiary purposes. A bombardment is either desultory, when ships, field batteries, or a proportionately small number of siege batteries, throw shells into a place in order to intimidate the inhabitants and garrison into a hasty surrender, or for some other purpose; or it is regular, and then forms one of the methods of conducting the attack of a fortified place. The attack by regular bombardment was first introduced by the Prussians in their sieges in 1815, after Waterloo, of the fortresses in the north of France. The army and the Bonapartist party being then much dispirited, and the remainder of the inhabitants anxiously wishing for peace, it was thought that the formalities of the old methodical attack in this case might be dispensed with, and a short and heavy bombardment substituted, which would create fires and explosions of magazines, prevent every soul in the place from getting a night's rest, and thus in a short time compel a surrender, either by the moral pressure of the inhabitants on the commander, or by the actual amount of devastation caused, and by out-fatiguing the garrison. The regular attack by direct fire against the defenses, though proceeded with, became secondary to vertical fire and shelling from heavy howitzers. In some cases a desultory bombardment was sufficient, in others a regular bombardment had to be resorted to; but in every instance the plan was successful; and it is now a maxim in the theory of sieges, that to destroy the resources, and to render unsafe the interior of a fortress by vertical fire, is as important (if not more so) as the destruction of its outer defenses by direct and ricochet firing. A bombardment will be most effective against a fortress of middling size, with numerous non-military inhabitants, the moral effect upon them being one of the means applied to force the commander into surrender. Before bombarding a town, it is customary to give 24 hours' notice thereof, to allow women, children, and non-combatants to leave it. Modern bombardments have not usually been particularly destructive. During the siege of Paris, 1870-71, some 500

shells were thrown into the city by the Germans, but relatively little mischief was accomplished by them. A similar result was shown at the bombardment of Santiago de Cuba by the American forces in 1898, and also in the long sieges of Ladysmith and Kimberley in 1899-1900. See also SIEGE.

Bombardon, a large brass musical instrument of the sax-horn kind, and the lowest of these instruments. It is made in more than one size, and the largest is generally of circular form and big enough to go round the body of the performer. It is not capable of very rapid execution.

Bombastes Furioso, a burlesque opera by William Barnes Rhodes, produced in 1790 and intended as a parody of 'Orlando Furioso.' Its name is that of the principal personage, a braggard who kills his king, Artaxominous, for a pair of jack-boots.

Bombax (SILK COTTON TREE), a genus of 10 or 12 tropical trees of the natural order *Malvaceæ* with digitate leaves and large scarlet or white axillary flowers. *B. ceiba*, the five-leaved silk cotton tree, attains a great height in tropical America, where it is native and where its immense trunks are scooped out for canoes. This species, *B. munguba*, another South American species, and *B. malabaricum*, the red silk cotton tree, so named from the color of its "cotton," bear pods which furnish a fibre useful for stuffing cushions; hence the common name. All the species yield useful bast employed in rope making, and have been suggested as possibly valuable for paper making.

Bombay, a presidency of British India, stretching along the west side of the peninsula, and bounded on the land side by Baluchistan, the Punjab, Rajputana, native states of the Central India Agency, the Central Provinces, Berar, Haidarabad, Madras, and Mysore; and on the west by the Arabian Sea. The divisions are: Sind, the least populous, Gujerat, the most populous, Deccan, Konkan, and Karnatik. The presidency also includes many feudatory states. The chief towns are Bombay, Poona, Ahmedabad, Surat, and Karachi. The chief spoken languages are Marathi, used by nearly half the population; Gujrathi, used by the commercial classes; Kanarese, and Sindhi. About three fourths of the population profess Hinduism, fully one sixth are Mohammedans, the rest being Jains, Christians, Sikhs, Parsees, aboriginals, etc.

The chief openings in the coast of Bombay are the gulfs of Cambay and Cutch, separated by the peninsula of Kathiawar. The chief harbors are those of Bombay and Karachi. The river Nerbudda which enters the Gulf of Cambay, divides the province into two physically distinct parts. North of it are Gujerat and Sind, with the peninsulas of Cutch and Kathiawar, mostly a fertile alluvial plain. Much of Sind, however, is a desert, crossed by low sand-hills. South of the Nerbudda, the province presents a narrow flat strip of coast, rising inland toward the upland country of the Western Ghats and the Deccan. The chief mountain ranges are the Hala Mountains, west of the Indus, the Western Ghats, running north and south, and the Satpura range, separating the basins of the Nerbudda

BOMBAY.

VICTORIA RAILWAY STATION.

BOMBAY — BOMBON

and the Taptee. The most important rivers are the Indus, Nerbudda, and Taptee, all of which flow into the Arabian Sea; the Godavari and Kistna rise on the eastern slopes of the Ghats. Many short torrential rivers traverse the Konkan coastal strip. The forests of Sind consist chiefly of sisu, babul (a kind of acacia), bhan (a species of poplar), and tamarisk; while from the forests of the western slopes of the Ghats are obtained teak, blackwood, ebony, ironwood, babul, sandalwood, and other valuable timbers. The cocoanut and date palms, mango, jack, betel-nut, and myrobalans are other important indigenous vegetable products. Among the wild animals are the maneless lion of Gujerat, the wild ass, leopard, tiger, black bear, bison, antelopes, and venomous snakes. The climate varies greatly from one district to another, two extremes being represented by Upper Sind, with great heat and little rain, and the Konkan, with excessive rainfall, especially from June to October. The chief agricultural productions are cotton, rice, millet, wheat, barley, dates, the cocoa-palm, oil-seeds, sugar, and indigo. The area of the presidency under British administration is 124,122 square miles. Pop. of British portion of the presidency (1901) 18,584,496, and of the native states, 6,891,691. See Drew, 'Bombay and Its Feudatories' (1892); Douglas, 'Glimpses of Old Bombay and Western India' (1900). The growth of cotton in Bombay received a great impetus during the American Civil War; and although the great demand did not prove lasting, cotton continues to be a highly important crop, part of the produce being exported, and a considerable portion of it worked up in the cotton-mills of Bombay. The total number of pupils receiving education at primary and other schools amounts to about 750,000, of whom only about one eighth consist of females. The annual revenue largely exceeds the expenditure, and latterly has amounted to about \$75,000,000.

Bombay, a city and seaport on the west coast of India, capital of the presidency of the same name, situated at the southern extremity of the island of Bombay, and connected with the mainland and the interior by extensions of the Bombay and Baroda, and the Great Indian and Peninsula Railways, the terminus of the latter being a splendid edifice which cost \$15,000,000. Extensive water-works have been constructed on the mainland, including a dam two miles in length, and were opened in 1892. The town comprises two main portions, one known as the Fort, and formerly surrounded with fortifications, on a narrow point of land with the harbor on the east side and Back Bay on the west; the other known as the City, a little to the northwest. The European population live partly in the Fort quarter, but mostly in villas surrounded with extensive areas, called compounds, in various parts of the island. Bombay has many handsome buildings, both public and private, and a number of fine streets, the latter being in many cases traversed by street railways. The castle, the government offices, and almost all the merchants' warehouses and offices are in the Fort. On the esplanade facing southwest

is a fine range of public buildings, including the secretariat, the new high court, the offices of the public works department, the post and telegraph offices, etc. There are a cathedral and several other churches in Bombay, which is the see of an Anglican bishop. There are also some fine hotels. In 1859 a university was opened. Various industries, such as dyeing, tanning, and metal working, are actively carried on, and there are now nearly 100 cotton-mills. The commerce of the port is very extensive, by far the greater portion of the exports and imports of the presidency passing through Bombay. The chief article of export is raw cotton, the chief import cotton piece goods, the commerce being chiefly with Great Britain. The harbor is one of the largest and safest in India; while its scenery and that of the neighboring continent presents a rare combination of grandeur and beauty. It is situated between the islands of Colabah, Bombay, and Salsette on the one hand, and the mainland and islands of Caranjah and Elephanta on the other. There are large and commodious docks, the ships and basins being calculated for vessels of any size. There is a large traffic with steam vessels between Bombay and Great Britain, and regular steam communication with China, Australia, Singapore, Mauritius, etc. A railway between Bombay and Tannah, on the island of Salsette, 20 miles distant, opened in 1853, was the first Indian railway constructed. Pop. (1901) 770,800. The island of Bombay is about 11 miles long from north to south, and about three miles broad, formed by two ranges of rock running parallel to each other on opposite sides of the island. The interior was formerly liable to be overflowed by the sea, to prevent which substantial walls and embankments were constructed.

Bombay was obtained by the Portuguese in 1530 from an Indian chief at Salsette; by them it was ceded to Great Britain in 1661, and in 1668 it was transferred to the East India Company. Next to Madras it is the oldest of the British possessions in the East, and from the commencement of the last century has gradually increased in importance.

Bombay Duck. See BUMMALOTI.

Bombazine, derived from *bombyx*, the Greek term for silk and silkworm, is a mixed tissue of silk and worsted, and was long woven both plain and colored. The latter, however, has gone into disuse, and the only color now used is black, for which there is an extensive demand in Spain and South America, where some of the religious orders use it, and it generally forms the material of the almost universally worn Spanish *mantilla*. The manufacture was originally introduced into England by a colony of Dutch or Flemings, who settled in Norfolk, and long continued to have its principal seat at Norwich, the capital of that county, though it is now chiefly confined to Halifax and Kidderminster.

Bombon, Philippines, a large, fresh water lake in the island of Luzon, about 50 miles south of Manila. It is 105 square miles in area. There is a small island in the centre, from which rises the volcano Taal, whose height is only 850 feet. The waters of the lake find an outlet to the sea through the Pansipit River.

Bombproof, a structure intended to resist or repel artillery shot and shell. When designed for permanency they are either of masonry or cut from solid rock, but temporary bombproofs are constructed of earth and timber, or other available material. See also **BLINDAGE**.

Bombycidae, a group of genera comprising some of the largest and most regal of moths. Their thick, heavy bodies and small sunken heads, the mouth parts often obsolete, the tongue either wholly or partly atrophied; the broadly pectinated antennae; the broad, often falcate, wings; and their sluggish habits, afford good characters for distinguishing them. The larvæ are silk-worms, or "spinners." They are often thick, usually more hairy or spiny than those of other groups of moths, or as in the Chinese silk-worm, smooth; while in the large *Attacus atlas*, *Telea polyphemus*, *Samia cecropia* and *Tropæa luna*, the worms are short, fat, fleshy, and sluggish. They spin a more or less dense cocoon of silk to protect the enclosed pupa from sudden changes in the weather. Although the name *Bombycidae* is confined to the small group represented by the silk-worm (*Bombyx mori*), all the typical spinners are referred to as bombycine moths. The most typical families are the *Notodontidae*, *Sphingicampidae*, *Saturniidae*, and *Remileucidae*. Of these the *Sphingicampidae*, however, like the *Sphingidae*, to which they may have given origin, spin no cocoon and transform in the earth, the pupa being subterranean (see also **SILKWORM**). Consult: Packard, 'Monograph of the Bombycine Moths' ('Memoirs of the National Academy of Sciences,' Vol. VII., Washington, 1895).

Bomford, George, American soldier: b. New York, 1780; d. Boston, Mass., 25 March 1848. He graduated at West Point in 1805 and was assigned to the Engineer corps. Between 1805 and 1812 he worked on the fortifications of New York harbor, the defenses of Chesapeake Bay, and was superintending engineer of the works on Governor's Island. During the War of 1812 he was brevetted lieutenant-colonel for distinguished service in the ordnance department. He introduced bomb cannons, made on a pattern of his own invention, which were called Columbiads, a kind of heavy gun combining the qualities of gun, howitzer, and mortar. On 30 May 1832 he was appointed chief of ordnance, and on 1 Feb. 1842 became inspector of arsenals, ordnance, arms, and munitions of war, in which duty he continued until his death. See Cullum, 'Officers and Graduates of the United States Military Academy' (Vol. I. 1868).

Bon Marché, bôn mâr-shâ, one of the large department stores of Paris, situated on the Rue de Bac and Rue de Sèvres. It was founded in 1853 by Aristide Boucicault as a small store in the Rue de Bac and grew little by little to be the great establishment it now is. The present building was begun in 1869, was first used in 1872, and has been enlarged at various times since then. The management is co-operative. Pensions from \$120 to \$300 a year are given to men after the age of 50, and women after 45, and there is a regular system of promotion. It is thought that this organization has contributed largely to the success of the store.

Bona, Giovanni, Italian cardinal: b. Mondovì, Piedmont, 10 Oct. 1609; d. Rome, 27 Oct. 1674. He was renowned for his piety and learning, a collaborator in the 'Acta Sanctorum,' the author of 'Rerum Liturgicarum,' which is an authority on the service of mass, and of 'De principiis vitæ Christianæ,'—a book which has frequently been compared to the 'Imitation of Christ,' and of which a French translation has appeared (1854-5).

Bona Dea, the good goddess, a mysterious divinity of the Roman mythology, the wife or the daughter of Faunus. Her worship was secret, performed only by women; men were even required to ignore her name. Her sanctuary was in a cavern in the Aventine Hill, but her festival, which occurred 1 May, was celebrated in a separate room in the dwelling of the consul who then had the fasces. No man was allowed to be present, and all male statues in the house were covered. The wine used at this festival was called milk, and the vessel in which it was kept, *mellarium*. After the sacrifices, bacchanalian dances were performed. According to Juvenal, licentious abominations marked these festivals. The snake was the symbol of the goddess, and this would point to her being considered as possessing a curative, medical power, and in her sanctuary various herbs were offered for sale. By the Greeks the Bona Dea was identified with Hecate, Semele, or other divinities.

Bona Fide, a technical legal expression, to which the law of Great Britain and this country has annexed a certain idea. It is a term used in statutes in England and in acts of the legislature of all the United States, and signifies a thing done really, with a good faith, without fraud or deceit, or collusion or trust. The words *bona fide* are restrictive, for a debt may be for a valuable consideration and yet not *bona fide*. A debt must be *bona fide* at the time of its commencement or it can never become so afterward. If a contract be made with good faith, subsequent fraudulent acts will not vitiate it, although such acts may raise a presumption of antecedent fraud and thus become a means of proving the want of good faith in making the contract.

Bonacci-Brunamonti, Maria Alinda, mǎ-ē'ā ä-lên'dä bö-nä'chē-broo-nä-môn'tē, Italian poet: b. Perugia, 1842. She was only 14 years old when her first 'Collection of Poems' appeared and attracted much attention. Her 'National Songs' (1850-78) were inspired by Italy's struggle for freedom.

Bonald, Louis Gabriel Ambroise, loo-ē gä-brē-ēl an-brwäz bö-näl (VICOMTE DE, vë-cönt dé), French philosopher: b. 1754; d. 1840. During the Revolution he joined the Royalist army under the Bourbon princes. He returned to France under Napoleon; became co-editor of the *Mercur* with Chateaubriand and Fiévée, and in 1808 was appointed minister of public instruction. After the Restoration,—as the deputy for his department,—he voted with the Ultramontane or Theocratic party in the Chambre Intronvuable, and in his political career, as in his philosophical works, was the ardent advocate of absolutism, of the infallibility of the Pope, and of the Jesuits. In 1830 he refused to take the oath of allegiance to the new dynasty.

BONANNO — BONAPARTE

Bonanno, bō-nān'nō, Italian architect and sculptor. In 1174 he commenced, with Wilhelm of Innsbruck, the famous Leaning Tower of Pisa. He was also the designer of the celebrated bronze doors of the cathedral of that city.

Bonanza, a rich body of ore. See COMSTOCK LOPE.

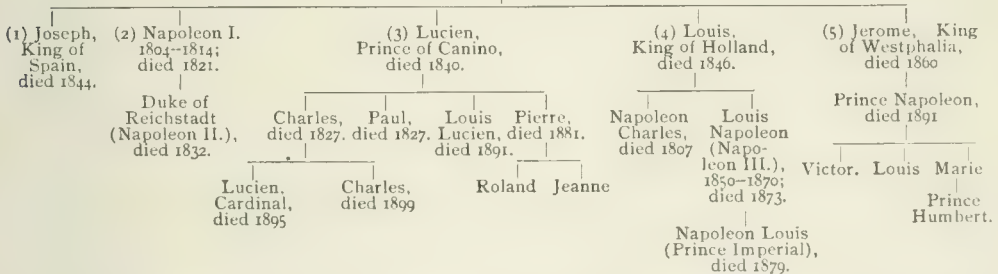

Bonaparte, or **Buonaparte**, the name of a Corsican family — a name now as well known as any in history. It was spelt Buonaparte by the Emperor Napoleon and his father till 1796, though the more usual, modern form also occurs in old Italian documents. Several families are mentioned as early as the 12th century who bore the name of Bonaparte, and who took a position of some prominence in the history of Italy. In 1122, for instance, a Bonaparte was banished from Florence as a Ghibelline. Corrado Bonaparte is mentioned in 1170 and Jacopo Bonaparte in 1210 as knights of the Order of the Golden Spur. The office of *podestà* was held by Nordio Bonaparte in Parma in 1272, by Pietro Bonaparte in Padua 1285, and by Giovanni Bonaparte in Florence 1333. In 1250 a Bonaparte was syndic of Ascoli, and in 1440 Cesare Bonaparte was chosen as head of naval affairs at Sarzana. A

of Ajaccio in the senate of Genoa, and in 1614 Francesco was chosen captain of his native town. In 1757 Joseph, the grandfather of Napoleon I., received a formal patent of nobility from the Grand Duke of Tuscany. About the middle of the 18th century there remained three male representatives of the family of Bonaparte at Ajaccio, the archdeacon Lucien Bonaparte, his brother Napoleon, and their nephew Charles, who became father of the Emperor Napoleon I. and of a numerous family of princes.

Bonaparte, Charles, father of the Emperor Napoleon I. b. Ajaccio, Corsica, 29 March 1746; d. Montpellier, 24 Feb. 1785. He was carefully educated, studied law at Pisa, and soon after his return married without the consent of his relatives Letitia Ramolino, a beautiful patrician. He fought under Paoli for the independence of Corsica, but resistance to the French proving useless he went over to their side. In 1771, when Louis XV. caused 400 Corsican families to be selected who alone were to be considered noble, the Bonaparte family, — and consequently Charles, — was among the number. By the influence of the French governor, Marbœuf, who was very friendly toward the family,

THE BONAPARTE FAMILY (*Male Issue*).

CHARLES BONAPARTE.

Giovanni Bonaparte is said to have married a niece of Pope Nicholas V. in 1404, but this seems doubtful for chronological reasons. It is however certain that about 1454 Niccolo Bonaparte was ambassador of this Pope to several courts, and vicar of the Holy See in Ascoli. Another Niccolo Bonaparte, professor at San Miniato in the 16th century, is stated to have been the author of the comedy 'La Vedova' (Florence 1568); and a work on the Sack of Rome in 1527 is attributed to the Tuscan Giacomo or Jacopo Bonaparte, who was an eyewitness of the event. The connection between these different Bonapartes is by no means well established; yet in 1771 the relationship of the Corsican Bonapartes with the Florentine Bonapartes was judicially recognized. In Corsica itself a Messire Bonaparte appears as witness to an act executed by Berengar II. of Italy as early as 947, and it is therefore not improbable that the family originally emigrated from this island to the mainland, and that a branch of the Genoese line returned to their old home in the 16th century. From the time of Gabriel Bonaparte, who settled at Ajaccio in 1567, and took part in the naval expeditions against the Moors, the Bonapartes ranked as a patrician family of that town. In 1576 Girolamo Bonaparte was elected deputy

he was (1773) named royal councilor and assessor for the town and province of Ajaccio. As a member of the deputation of Corsican nobles sent to the court of France in 1777 he resided several years at Paris, and was fortunate enough to secure a free admission for his eldest son, Joseph, to the seminary at Autun, another for his second son, Napoleon, to the military school of Brienne, and a third for his daughter, Maria Anna, to the educational institution at St. Cyr. He returned to Corsica in 1779, and afterward went to Montpellier for the benefit of his health, but did not recover. By his marriage with Letitia Ramolino he left eight children; Joseph (see BONAPARTE, JOSEPH), king of Spain; Napoleon I., emperor of the French (see NAPOLEON I.); Lucien (see BONAPARTE, LUCIEN), prince of Canino; Maria Anna, afterward called Elise, princess of Lucca and Piombino, and wife of Prince Bacciocchi (see BACCIOCCHI, FELICE PASQUALE); Louis (see BONAPARTE, LOUIS), king of Holland; Carlotta, afterward named Marie Pauline, Princess Borghese (q.v.); Annunciata, afterward called Caroline, wife of Murat (see MURAT), king of Naples; and Jerome (see BONAPARTE, JEROME), king of Westphalia. See also BONAPARTE, LETITIA RAMOLINO; NAPOLEON III.

BONAPARTE

Bonaparte, Jerome, youngest brother of Napoleon: b. Ajaccio, Corsica, 15 Nov. 1784; d. near Paris, 24 June 1860. At an early age he entered the French navy as a midshipman. In 1801 he was sent out on an expedition to the West Indies, but the vessel being chased by English cruisers, was obliged to put in to New York. During his sojourn in America, Jerome Bonaparte became acquainted with Miss Elizabeth Patterson, the daughter of the president of the Bank of Baltimore, and a descendant, as is asserted, of "Old Mortality," immortalized by Sir Walter Scott. His addresses to this young lady having been accepted, they were married 24 Dec. 1803, according to the Roman Catholic ritual, in the cathedral of Baltimore, and in 1805 embarked for Europe. This marriage of his brother did not meet the approval of the Emperor Napoleon, whose ambitious views it thwarted, and he accordingly, after an ineffectual application to Pope Pius VII. to have it dissolved, issued a decree declaring it to be null and void. On 12 Aug. 1807, Jerome was married to Catherine Sophia, Princess of Würtemberg, and a few months afterward was created king of Westphalia, and crowned with great pomp at Cassel, 1 Jan. 1808. His government was not marked by much judiciousness or prudence; little regard was paid to national feelings, and the finances of the state, both from mismanagement and the frequency of hostile incursions, became ere long involved in hopeless embarrassment. The battle of Leipsic put an end to Jerome's reign, and he was obliged to take flight to Paris. On the conclusion of the Treaty of Paris he left France, and proceeded first to Switzerland, thence to Grätz, and in the beginning of 1815 to Trieste. On his brother's return from Elba he again proceeded to Paris, and was nominated a peer of France. At the battles of Ligny and Waterloo he was actively engaged, and displayed considerable bravery, besides receiving a wound in the arm. On Napoleon's overthrow he retired first to Switzerland, then to Würtemberg, and from this period up to the fall of Louis Philippe, in 1848, resided in different parts of Europe under the title of the Comte de Montfort, and latterly chiefly in Florence. On the outbreak of the revolution of February 1848 he returned to Paris, and was appointed (23 December) governor-general of the hospital of the Invalids, and in 1850 a marshal of France. In 1852 he was made president of the Senate. Reference has already been made to the two successive marriages contracted by Jerome Bonaparte. From his union with Miss Patterson only one son proceeded, Jerome (see BONAPARTES OF BALTIMORE). By his second wife Jerome Bonaparte had three children. The elder son, **JEROME BONAPARTE**, b. 1814, d. 1847. **MATHILDE BONAPARTE**, Princess of Montfort (b. Trieste, 27 May 1820), married the Russian Count Anatol Demidoff, and lived at the court of Louis Napoleon during his presidency. The younger son, **NAPOLEON JOSEPH CHARLES PAUL BONAPARTE**, commonly known as **PRINCE NAPOLEON** (b. Trieste, 9 Sept. 1822; d. 18 March 1891), passed his youth in Italy; entered the military service of Würtemberg in 1837; afterward traveled in several countries of Europe; and was banished from France (1845) on account of his intercourse with the Republican party. After February 1848 he was elected to the National Assembly. He commanded an in-

fantry division at the battles of Alma and Inkermann. In 1859 he married the Princess Clotilde, daughter of Victor Emmanuel, by whom he had two sons (see BONAPARTE PRETENDERS), and a daughter. After the fall of the empire he took up his residence in England, but returned to France in 1872. On the death of the Prince Imperial, son of the Emperor Louis Napoleon, in Zululand in 1879, the eldest son of Prince Napoleon became the heir of the Bonapartist hopes. When, in 1886, the chiefs of the Bourbon family were, by a vote of both chambers, expelled from France, Prince Napoleon and his eldest son were exiled also as pretenders to the throne.

Bonaparte, Joseph, eldest brother of Napoleon I.: b. Corte, Corsica; d. Florence, Italy, 28 July 1844. He was educated in France at the college of Autun, returned to Corsica in 1785 on his father's death, studied law, and in 1792 became a member of the new administration of Corsica under Paoli. In 1793, after Paoli had called in English aid, he emigrated to Marseilles, and became brother-in-law to Bernadotte, afterward king of Sweden, by marrying one of the daughters of a wealthy banker named Clari. In 1796 he accompanied the army of Italy as commissary, in 1797 was elected a Corsican deputy to the Council of Five Hundred, and shortly after was sent by the Directory ambassador to the Pope. He returned abruptly, and had not long resumed his seat in the Council of Five Hundred, when his brother having become First Consul he was made councilor of state, and employed to negotiate a treaty with the United States. Shortly after, in 1801, he negotiated the peace of Luneville with the emperor of Germany, and in 1802 that of Amiens with Great Britain. Napoleon having now begun to deal out kingdoms among his family, Joseph was made king of Naples and Sicily in 1806, but had reigned only two years when his brother recalled him, and sent him to Madrid to be king of Spain and the Indies. His seat at Naples had not been comfortable, and he now found himself on a bed of thorns. His kingship lasted nominally for five years, but he was chased once and again from his capital, and the third time, in 1813, fled not to return. In these appointments Joseph was merely a tool in his brother's hands. In 1814, after the fatal expedition to Russia, Napoleon on setting out for the army made him lieutenant-general of the empire, and head of the council of regency. This was his last office of any consequence. After the battle of Waterloo he sailed for the United States and lived for some years at Bordentown, N. J., where he employed himself in agriculture, and was highly esteemed by his neighbors. During his exile he assumed the title of Count de Survilliers. In 1832 he went to England and after residing there for some time repaired to Italy, and spent his closing days in Florence. His wife appears to have been prevented by ill health from accompanying him to the United States. She survived her husband but a few months. There were two daughters. The eldest became the wife of the eldest son of Lucien Bonaparte, and the second was married to the second son of Louis Bonaparte.

Bonaparte, Letitia Ramolino, mother of Napoleon, and hence known by the name of **MADAME MÈRE**: b. Ajaccio, Corsica, 24 Aug.

BONAPARTE

1750; d. Rome, 2 Feb. 1836. She was married in 1767 to Charles Bonaparte (see BONAPARTE, CHARLES). Left a widow in 1785, she continued to reside in Corsica till 1793, when she removed to Marseilles. In this city she lived in straitened circumstances. After her son became First Consul, she fixed her residence at Paris, had a separate establishment assigned to her, and lived in considerable state, though somewhat retired. All things considered, she conducted herself with great discretion, performing her part becomingly in the station to which she had been so unexpectedly elevated, and yet never allowing herself to forget that in the necessary course of events the sudden rise of her family might one day be terminated by an equally sudden fall. When the fall came she retired to Rome, and collecting most of the surviving members of her family around her, lived to the very advanced age of 86.

Bonaparte, Louis (COUNT OF ST. LEU), second younger brother of the Emperor Napoleon I., and father of Napoleon III.: b. Ajaccio, Corsica, 2 Sept. 1778; d. Leghorn, Italy, 25 July 1846. He was educated in the artillery school at Chalons, accompanied Napoleon to Italy, and afterward to Egypt, but without distinguishing himself in any special manner. He subsequently rose to the rank of a brigadier-general, and in 1802 married Hortense Eugénie Beauharnais, Napoleon's step-daughter (see BEAUHARNAIS, HORTENSE EUGÉNIE). In 1806, on Schimmelpenninck, grand pensionary of Holland, demitting his office, Louis Bonaparte was compelled by his brother, notwithstanding his protestations, to accept the Dutch crown. The difficult situation in which he was placed rendered it impossible for him to be anything else than a mere viceroy of Napoleon; but to his credit it must be recorded that he exerted himself to the utmost in promoting the welfare of his new subjects, and resisted as far as in him lay the tyrannical interference and arbitrary procedure of France. With all his efforts, however, he found himself unable to restore the finances of the country to a healthy condition: a quarrel took place between him and his brother relative to the continental system maintained by the latter, which had proved most injurious to Dutch commerce, and he ultimately, on 1 June 1810, abdicated the sovereignty, and retired to Grätz under the title of the Count of St. Leu. Holland was thereupon annexed to France. In 1814 Louis paid a visit to Paris, and strongly counseled his brother to make peace with the allies. After the Restoration he took up his abode at Rome, and separated himself from his wife, Hortense, a disunion which continued throughout his life. In 1826 he removed from Rome to Florence, and from thence, a short time after his son's escape from the fortress of Ham, to Leghorn, where his literary abilities were considerable, and he was the author of a novel entitled '*Marie, les Peines de l'Amour ou les Hollandaises*'; and '*Documents historiques et Réflexions sur le Gouvernement de la Hollande*'; etc.

Bonaparte, Lucien (PRINCE OF CANINO), next younger brother of Napoleon I.: b. Ajaccio, Corsica, 21 March 1775; d. Viterbo, Italy, 29 June 1840. He emigrated to Marseilles in 1793, and made himself conspicuous as a hot-headed Republican by addressing clubs, and publishing

bombastic pamphlets. Shortly after, having been appointed to a situation in the commissariat at the small town of St. Maximin in Provence, he married the innkeeper's daughter. He made a narrow escape during the Reign of Terror, and in 1796 was appointed commissary at war, and on his election as a member of the Council of Five Hundred, took up his residence in Paris. He joined the opposition in the council, and seconded Sieyès and his party, who wished to frame a new constitution. He is said to have written to his brother in Egypt complaining of the incapacity of the executive Directory, and urging his return; and in 1799, when the council wished to outlaw Napoleon, Lucien, who was president, after manfully resisting the motion, slipped quietly out of the chair in the confusion, and sent in the soldiers, who cleared the hall. The revolution thus mainly accomplished by his decisive procedure led to the establishment of the consular government, and Lucien was a member of the commission which framed its constitution. Afterward appointed minister of the interior, he was active in the encouragement of education, art, and science, and organized the prefectures. As ambassador to Madrid (1800) he contrived to gain the confidence of King Charles IV. and his favorite, Godoy, and to undermine the British influence, which had until then been exercised at the court of Spain. On his return to Paris in 1802 he was member of the tribunate, and then a senator, and having lost his first wife, married a stockbroker's widow. This marriage, and other concurring causes, appear to have given deep offense to Napoleon, and in the enactment fixing the succession to the crown, while Joseph and Louis were named eventual heirs, Lucien and Jerome were not mentioned. The crowns of Italy and Spain were offered Lucien on condition of his divorcing his wife, but he refused them and chose a retired life, devoting himself to art and science. He fixed his residence at Rome, where he appears to have gained the good graces of Pius VII., who created him, in 1814, Prince of Canino. During Napoleon's haughty treatment of the Pope, Lucien had freely expressed his displeasure, and apparently despairing of a reconciliation with his brother, or perhaps not caring to ask it, he embarked for the United States in 1810, but had not proceeded far when he was captured by a British cruiser and carried to Malta. Ultimately he was brought to England, and allowed to reside on parole at a place in the vicinity of Ludlow Castle. Here he employed much of his time in writing a poem entitled '*Charlemagne ou l'Église Sauvée*,' which he afterward published with a dedication to Pius VII. After the battle of Waterloo his brother appointed him his extraordinary commissioner to the chamber of deputies. He showed no lack of zeal in endeavoring to arouse a feeling of sympathy, but found the attempt vain, and left matters to take their course. He afterward returned to Italy. Besides the poem '*Charlemagne*,' which has been translated into English, and published in 2 volumes 4to, he wrote another, called '*La Cynéide ou la Corse Sauvée*,' and an autobiography, which, under the title of '*Mémoires*,' was published during his lifetime.

By his first wife, Lucien had two daughters; by his second, nine children. His eldest son, CHARLES LUCIEN JULES LAURENT BONAPARTE, Prince of Canino and Musignano: b. Paris, 24

BONAPARTE PRETENDERS—BONAPARTES OF BALTIMORE

May 1803; d. 29 July 1857, achieved a considerable reputation as a naturalist, chiefly in ornithology. He published a continuation of Wilson's 'Ornithology of America' (1825-33); the 'Iconografia della Fauna Italica' (1832-41); his *chef d'œuvre*; 'Catalogo Metodico degli Uccelli Europei' (1842); 'Catalogo Metodico dei Pesci Europei' (1845); 'Ornithologie Fossile' (1858); and a number of other valuable works on zoology, and was a member of the leading natural history societies in Europe and America. During the later years of his life he took a prominent part in Italian affairs as a supporter of the Liberal party. PAUL MARIE BONAPARTE, the second son, b. 1808, took a part in the Greek war of liberation, and died by the accidental discharge of a pistol in 1827. The third son, LOUIS LUCIEN BONAPARTE (b. Thorn Grove, England, 1813; d. 1891), early devoted himself with equal ardor to chemistry, mineralogy, and the study of languages, and became an authority of the first rank in Basque, Celtic, and comparative philology generally. His election for Corsica in 1848 was annulled, but he was sent to the Constituent Assembly for the Seine department next year, and was made senator in 1852, with the title of highness in addition to that of prince, which he already possessed from his birth. The total number of separate books written either by himself or at his instigation and encouragement, amounted to no less than 222. Among these are a translation of St. Matthew's version of the parable of the sower into 72 languages and dialects of Europe (1857); a linguistic map of the seven Basque provinces, showing the delimitation of the "Euscara," and its division into dialects, sub-dialects, and varieties (1863); a Basque version of the Bible in the Labourdin dialect (1865); a treatise on the Basque verb (1869); besides many papers of profound learning in the philological journals. A great work produced under his patronage from 1858 to 1860, was a version of the Song of Solomon in 22 different English dialects, besides four in Lowland Scotch, and one in Saxon. He lived long in England, where a Civil List pension of \$1,250 was granted to him in 1883. The fourth son, PIERRE NAPOLEON BONAPARTE (1815-83), passed through many changes of fortune in America, Italy, and Belgium, and returned to France in 1848. In 1870 he shot a journalist, Victor Noir, a deed which created great excitement in Paris; and, being tried, was acquitted of the charge of murder, but condemned to pay \$5,000 to Victor Noir's relatives. He died in 1881. The youngest son, ANTOINE BONAPARTE (b. 1816), fled to the United States after an affair with the papal troops in 1836, and returned to France in 1848, where he was elected to the National Assembly in 1849.

Bonaparte Pretenders. Of the Emperor Napoleon I. and his brothers, Joseph and Louis, male issue is now extinct. The emperor's brothers, Lucien and Jerome, are represented by the following living descendants, and they constitute the present imperialist house of France:

PRINCE VICTOR NAPOLEON (of the house of Jerome): b. 18 July 1862, is the son of the late Prince Napoleon and the Princess Clotilde, sister of King Humbert of Italy. The Prince has been recognized by his party as the undisputed head of the Bonaparte family. He lives in Brussels and is unmarried. His only brother,

Prince Louis Napoleon, born in 1864, is an officer in the Russian army. His sister, born in 1866, is the widow of Prince Amadeus of Italy, by whom she had a son, Prince Humbert, born in 1889.

PRINCE CHARLES NAPOLEON, brother of the late Cardinal Bonaparte, who died 12 Feb. 1899, was the last representative of the eldest son of Napoleon's brother, Lucien, in the male line. He was born in 1839; was married and had two daughters—Marie, wife of Lieut. Giotti, of the Italian army, and Eugénie, unmarried. He had three sisters, married, respectively, to the Marquis of Roccagivoino, Count Primoli, and Prince Gabrelli.

PRINCE ROLAND BONAPARTE is the only living male cousin of Prince Charles Napoleon. He is a son of the late Prince Pierre Napoleon Bonaparte (1815-81); was born in 1858; married in 1880, the daughter of Blanc, the proprietor of the Monte Carlo gambling establishment. His wife died in 1882, leaving him a daughter and a fortune. He has one sister, Jeanne, born in 1861, and married to the Marquis de Villeneuve.

Bonapartes of Baltimore, the branch of the family residing in Baltimore, Md., and derived from the marriage of Jerome Bonaparte, brother of the Emperor Napoleon I., with Elizabeth Patterson, daughter of William Patterson, an eminent merchant in the city of Baltimore. Elizabeth was born 6 Feb. 1785, and was scarce 18 years of age, when Jerome Bonaparte in command of a French frigate landed in New York in 1803. She, at that time, was distinguished by uncommon personal beauty, and is said, moreover, to have strikingly resembled the Bonaparte family. The fame of Napoleon insured for his brother Jerome a distinguished reception in America, and wherever he went he was most hospitably entertained. On visiting Baltimore he saw Miss Patterson, and soon became much attached to her, a partiality which she readily returned, and being ambitious in her views of life, she at once accepted his offer of marriage, and was united to him 24 Dec. 1803. The marriage ceremony was performed by the bishop of Baltimore, John Carroll, brother of Charles Carroll of Carrollton, the signer of the Declaration of Independence, and in accordance with the ritual of the Roman Catholic Church. The marriage contract, considered of importance, was drawn up by Alexander J. Dallas, subsequently secretary of the treasury, and witnessed by several official personages, including the mayor of Baltimore. Jerome Bonaparte remained in America for a full year, visiting, with his wife, various parts of the country. They embarked for Europe in the spring of 1805, in the American ship *Erin*, and arrived safely at Lisbon. The news of the marriage proved very distasteful to the dictator of France, partly because Jerome had dared to marry without his consent, and partly on account of his own wish to unite all his brothers to European princesses. Before the newly wedded pair could reach Europe, an order went forth to every port under French authority, forbidding them to land. The hopes of the fair American were now forever blighted, as Napoleon sternly refused to recognize her marriage. Jerome left her at Lisbon, and hastened to Paris, hoping by a personal interview to soften the emperor, directing the vessel to proceed to Amsterdam, as the state of his wife's health would

not admit of her undergoing a long land journey, even if a passport could be obtained for her, which was very doubtful. On the Erin's arrival at Texel roads, Madame Bonaparte found that an order had been awaiting her coming, which prohibited her from landing. She was obliged to sail at once for England, where she established her abode, and at Camberwell, near London, gave birth to a son. She never saw her husband again, except in a casual meeting many years after their separation. Jerome, who was originally much attached to his wife, in vain petitioned the emperor to recognize her, and was finally obliged to marry the Princess of Würtemberg. After the downfall of Napoleon, Madame Patterson (as she was styled for a long period) visited Europe, and is said to have encountered Jerome Bonaparte with his wife in the gallery of the Pitti palace in Florence. On meeting, Jerome started aside, and was overheard to say to the princess: "That lady is my former wife." He instantly left the gallery, and next morning departed from Florence. Napoleon I. never succeeded in inducing Pope Pius VII. to declare Jerome's first marriage null and void. Madame Bonaparte, after the birth of her son, generally resided in Baltimore, in the possession of abundant wealth. Notwithstanding her treatment by Napoleon, she always expressed the highest admiration for him, and prophesied that her grandson would eventually succeed him as emperor of the French. JEROME NAPOLEON, son of the preceding: b. Camberwell, England, 7 July 1805; d. Baltimore, 17 June 1870. His mother returned to the United States during his boyhood, and he was raised in Baltimore. He entered Harvard College, and graduated from that institution in 1826. He studied for the bar, but never practised law. He was married to Miss Susan Mary Williams, daughter of Benjamin Williams, originally of Roxbury, Mass. Miss Williams was a lady of very large fortune, which, united with Bonaparte's own property, made him one of the wealthiest citizens of Baltimore. After his marriage he devoted his time to the management of a large estate, and partly to agricultural pursuits. For many years, Bonaparte received a handsome allowance from his father, with whom he was on terms of intimacy in his several visits to Europe. During the reign of Louis Philippe, Bonaparte was permitted to sojourn in Paris, but for a short period only, and under his mother's name of Patterson. Although traveling *incognito*, he attracted much attention from his singular likeness to the great emperor. He was thought to resemble him more than any of the monarch's own brothers did. He was on good terms with Napoleon III., and visited the French court with his son, by the invitation of the emperor. Bonaparte tested his legal standing in the French courts by lodging a claim to share with the offspring of the second marriage, in the property of his father; but judgment was given against him. JEROME NAPOLEON, grandson of Jerome Bonaparte: b. Baltimore, 5 Nov. 1832; d. Pride's Crossing, Mass., 4 Sept. 1893. He was educated at Harvard College and West Point Military Academy, but resigned his commission in the United States army to enter the French service in 1854. He served with distinction in the Crimean war and in the Italian campaign. CHARLES JOSEPH, grandson of Jerome Bonaparte: b. Baltimore, 9 June 1851.

He was graduated from Harvard University in 1871 and the Harvard law school in 1874. He has been active in political reform movements. In 1904 he was appointed a member of the Board of Indian Commissioners. In 1905 he was appointed Secretary of the Navy by President Roosevelt.

Bonar, Horatius, Scotch hymnist: b. Edinburgh, 19 Dec. 1808; d. 31 July 1889. He wrote 'Hymns of Faith and Hope,' many of which have been taken into the hymnals of most of the Protestant churches. He also wrote more than 20 volumes on theological and religious subjects.

Bonasone, Giulio, jool'ë-ō bō-nā-sō'nā, Italian painter: b. Bologna, 1510; d. 1574. He studied under Marcantonio Raimondi, but did not equal his master in execution. Although best known by his engravings, which reproduce the works of Raphael, Michael Angelo, and Guilio Romano, specimens of his paintings are to be found in the churches of his native city.

Bonasus, a species of wild ox, the aurochs (q.v.).

Bonaven'ture, Saint (properly JOHN OF FIDANZA), Italian philosopher: b. Tuscany, 1221; d. 1274. In 1243 (or 1248) he became a Franciscan monk; in 1253 teacher of theology at Paris, where he had studied; in 1256, general of his order, which he ruled with a prudent mixture of gentleness and firmness. At the time of his death he was a cardinal and papal legate at the Council of Lyons. His death was hastened by his ascetic severities. On account of his blameless conduct from his earliest youth, and of some miracles ascribed to him, he enjoyed during his life the greatest veneration, and was canonized by Pope Sixtus IV. The elevation of thought in his writings procured him the name of "The Seraphic Doctor." The Franciscans oppose him as their hero to the Dominican scholastic Thomas Aquinas. He wrote for the honor and improvement of his order, for the promotion of the worship of the Virgin, on celibacy, transubstantiation, and other doctrines. He is, on the whole, distinguished from other scholastics by perspicuity, avoidance of useless subtleties, and greater warmth of religious feeling. Among his writings are 'Itinerarium Mentis in Deum'; 'Reductio Artium in Theologiam'; 'Centiloquium'; and 'Breviloquium.' His whole works were published 1588-96, at Rome, in 7 folio volumes, and there are several modern editions. Many pieces attributed to him are not genuine.

Bonavis'ta, Newfoundland, the name of a bay, cape, district, and town on the east coast of the island. The greatest width of the bay is 39 miles. Its navigation is rendered dangerous by the rocky islands with which it is studded. There is a lighthouse at the entrance of the harbor. The town stands near the cape, about 70 miles north by west of St. John's, and is a port of entry and fishing station. Pop. 3,551.

Bon'bright, Daniel, American educator: b. Youngstown, Pa., 1831. He graduated at Yale (1850), and was tutor there (1854-6). Between 1856 and 1858 he studied at the universities of Berlin, Bonn, and Göttingen, and upon his return to America became professor of the Latin language and literature in Northwestern University, Evanston, Ill. From 1899-92 he was dean of the faculty of liberal arts. During 1900-2 he was acting president of the university.

Bonchamp, Charles Melchoir Artus, shārl mēl-kē-or ār-tū bōn-shān (MARQUIS DE, mār-kē-dē), Vendean leader: b. Anjou, 10 May 1760; d. 17 Oct. 1793. He served as a volunteer in the American Revolutionary War, and was a captain in the French army at the outbreak of the French Revolution. A strong Royalist, he naturally disliked the Revolution, and consequently lived in retirement until chosen leader of the Anjou insurgents. In conjunction with La Rochejacquelein and Cathelineau he fought with great bravery and frequent success, but his superior knowledge of military tactics was not sufficiently made use of by the insurgent army. In the encounter at Cholet, 17 Oct. 1793, Bonchamp received a fatal shot in the breast, and when his followers vowed to revenge his death on 5,000 Republican prisoners, the dying hero exclaimed: "Spare your prisoners. I command it!" This last command was obeyed.

Bond, (Sir) Edward Augustus, English scholar: b. Hanwell, 1815. In 1867 he was placed over one of the departments of the British Museum, and in 1878 became head librarian, retaining the post for 10 years. He was one of the founders and for many years the president of the Paleontological Society, editing in this connection 'Facsimiles of Ancient Manuscripts.' Among other works edited by him are 'Statutes of the Colleges of Oxford,' and 'Travels of Jerome Horsey.'

Bond, George Phillips, American astronomer (son of William Cranch Bond (q.v.)): b. Dorchester, Mass., 20 May 1825; d. 17 Feb. 1865. He assisted his father in the Harvard College Observatory, and at the time of the latter's death was appointed director. He discovered independently 11 new comets, and was the author of an elaborate memoir on the appearance of Donati's comet in 1858, and of important investigations on the subject of perturbations of cometary orbits, as well as an investigation into the theory of the constitution of Saturn's rings. His drawing of the nebula in Orion, of which a fine steel-plate engraving was made, was also remarkable work, and astronomical photography received its first impulse at his hands.

Bond, William Cranch, American astronomer: b. Portland, Me., 9 Sept. 1789; d. 29 Jan. 1859. He began life as a watchmaker, and constructed the first ship's chronometer made in the United States. He established a private observatory at Dorchester, Mass., which was at the time the finest in the country. Invited to move his observatory to Cambridge, he accepted the invitation of the Harvard College authorities, and in 1840 was appointed astronomical observer to the college, and later to the directorship of the observatory erected there in 1843-4. He was the inventor of the method of registering the beats of a clock by galvanic circuit, together with the observed transits of stars over the wires of a transit instrument, upon a chronograph, and he invented the spring governor, in which part of a train of clockwork is regulated by a pendulum with a dead-beat escapement, and the other, receiving its motion through an elastic axis, is made to run uniformly by a balance- or fly-wheel, and thus time is visibly measured to a small fraction of a second. The plan of recording observations by electro-magnetism, known in Europe as the American method, was first

brought into practical working by Sears C. Walker, through Bond's assistance.

Bond. See BUILDING; MASONRY.

Bond, a written acknowledgment or binding of a debt under seal. The person who gives the bond is called the obligor, and he to whom it is given the obligee. A bond may be single, as where the obligor obliges himself, his heirs, executors, and administrators, to pay a certain sum of money to another at a day named, or it may be conditional (which is the kind more generally used) that if the obligor does some particular act, the obligation shall be void, or else shall remain in full force, as payment of rent, performance of covenants in a deed, or repayment of a principal sum of money borrowed of the obligee with interest, which principal sum is usually half of the penal sum specified in the bond. There must be proper parties, and no person can take the benefit of a bond, except the parties named therein, except, perhaps, in some cases of bonds given for the performance of their duties by certain classes of public officers. A man cannot be bound to himself even in connection with others. The bond must be in writing and sealed, but a sealing sufficient where the bond is made is held sufficient though it might be an insufficient sealing if it had been made where it is sued on. It must be delivered by the party whose bond it is to the other. But the delivery and acceptance may be by attorney. The date is not considered of the substance of a bond, and therefore a bond which has either no date or an impossible date is still valid, provided the real day of its being dated or given can be proven. The condition is a vital part of a conditional bond, and usually limits and determines the amount to be paid in case of a breach, but interest and costs may be added (12 Johns. 350). The recovery against a surety in a bond for the payment of money is not limited to the penalty, but may exceed so far as necessary to include interest from the time of the breach. So far as interest is payable by the terms of the contract, and until default made, it is limited by the penalty, but after breach it is recoverable, not on the ground of contract, but as damages, which the law gives for its violation. On the forfeiture of the bond, or its becoming single, the whole penalty was formerly recoverable at law, but here the courts of equity interfered, and would not permit a man to take more than in conscience he ought, that is, his principal, interest and expenses in case the forfeiture accrued by non-payment of money borrowed, the damages sustained upon non-performance of covenants, etc. And the similar practice having gained some footing in the courts of law, the statute of 4 and 5 Anne, C. 16, at length enacted, in the same spirit of equity, that in case of a bond conditioned for the payment of money, the payment or tender of the principal sum due with interest and costs, even though the bond were forfeited and a suit commenced thereon, should be a full satisfaction and discharge. (2 Bl. Com. 340.) If in a bond the obligor binds himself without adding his heirs, executors, and administrators, the executors and administrators are bound, but not the heir (Sheppard's Touchstone, 369) for the law will not imply the obligation upon the heir. (Coi. e,

Litt. 209a.) If a bond lie dormant for 20 years it cannot afterward be recovered; for the law raises a presumption of its having been paid, and the defendant may plead *solvit ad diem* to an action upon it. (1 Burr. 434; 4 Burr. 1963.)

Bondage. See VILLENAGE.

Bonded Warehouse, a place where taxable imports of manufactures may be left in government custody, under bond for payment of the duty, till the importer or manufacturer is prepared to make full payment of duty. The system was designed to promote commerce and certain manufactures by lessening the pressure on the importer or manufacturer by means of instalment payments of duty.

Bonders, a class of independent landholders in Norway and Sweden. They are at once peasants and aristocrats, being descended from the old leaders, and sometimes from the princes, of the nation, yet being also cultivators of the soil, and more rude than the farmers of America or the yeomen of England. They number seven ninths of the whole population, and are the principal electors of representatives to the National Assembly, in which their power predominates over that of the nobles and clergy.

Bondi, bōn'dē, Clement, Italian poet: b. Mizzano, Parma, 27 June 1742; d. Vienna, 20 June 1821. Joining the Jesuits shortly before the suppression of the order in Italy, he was appointed professor of eloquence in the University of Parma. He afterward provoked the hostility of the order by publishing an ode in praise of their suppression, and was obliged to seek an asylum in the Tyrol, where the Archduke Ferdinand took him under his protection, appointed him his librarian at Brünn, and entrusted him with the education of his sons, one of whom afterward succeeded to the duchy of Modena. In 1816 Bondi was appointed professor of history and literature at Vienna, and died there. He was an easy and elegant versifier, and cultivated with success almost all the varieties of poetry—lyric, didactic, satirical, and elegiac. Among the most important are 'La Giornata Villereccia,' 'La Conversazione,' and 'La Felicità.' He also executed a metrical version of the *Æneid*, which some consider his best work.

Bondman, The, one of Hall Caine's best-known romances, abounding in action and variety. The action turns upon the blind attempts of a young man at doing new wrongs to revenge old ones, which are overruled by Providence for good; and at the last, no longer against his will but by the development of his own nature, he fulfills his destiny of blessing those he has sworn to undo.

Bondu, bōn-doo, a country of West Africa, belonging to the French territory of Senegal, on the west of the Falmé, a tributary of that river. Its length is about 115 miles, its breadth about 100. Its surface is but little diversified, and the land as a whole is not very fertile, nor is the climate good. The ordinary African animals occur, but the lion is becoming scarce. The ass is the chief domestic animal. The population, which consists of Fulahs and other tribes, is rather sparse, having been reduced by

frequent wars, but under French rule is beginning to increase. Agriculture, manufactures, and commerce are alike unimportant.

Bone, or Bona (the *APHRODISIUM* of Ptolemy), a seaport of Algeria, province of and 86 miles north-northeast of Constantine. Pop. (1896) 34,498, among whom there are about 12,000 French and 10,000 Italians. It is built at the foot of a hill, and is surrounded by a wall nearly two miles in circumference. It is the seat of French judicial courts. The streets are narrow and crooked, but many of the houses are substantial and well built, and the town has been greatly improved since it came into the hands of the French in 1832. It possesses a college, schools, Roman Catholic cathedral, a convent of the Sisters of Mercy, hospital, etc. There is a good market, and also reading-rooms, coffee-houses, and a theatre. The chief manufactures are burnouses, tapestry, and saddles. It exports corn, iron ore, alfalfa, wine, wool, hides, wax, oil, honey, etc.; and its trade is considerable. There is regular steamboat communication between Bona and Marseilles. About one mile south of the town are the remains of Hippo Regius.

Bone, the compact hard material making up the skeleton of mammals, most of the birds, reptiles, and amphibians, and the bony fishes. It is also found in some lower forms. Chemically bone is complex. It is essentially organic substances, 30 to 35 per cent infiltrated with inorganic mineral salts, 65 to 70 per cent; to the former its toughness is due and to the latter its hardness. The organic substances of bone are ossein (collagen, gelatin), small quantities of elastin, proteids and nuclein from the cells and small quantities of fat. The inorganic salts are calcium carbonate, calcium phosphate, calcium fluoride, magnesium phosphate, calcium chloride, and small quantities of sulphates and other chlorides. The percentages of both inorganic and organic constituents vary widely in the bones of different animals, and also in the different bones of the same animal. These differences vary widely if the age varies, but are fairly constant for the same animal of the same age. Thus the amount of water may vary from 13 to 45 per cent in the different bones of the human body, being greater in amount in the spongy bones and less in the compact bones, and as the bones grow older the percentage of water diminishes. In the living body many of the bones, particularly the ribs, and the heads of all the long bones, contain a substance termed marrow. This is an important substance in the human economy, being the source of much of the blood-building material. In soups this marrow makes one of the most important factors. This bone marrow is pervaded by a network of white fibrous connective tissue and in the meshes are contained the cells, myeloplaxes, that make many of the blood corpuscles, particularly the polymorph neutrophils, and the eosinophiles. In the red marrow the red corpuscles are developed. The bone marrow is very rich in proteids, nucleo-proteids, extractives, globulins, fats, and compounds of iron. Prepared bone marrows are therefore highly nutritious, and the modern "grilled bone," which is usually rich in marrow, is a toothsome and valuable dietary addition. The histological structure of bone is very intricate;

BONE BLACK

in the young developing animal, cartilage first makes its appearance from modified connective tissue cells. In this cartilage certain points of ossification appear, which subsequently develop bone and the bone from several points coalesces to make the completed bone structure. The bone cells in the cartilage, the osteoblasts, thicken and form a distinct cell wall in which the inorganic salts are deposited and osteoblast by osteoblast the structure of bone is made up. Bone is also formed by the periosteum, which is a covering, first of the cartilage and then of the developing bone. Bony tissue contains arteries, veins, nerves, and lymphatics, and is a distinct tissue, largely modified by the deposition of mineral salts. In a section across a long bone, at its centre, say the thigh bone, femur, there is on the outside the thin tough layer, the periosteum with its vessels and nerves and lymphatics; within this is the compact bone and in the centre the cavity usually filled with marrow at the ends. A very thin section of the compact bone viewed under the microscope shows a number of cavities, the Haversian canals; these contain blood vessels or were the sites of former blood vessels in the developmental stage. Around these Haversian canals, one sees regular lamellæ, not unlike the rings about a tree trunk; these are the Haversian lamellæ and indicate the regular growth of bone cells from the centre. Scattered between the lamellæ are numerous small spaces, containing living bone cells, the lacunæ, all of which are probably in communication with one another by minute canals, or canaliculi. Thus the entire bony system is pierced throughout by an extremely fine and exceedingly rich network of canals. As these are filled with lymph the bone substance is constantly bathed in this living life-giving fluid. The different bones of the body show minor variations in structure. The bones of the human body are grouped according to their shape, as long bones, flat bones, short, and irregular bones. They approach one another at the joints, where they are protected by cartilages, smooth synovial membrane, and bathed in a synovial fluid. The long bones consist of a shaft and two expanded ends or epiphyses, and are found in the limbs. They give support and leverage for motion and are usually slightly curved in one or two directions to give greater elasticity. Flat bones are found in the skull, pelvis, scapula, and are usually so disposed as to afford protection to the internal viscera; they also offer considerable surface for muscular attachment and hence give a good leverage for the long bones. Short bones are found in the wrist and ankle. Strength and freedom of motion are their attributes. Irregular and mixed bones, are the vertebrae and some of the bones of the skull. They each have varied and specially adaptive functions. Many bones, especially those of the skull, are composite. They develop separately, and finally unite. Thus the bones of the skull are separated until late in life, and in some individuals, some of the bones never develop thoroughly. This is frequently the case in the growth of the lower jaw, where failure to unite produces the well-known deformity of cleft palate or hare lip.

Bone is slightly heavier than water, its specific gravity varying from 1.80 to 1.90. The spongy bones, because of the large amount of

air contained, float in water. The bones of birds are remarkable for their strength and lightness. The twofold nature of bones is readily demonstrated by two simple experiments. If one bone is placed in acid, 20 per cent hydrochloric, the acid will attack and dissolve out the mineral salts, after which the bone may be bent and its shape altered at pleasure, nothing but the organic material remains; another similar bone may be placed in a furnace and the heat will burn out the organic matter entirely; that which remains will be the mineral matter. It will retain the shape of the original bone, will be white, but will break down into powder at the least pressure.

Uses of the Bones.—In dietetics bones make a substratum for soups. These are important carriers of salts to the body. As for the gelatine alone, it is a tissue sparer, the body can not use it for purposes of anabolism, but it spares katabolism of proteids. It is a useful menstruum for foodstuffs. Bone marrow is highly nutritious, contains iron, and is a superlative food, and thought to be particularly valuable as a blood maker. The uses of bone in the arts are numerous. (See FERTILIZERS.) Consult Syminowitch, 'Histology'; Gray, 'Anatomy.' See ANATOMY; KINETOGENESIS; OSTEOLOGY.

Bone Black, Ivory Black, or Animal Charcoal, the black carbonaceous substance into which bones are converted by calcination or destructive distillation in close vessels, and which is extensively used in the process of sugar-refining. This application of it is due to the property which it possesses in common with other kinds of charcoal, but in a superior degree, of depriving various kinds of solutions, syrups, etc., of their coloring matters, and thus blanching or purifying them. Animal charcoal is prepared either by heating the bones in a retort similar to that in which the coal is decomposed in gas-works, or, which is the better plan, in small cast-iron pots piled up in a kiln. The pots are placed above each other with their mouths in contact, the mouths being luted together with loam. Two of the pots together hold about 50 pounds of bones, which should previously be freed of all fatty, fleshy, and tendinous matters, as the quality of the charcoal is in this case improved. The bones lose, on the average, about half their weight in the process of calcination. The charcoal is ground between grooved rollers in order to prevent the formation of dust, and by this means it is reduced to the condition of coarse grains varying from the size of turnip-seed to that of peas. Liquids are decolorized by passing them through a filter or bed of thin granular charcoal, which absorbs by mechanical action the coloring matters held in solution. The filtering beds used in sugar-refining are sometimes of the depth of 50 feet. After the liquor has flowed for a certain time the charcoal becomes completely saturated, and its purifying action ceases. It has then to be restored so that it may be used again, and this is effected by various means, such as washing with water or with weak hydrochloric acid, long exposure to air and moisture, or heating to redness. The last is the best method, and is the one almost invariably adopted, the charcoal being heated in iron pipes, fire-clay chambers, or in rotating cylinders. See CHARCOAL, ANIMAL.

BONE-CAVES — BONHAM

Bone-caves, caverns containing deposits in which are embedded large quantities of the bones of animals (many of them extinct), dating from the Pleiocene or later geologic periods. See CAVE.

Bone Diseases. See OSTEOMYELITIS; PERIOSTITIS; OSTEITIS.

Bone-dog. See BONE-SHARK; DOGFISH.

Bone-dust, bones ground to dust to be used as manure. See FERTILIZERS.

Bone-fish. See LADY-FISH.

Bone-shark, or **Basking-shark**, a comparatively rare species of pelagic shark, found in the Arctic seas, and southward as far as Portugal and New York. It obtains the name "bone-shark" from the resemblance of its slender, long and close-set gill-rakers to whale-bone. It is also known as "basking-shark," because of its habit of remaining quiet for hours in one place. It reaches a length of 40 feet, and its skin is rough and covered with small spikes. It is usually seen in the brooding season, sluggishly swimming in groups, on the surface of the water, and undisturbed by the approach of boats.

Bonebreaker, the great fulmar-petrel (*Ossifraga gigantea*) of the islands and coasts of the South Pacific and Atlantic oceans. It is as large as an albatross, and feeds mainly upon the carcasses of dead seals and cetaceans, whose bones it is capable of breaking with its vulture-like beak.

Boner, John Henry, American poet and literary worker: b. Salem, N. C., 31 Jan. 1845. A contributor to the magazines, he was on the editorial staff of the 'Century Dictionary' and the 'Standard Dictionary,' and was at one period literary editor of the New York *World*. He has written 'Whispering Pines' (1883), a volume of verse.

Boner, Ulrich, ool'rih bō'nēr, the most ancient German fabulist, a Dominican friar at Bern, in the first half of the 14th century. His collection of fables under the title 'Der Edelstein' (the Gem), is distinguished by purity of language and picturesque simplicity of description. The first editions of these fables were by Bodmer and Eschenburg. Benecke published a very good edition with explanatory notes and an excellent vocabulary (1816); that of Pfeiffer appeared in 1844, and a recent imprint is found in Reclam's 'Universal Bibliothek' (1895).

Boneset, or **Thoroughwort** (*Eupatorium perfoliatum*), a stout, ill-smelling perennial herb of the natural order *Compositae*, native of America, common in moist soil. The plants, which attain a height of sometimes eight feet, are often planted as ornamentals in low ground. In midsummer when the profusion of purplish or white flowers are in full blow they are striking objects. The foliage and flowers have been used as a tonic in domestic medicine, their intensely bitter taste being supposed to commend them for this purpose. See EUPATORIUM.

Bonet, Juan Pablo, hoo-an' pāh'lō bō-nēt', Spanish teacher of the deaf and dumb of the 17th century, distinguished as one of the first teachers of this class, and the author of a remarkable work 'Reducción de las letras y artes para enseñar a hablar a los mudos,' published

in Madrid, 1620. It explained his method of instruction, containing the first alphabet for the deaf and dumb, and was of good service to Dalgarno, Wallis, and, a century later, to the Abbé de l'Epée, who acknowledged his indebtedness to Bonet's labors.

Bonfiglio, or **Buonfiglio**, Benedetto, bā-nā-dēt'tō bōn-fē'lyō, Italian painter: b. 1425 (?) ; d. 1490 (?). His chief work was the frescoes of the Palazzo Comunale at Perugia, where he lived. These frescoes placed him in the first rank of the painters of the Umbrian school. It is believed that he also assisted Pinturicchio in decorating the Vatican.

Bong'abong, Philippines, a town in the southeast part of Luzon, with an estimated population of 20,000. It lies in a mountainous district, and attained military importance as the headquarters of a regiment of United States troops. The town has a municipal government based upon popular election.

Bongar, bōn'gār, a serpent of the genus *Bungarus*. See KRAIT.

Bonghi, Ruggero, rood-jā'rō bōn'gē, Italian scholar and publicist: b. Naples, 21 March 1826; d. near Naples, 22 Oct. 1895. The commencement of his brilliant career indicated scholarly activities only, for he made fine studies and versions of Aristotle and Plato; but latterly he took up such subjects as 'The Financial History of Italy, 1864-8' (1868); 'The Life and Times of Valentino Pasini' (1867), and 'The Life of Jesus' (1890); 'The Roman Festivals' (1891); the popularity and value of these and other works giving him great prominence. He held professorships in several Italian universities; was minister of public instruction in 1874-6; was a member of the Chamber of Deputies nearly continuously from 1860; founded the *Stampa*, the leading Turin journal, and the magazine 'Cultura,' of which he was editor at the time of his death; and presided over the International Peace Congress held in Rome in 1891.

Bon'go, or **Obongo**, the name of a negroid people in the basin of the Ogowe River, in the French Congo. They live by the chase, grazing, and agriculture, and are skilful workers in iron.

Bongo, a large west African bushbuck (q.v.).

Bonham, Milledge L., American lawyer and soldier: b. Edgefield, S. C., 25 Dec. 1813; d. White Sulphur Springs, N. C., 27 Aug. 1890. He graduated at South Carolina College, 1834, was admitted to the bar, 1837, and served as a representative in Congress 1840-4. In 1836 he was major and adjutant-general of the South Carolina Brigade in the Seminole war in Florida; and colonel of the 12th U. S. Infantry during the Mexican war. In 1856 he was elected to Congress as a State Rights Democrat, and re-elected in 1858, but left Congress 21 Dec. 1860, when the South Carolina delegation withdrew. Commissioned a brigadier in the Confederate army, 19 April 1861; he commanded Beauregard's centre at the first battle of Manassas, but gave up his commission to enter the Confederate Congress, 27 Jan. 1862. He was governor of South Carolina 1862-4, when he was again commissioned a brigadier-general, and was serving with Gen. Johnston

at the time of the latter's surrender. In 1868 he was a delegate to the National Democratic convention in New York.

Bonham, Texas, a town and county-seat of Trammitt County, situated on the Texas & P. and the Denison, B. & N. O. R.R.'s. It is the seat of Carlton College, and the Masonic Female Institute. As the centre of an agricultural region it has a large export trade, especially in cotton. Its chief manufacturing industries are flour mills, cotton-gins, machine-shops, carriage and wagon factories, tobacco factories, etc. Pop. (1900) 5,042.

Bonheur, François Auguste, frän-swa ä-güst bö-nër, French painter, brother of Rosa Bonheur: b. Bordeaux, 4 Nov. 1824; d. 23 Feb. 1884. The beauty of his landscapes has been much praised. He was made Chevalier of the Legion of Honor in 1867 and received numerous medals.

Bonheur, Jules Isadore, zhül ez-a-dör bö-nër, French painter and sculptor, brother of Rosa Bonheur (q.v.): b. Bordeaux, 15 May 1827. In the Salon of 1848 he exhibited both paintings and sculpture but in later years confined himself to sculpture. Medals were awarded him in 1865 and 1867. Among noted works of his are 'The Zebra and Panther'; and 'The Tiger Hunter.'

Bonheur, Marie-Rosa, mä-re rö-za bö-nër, French artist of distinction, widely known as a painter of animals: b. Bordeaux, 22 March 1822; d. Fontainebleau, 25 May 1899. She received her earliest instruction in art from her father, and when only 18 years old exhibited two pictures, 'Goats and Sheep,' and 'Two Rabbits,' which gave clear indications of talent. In 1849 a fine work, 'Labourages Nivernais,' by her, was purchased by the French government for 3,000 francs and placed in the Luxembourg collection. In 1855 'The Haymaking Season in Auvergne' was hung at the Universal Exposition in Paris, and in the same year she sent the 'Horse Fair' to the French Exhibition in London, where it was the centre of attraction for the season. It was offered by her to Bordeaux for \$6,000, but the offer being declined it was sold in England for \$20,000. It was subsequently purchased by Cornelius Vanderbilt for the Metropolitan Museum in New York. She made a quarter size replica which is now in the National Gallery in London. After this work she stood at the very head of delineators of animal life, showing a wonderful power of representing spirited action. Near her studio she had an ante-chamber as a stable for the convenient study of animals, of which she collected some noble specimens. She also attended horse markets and fairs; generally wearing masculine dress, which was not unbecoming to her strong and marked features. After 1849 she directed the Free School of Design for Young Girls in Paris. During the siege of Paris the crown prince of Prussia especially ordered that her studio and residence at Fontainebleau should be spared and respected. She received a first-class medal at the French Salon in 1849, and another in 1855; and the decoration of the Legion of Honor in 1865; was made a member of the Institute of Antwerp in 1868; received the Leopold cross from the king of Belgium in 1880, and the same year received from the king of Spain the Com-

mander's Cross of the Royal Order of Isabella the Catholic. In 1892 a celebrated painting by her, entitled 'Horses Threshing Corn,' was sold for \$60,000. It is the largest animal picture ever painted, showing 10 horses large as life. In 1896, on her 74th birthday, she furnished a painting representing the historical combat between two stallions to which Lord Godolphin invited his friends in 1734. See Larnelle, 'Rosa Bonheur, sa vie et ses œuvres' (1885); Peyrol, 'Rosa Bonheur: Her Life and Works'; Strahan, 'A History of French Painting' (1899).

Bonhomme, Jacques, zhäk bö-nöm, a term of contempt used by the French nobility to designate the common people, especially the peasants.

Bonhomme Richard, the flagship of John Paul Jones (q.v.), in the most remarkable naval victory on record, 23 Sept. 1779; originally the Duras, a worn-out unseaworthy merchant Indian assigned to him by the French government because none of their own naval officers would serve under a foreigner, and renamed by Jones from Franklin's 'Poor Richard,' because he obtained her by following one of its maxims. She had 21 guns on a side, mainly 12-pounders, with three 18-pounders aft near the water line; and a mongrel crew of Americans, British, Portuguese, and other classes. With three other vessels in the squadron Jones intercepted, off Flamborough Head, on the east coast of England, a British fleet of naval stores from the Baltic, convoyed by the Serapis (Capt. Richard Pearson) and the Countess of Scarborough. The latter was captured by one of Jones' squadron; the former about 7 o'clock on a moonlight night joined battle with the Richard, having 25 guns on a side, 10 18-pounders—a much greater weight of metal than its foe, and with far more penetrating power than the 12-pounders of the American ship. To neutralize this advantage Jones' policy was to fight at close range; and in the attempt to rake the Serapis the two vessels swung broadside to and were lashed together by Jones, and fought the rest of the battle so close that the guns could not be run out full length, their muzzles touched, and the rammers of each had to be thrust into the port-holes of the other to load. Only those of the starboard side of each could be used. Two of Jones' 18-pounders burst at the first fire; his lighter guns were gradually silenced by the Serapis; the entire sides of his vessel were shot away, so that the Serapis' shot passed through without touching anything; she caught fire in several places; she had been leaking at the outset, and now had several feet of water in the hold; and an under-officer in affright let the 200 or 300 British prisoners loose and ran to tear down the colors, but finding the flag-pole gone began to shriek for quarter. Lieut. Dale with immense presence of mind set the prisoners at the pumps, not only saving a guard but releasing the pumpmen to fight; Jones broke the officer's head with a pistol-butt, and in answer to Pearson's inquiry if he was ready to surrender, replied, "I have not begun to fight yet," though the Serapis was firing heavily and his own guns were nearly still. Meantime, however, the deadly musket fire from the Richard's top gear had made the service of the upper guns of the Serapis almost sure death, and they too were silenced; a cannon-shot

brought down her mainmast; the combustibles thrown from the Richard wrapped her upper deck in fire; at last a bucket of hand-grenades flung down her hatchways set off a mass of cartridges strewn along the decks, killing or wounding nearly all those around, and wrecking five guns; and just then Jones' ship, the Alliance—whose timid, half-insane French captain had been tacking about, occasionally firing grape-shot at random into both vessels, came near, and Pearson struck his colors, though four of his guns were still firing and his ship was sound. Jones put Dale aboard the Serapis, and tried to navigate the Richard to a friendly port; but at 9 o'clock of the 25th she had to be abandoned, and she sank about an hour later.

Boni, bō'ne, a district in the island of Celebes, and one of the principal states of the Bugis nation, with an estimated area of about 1,000 square miles. This territory is mountainous, but, though contiguous to the great volcanic belt of the archipelago, exhibits no traces of volcanic action. Lompoo-Batang (great pillar), its highest peak, and the loftiest in Celebes, attains an elevation of 8,200 feet above the level of the sea. Lake Labaya, or, as called by the natives, Taparang-Danau, in the northwest corner of this territory, is a beautiful sheet of water, 24 miles long and 13 broad, with an average depth of six fathoms, and abounds in fish. It is bordered on all sides by a luxuriant and richly diversified tropical growth, except at the mouths of the numerous little streams that empty into it, where clearings, and beautiful, picturesque little villages, attest the industry, skill, and civilized tastes of the Bugis people. Boni was formerly the most powerful state in Celebes, but since 1859 has been practically a Dutch dependency. In the north the scenery is fine, and the soil fertile—rice, sago, and cassia being produced. The inhabitants have an allied language to the Macassars, with a literature of their own. Their towns and villages dot the coast, and as enterprising merchants and sailors the Bugis are found in every port of the East Indian Archipelago; they also engage in agriculture and in the manufacture of cotton and articles of gold and iron, in which they have a large trade. They are well built, active, and brave, and are lighter skinned, as well as superior in honesty and morality to other Malay races. Their institutions, said to be very ancient, partake of the character of a constitutional monarchy. The British have twice attacked the Bonese for injuring their commerce, and selling the crews of British ships into slavery. In the second attack, in 1814, the Bonese king was killed. The number of the population is unknown, being variously estimated from 200,000 to 300,000. The capital, called Boni, stands on the coast of the southwest peninsula. The Gulf of Boni separates the southeast and southwest peninsulas of Celebes. It is 200 miles long, and 40 to 80 miles broad.

Boniface, Saint, the apostle of Germany, who first preached Christianity and spread civilization among the Germans: b. Crediton, England, 680; d. Dokkum, West Friesland, 5 June 755. His original name was Winfrid. In his 30th year he was consecrated a priest. A great part of Europe at this period was inhabited by heathen peoples, and several missionaries set

out from England and Ireland to convert them. Among these was Boniface, who in 718 went to Rome, where Gregory II. authorized him to preach the gospel to the nations of Germany. He commenced his labors in Thuringia and Bavaria, passed three years in Friesland, and journeyed through Hesse in Saxony, baptizing everywhere, and converting the pagan temples to Christian churches. In 723 he was invited to Rome, made a bishop by Gregory II., and recommended to Charles Martel and all princes and bishops. His name Winfrid he changed to Boniface. He destroyed the oak sacred to Thor, near Geismar, in Hesse, founded churches and monasteries, invited from England priests, monks, and nuns, and sent them to Saxony, Friesland, and Bavaria. In 732 Gregory III. made him archbishop and primate of all Germany, and authorized him to establish bishoprics, the only existing bishopric being the one at Passau. He founded those of Freising, Ratisbon, Erfurt, Baraburg (transferred afterward to Paderborn), Würzburg, and Eichstätt. In 739 he restored the episcopal see of St. Rupert, at Salzburg. After the death of Charles Martel he consecrated Pepin the Short, king of the Franks, in Soissons, by whom he was named Archbishop of Mainz. He held eight ecclesiastical councils in Germany, founded the famous abbey of Fulda, and undertook in 754 new journeys for the conversion of the infidels. In Fulda a copy of the gospels, in his own handwriting, is to be seen, and there is a statue to him also. At the place where Boniface built, in 724, the first Christian church in North Germany, near the village of Altenburg, in the Thuringian forest, a monument has been erected to his memory. The most complete collection of the letters of Boniface was published at Mainz, 1789, folio; and of his entire works, 2 volumes, Oxford, 1845. See Lives by Cox (1853); Werner (1875); Fischer (1880); Ebrard (1882).

Boniface, the name of several Popes. **BONIFACE I.**, elected 418 by a party of the clergy, and confirmed by the Emperor Honorius, who declared the anti-pope Eulalius a usurper. Boniface condemned Pelagianism, and extended his authority by prudent measures. In a contest with the Emperor Theodosius, who endeavored to take from the bishops of Thessalonica their canonical jurisdiction over Illyria, he successfully vindicated the primacy of the Roman See. **BONIFACE II.**, elected 530; d. 532. The death of his rival, the anti-pope Dioscorus, a few days after his election, left him in quiet possession of the papal chair. During his pontificate St. Benedict laid the foundations of monasticism in the West. **BONIFACE III.**, chosen 607, died nine months after his election. **BONIFACE IV.**, reigned 608-615. He consecrated the Pantheon to the Virgin and all the saints. **BONIFACE V.**, a Neapolitan, was Pope 610-625. He confirmed the inviolability of the asylums, and endeavored to diffuse Christianity among the English. **BONIFACE VI.**, a Roman, elected 806, died a fortnight after. **BONIFACE VII.**, anti-pope, elected 974 during the lifetime of Benedict VI., whose death he was suspected of having caused. Expelled from Rome he returned on the death of Benedict VII., and found the chair occupied by John XIV., whom he deposed and threw into prison, where he died. Boniface died 11 months after his return. **BONIFACE VIII.**,

Benedict Gaetano: b. Anagni of an ancient Catalan family; elected Pope 24 Dec. 1294. He studied jurisprudence, was a canon at Paris and Lyons, advocate of the consistory, and prothonotary of the Pope at Rome. After Martin IV. had elevated him to the dignity of a cardinal (1281) he went as legate to Sicily and Portugal, and was intrusted with the charge of reconciling the king of Sicily with Alphonso of Aragon, and Philip the Fair with Edward I. of England. After Cœlestine V. had resigned the papal dignity at Naples, in 1294, at the instigation of Boniface, the latter was chosen Pope. He met with opposition from the cardinals of the family Colonna, whose antagonism followed him throughout his entire pontificate. His induction was magnificent. The kings of Hungary and Sicily held his bridle on his way to the Lateran, and served him at table with their crowns on their heads. Boniface, however, was not successful in his first efforts for the increase of his power. He first opposed Albert of Austria in his contest for the imperial title, but finally yielded and crowned him emperor. He was equally unsuccessful in his attempt to arbitrate between England and France. The bulls which he issued at this time against King Philip the Fair of France obtained no consideration. This was also the case with the interdict which he pronounced against him at the Council of Rome in 1302. Intimidating the clergy in France, Philip refused to yield to the Pope's decrees. The Pope was accused of duplicity, of simony, of usurpation, of heresy, of unchastity; and it was resolved to condemn and depose him at a general council at Lyons. Philip went still further; he sent Nogaret to Italy in order to seize his person and bring him to Lyons. Nogaret united himself for this purpose with Sciarra Colonna, who with his whole family were bitterly inimical to Boniface. Boniface fled to Anagni, where Nogaret and Colonna surprised him. Boniface acted with spirit. "Since I am betrayed," said he, "as Jesus Christ was betrayed, I will die at least as a Pope." He assumed the pontifical robes and the tiara, took the keys and the cross in his hand, and seated himself in the papal chair. But the insignia of his holy office did not save him from seizure. Nay, Colonna went so far as to use personal violence. Boniface remained in imprisonment for two days, when the Anagnese took up arms and delivered him. After this he departed to Rome, where he died, a month later, in 1303. BONIFACE IX., Pietro Tomacelli of Naples, succeeded Urban VI. at Rome during the schism in the Church, while Clement VII. resided in Avignon. He was distinguished for the beauty of his person and the elegance of his manners, rather than for a profound knowledge of theology and canon law. Even the counsel of his experienced cardinals could not save him from the commission of gross blunders. He made the annates a regular tax in 1392. Many abuses in the sale of benefices were indulged during his pontificate. A notable event in his reign was the suppression of the rebellion in Rome in favor of a Republic. He supported the pretensions of Ladislaus to the throne of Naples, and during the greatest part of his pontificate was engaged in negotiations at Avignon with his rivals, Clement VII. and Benedict XIII. He died 1404.

Bonifacio, Veneziano, vā-nād-zē-ā'nō bō-ne-fā'chō, Italian painter: b. Venice, about 1525; d. about 1579. He belonged to the Venetian school and his 'Saint Jerome and Saint Margaret'; 'Saint Barnabas and Saint Sylvester'; 'Saint Anthony and Saint Mark' are still in the Venice Academy.

Bonifacio, bō-ne-fā'chō, **Strait of**, the *Fretum Gallicum* of the Romans, lies between Corsica and Sardinia, and at the narrowest part is only seven miles wide. The navigation is difficult owing to the rapid current and the great number of rocks, which, however, are favorable to the production of coral.

Bonifazio Veronese, bō-ne-fātse-o vā-rō-nā'sā (THE ELDER), Italian painter: b. Verona, 1490; d. 1540. He was a notable colorist of the Venetian school and many of his works have been attributed to Titian and to Giorgione, whose styles he imitated. Among known works of his are 'The Finding of Moses' in the Dresden Gallery, and 'Dives and Lazarus' in the Venice Academy.

Bonin (bō-nēn') **Islands**, several groups of islands, North Pacific Ocean, extending from lat. 27° 44' 30" to 26° 30' N., south of and belonging to Japan. The northwest island of the most northern cluster, called Parry Group, is in lat. 27° 43' 30" N.; lon. 142° 8' E.; the cluster consists of small isles. The largest of the chain is Peel Island, on the west side of which is a good harbor called Port Lloyd, in lat. 27° 5' 30" N.; lon. 142° 11' 30" E., nearly surrounded by hills crowned with palm trees. Almost every valley has a stream of water. Green turtle abound in the sandy bays. Sharks are numerous, and fish of several kinds plentiful. Peel Island is inhabited by some English, Americans, and Hawaiians, who cultivate maize, vegetables, tobacco, and the sugar-cane. It is frequently visited by vessels in want of water and fresh provisions. The islands were discovered by the Japanese in 1593 and since 1876 have been in the possession of Japan. Pop. about 1,400.

Bonington, or **Bonnington**, **Richard Parkes**, English painter: b. 25 Oct. 1801, at Arnold, a village near Nottingham, where his father was a painter and lace manufacturer; d. London, 23 Sept. 1828. When Richard was in his boyhood the family removed to Calais and afterward to Paris. He early displayed a decided predilection for art, and entered as a student at the Louvre, and was also for a time in the studio of Baron Gros. His genius displayed itself in landscape-painting, and he rapidly rose to great eminence in this department, first in Paris and afterward in England, to whose Royal Academy Exhibition he contributed several pictures which created a great sensation. He worked at first entirely in water-color, but from about 1825 he also used oil. A brilliant career was in prospect for him, when he was cut off by pulmonary consumption. See Muther, 'History of Modern Painting' (1896).

Bonito, bō-nē'tō, a fish of the mackerel family (*Scombrida*) nearly related to the gigantic tunny, but smaller, longer in body, and without teeth on the vomer. There are two American species. One (*Sarda sarda*) lives in the open seas, except at spawning time, from Cape Cod to Cape Sable, and occasionally in the Gulf of Mexico, where it weighs 10 to 12 pounds. In color it is dark steel blue above,

with numerous dark narrow strips obliquely downward and forward from the back, and the under parts, silvery. The California bonito or skipjack (*Sarda chiliensis*), is heavier and is found from San Francisco northward to Japan. In the tropics, the bonito is known as the worst foe of the flying-fish. On the Rhode Island coast the fish is called abbicore.

Bonitz, Hermann, hër'män bō-nīts, German classical scholar: b. Langensalza, 29 July 1814; d. Berlin, 25 July 1888. He was professor in the University of Vienna, 1849-67, director of a gymnasium at Vienna from 1867, and a member of the Academy of Sciences. He was a profound student of Plato and Aristotle and was the author of 'Ueber die Kategorien des Aristoteles' (1853); 'Platorische Studien' (1858-60); 'Aristotelische Studien' (1862-7).

Bonn, a city of the Prussian province of the Rhine, formerly the residence of the Electors of Cologne, on the left bank of the Rhine, over which there is a magnificent new bridge, erected at a cost of \$1,000,000, with a central span of 600 feet. It is a flourishing place, and has been greatly extended and improved in recent years, though it still has many narrow irregular streets. The town hall, completed 1782, is one of the handsomest of its edifices. Another important building is the cathedral, cruciform in plan, and forming an imposing and picturesque example of the late Romanesque style of architecture. The greater part of it dates from the 13th century. But all other buildings and institutions are eclipsed by the celebrity of the university, the charter of which was given 18 Oct. 1818, at Aix-la-Chapelle, by the king of Prussia, who at the same time endowed it with an annual income of about \$60,000. The former residence of the Elector of Cologne was bestowed on the university, and was fitted up at great expense, being surpassed in extent and beauty probably by no university building in Europe. The university possesses a library of more than 275,000 volumes, 1,235 incunabula and 1,376 MSS.; a museum of antiquities, a collection of casts of the principal ancient statues, a collection of coins, observatory, botanic garden, etc. The paintings in the Academical Hall (among others, the great allegorical picture, the 'Christian Church') were executed by some pupils of Cornelius. In the front of the university is an extensive garden, with fine old avenues of trees, while from this quarter runs westward a broad straight avenue, half a mile long, planted with horse-chestnuts, passing the observatory, and leading to the botanic garden and natural history collections of the university, and to the chemical laboratory, the anatomy building, etc. In this quarter also are grounds and buildings for the use of the agricultural institute. Particular advantages are afforded for the education of young men intended for instructors. Many men distinguished in various branches of science have been connected with the university, including Arndt, A. W. Schlegel, and the historian Niebuhr. The exertions of the government to collect in Bonn all the means of instruction, united with the charms of the place and the beauties of the scenery, have made the place famous. In 1901 the students numbered over 2,400. The manufactures, which are not very

important, comprise carpets, machinery, soap, chemicals, stoneware, etc. The means of communication are ample, both by the steamers which ply upon the Rhine and by the railways. Prince Albert studied at Bonn and Beethoven was born there, the house of his birth being now a museum. There are statues of Beethoven and Arndt, a monument commemorative of the war of 1870-1, a monumental fountain, etc. The antiquity of Bonn is considerable, and, as the residence of the electors of Cologne, it is of historical importance. Pop. (1900) 50,737.

Bonn, University of. See BONN.

Bonnassieux, Jean, zhōn bō-nā-syē, French sculptor: b. Paimisseries, 1810; d. 1892. He studied in Paris and in 1836 received the Prix de Rome. He gained the favor of the French clergy by refusing to model a statue of Voltaire for the façade of the Louvre and thereafter did much work for churches. He was commissioned in 1857 to model a colossal statue of Notre Dame de France for the valley of Puy from the bronze cannon taken at Sebastopol. Other important works of his are 'Amour se conpant les ailes'; 'David Berger, 1814'; and 'Meditation,' for which last he received the cross of the Legion of Honor.

Bonnat, Léon Joseph Florentin, lā-ōn zhō-sēf flō-rōn-tān bō-nā, French painter: b. Bayonne, 20 June 1833. When a young man he spent several years in Spain and Italy. He studied under Madrazo at Madrid, and under Léon Cogniet at Paris, first gaining recognition at the Paris Salon in 1861, when he received a second-class medal. The list of his honors is a large one, including the medal of honor at the Salon of 1869. In the Legion of Honor he was made chevalier in 1867, officer in 1874, and commander in 1882. He paints portraits and genre subjects; many of these are reminiscences of his visits to Italy and Egypt. He became a member of the Institute in 1874, and was chosen chief professor of painting in the Ecole des Beaux Arts in 1888. His work shows the influence of Velasquez and Ribera, and his portraits, such as those of Thiers, Victor Hugo, and Don Carlos, are remarkable for their realism. He has painted the portraits of many Americans and his portrait work is well known in this country.

Bonnechese, François Paul Emile Boissnormand de, frān-swā pōl ā-mēl bwā-nōr-mān bōn-shōz, French poet and historian: b. Leyerdorp, Holland, 1801; d. 1875. He was librarian of the palace of Saint Cloud for some years and subsequently held similar posts. His one notable poetical composition is 'The Death of Bailly' (1833). Besides a 'History of France' he was author of 'Reformers Before the 16th Century Reformation' (1844); 'The Four Conquests of England' (1851); 'History of England' (1859); 'Bertrand du Guesclen' (1866).

Bonnemère, Joseph Eugène, zhō-sēf é-zhān bōn-mār, French historian: b. Saumur, 21 Feb. 1813. In early life he wrote a number of plays; but owes his reputation to a series of historical publications, 'History of the Peasants' (1856); 'Vendee, in 1793' (1866); 'Popular History of France' (1874-9); 'History of the Religious Wars in the Sixteenth Century' (1886); etc.

Bonner, Edmund, English prelate: b. about 1495; d. London, 5 Sept. 1569. For his skill in canon law he was patronized by Cardinal Wolsey, on whose death he acquired the favor of Henry VIII., who made him one of his chaplains, and sent him to Rome on business connected with his divorce from Queen Catharine. In 1535 he was made archdeacon of Leicester. In 1538 he was nominated bishop of Hereford, being then ambassador at Paris; but before his consecration he was translated to the see of London. In 1542-3 he was ambassador to the Emperor Charles V. After Edward VI.'s accession in 1547 he was deprived of his bishopric for non-obedience in connection with the injunctions and the 'Book of Homilies.' He was shortly afterward restored, but still continuing to act with contumacy, he was, after a long trial, once more deprived of his see, and committed to the Marshalsea (1549); from which prison, on the accession of Mary, he was released, and once more restored in 1553. During this reign a most sanguinary persecution of the Protestants took place, many of whom Bonner was instrumental in bringing to the stake, though it appears he was hardly severe enough to meet the wishes of the king and queen. When Elizabeth succeeded he went with the rest of the bishops to meet her at Highgate, but was coldly received. He remained, however, unmolested, until his refusal to take the oath of supremacy; on which he was committed to the Marshalsea (1560), where he remained a prisoner for nearly 10 years, until his death. He was buried at midnight, to avoid any disturbance on the part of the populace, to whom he was extremely obnoxious.

Bonner, Robert, American publisher: b. near Londonderry, Ireland, 28 April 1824; d. New York, 6 July 1899. Coming to the United States in 1839 he learned the printer's trade on the *Hartford Courant*, and gained the reputation of being the most rapid compositor in Connecticut. In 1844 he removed to New York, and seven years later had saved enough money to buy the plant of the 'Merchants' Ledger,' a small business periodical. Changing its name to the 'New York Ledger,' he turned it into a literary publication, printing the most popular kind of stories. This, combined with sensational advertising methods, and the unprecedented prices paid to famous contributors, soon gave the 'Ledger' an enormous circulation. Henry Ward Beecher was paid \$30,000 for his 'Norwood'; Tennyson received \$5,000 for a short poem, and Dickens the same amount for a short story. At times \$25,000 a week was spent in advertising the paper. Retiring in 1887, the rest of his life was spent in indulging his taste for fast horses. It was his ambition to own the fastest trotters in existence, and whenever he purchased a record breaker, the animal was immediately withdrawn from public racing. His expenditures for fast horses exceeded \$600,000. Some of them and their cost were: Dexter, \$35,000; Rarus, \$36,000; Maud S., \$40,000; Sunol, \$41,000. He was a generous giver to many charitable institutions and causes, to Princeton University and the Fifth Avenue Presbyterian Church. He had a genuine dislike for publicity, and many of his benefactions were never made public till after his death.

Bonnet, Charles, Swiss naturalist and metaphysician: b. Geneva, 13 March 1720; d. Genthod, 20 May 1793. His essay 'On Aphides,' in which he proved that they propagated without coition, procured him in his 20th year the place of a corresponding member of the Academy of Sciences at Paris. Soon afterward he partook in the discoveries of Trembley respecting the polypus, and made interesting observations on the respiration of caterpillars and butterflies, and on the structure of the tapeworm. Bonnet was a close and exact observer. He carried religious contemplations into the study of nature. In his views of the human soul many traces of materialism are to be found; for instance, the derivation of all ideas from the movements of the nerve fibres. Of his works on natural history and metaphysics there are two collections; one in 9 volumes 4to, the other in 18 volumes 8vo (Neufchâtel, 1779). The most celebrated are 'Traité d'Insectologie'; 'Recherches sur l'Usage des Feuilles dans les Plantes'; 'Considérations sur les Corps organisés'; 'Contemplation de la Nature'; 'Essai analytique sur les Facultés de l'Ame'; 'Palingénésie Philosophique'; and 'Essai de Psychologie.'

Bonnet, in fortification, an elevation of the parapet at a salient angle, designed to prevent the enfilading of the adjoining front of the work, where it is situated. The bonnet accomplishes, however, only part of this object, and is subject, at least in field-works, to the disadvantage, that the men destined for its defense are too much exposed to be taken in flank by the fire of the enemy, on account of the necessary elevation of the banquette, a fault which cannot occur in the works of a fortress which are well laid out. The term also denotes a covering for the head, now especially applied to one worn by females. In England the bonnet was superseded by the hat as a head-dress two or three centuries ago, but continued to be distinctive of Scotland to a later period.

Bonnet-head, a small shark of the genus *Reniceps*, frequenting warm seas and related to the shovel-heads (q.v.).

Bonnet Monkey. See MACAQUE.

Bonnet-piece, a Scotch coin, so called from the king's head on it being decorated with a bonnet instead of a crown. It was struck by James V., and is dated 1539. Bonnet-pieces are very rare and in high estimation among antiquaries.

Bonnet-rouge, bō-nā-roozh, an emblem of liberty during the French Revolution, and worn as a head-dress by all who wished to show themselves sufficiently advanced in democratical principles. It is said by some to have been adopted in imitation of the Phrygian cap of the same color which was worn by those who had obtained emancipation from slavery, while others maintain that it had a much more lowly origin, and was borrowed either from the Marsellais bands that flocked to Paris, or from a few Swiss soldiers who, having been sentenced to the galleys for insubordination to their officers, obtained their liberty on the acceptance of the constitution in 1790. Having returned in a kind of triumphal procession, wearing the red cap, which had formed part of their galley dress, the fancy of the people was struck, and the

bonnet-rouge was considered indispensable to every true patriot. Even the unfortunate Louis XVI. wore it when paraded through the streets, after narrowly escaping with his life from the mob which had burst into his palace. After it had ceased to be generally worn, it became the distinctive badge of the men of the Mountain. During the storms of more recent periods attempts have repeatedly been made to bring it again into fashion. These have not been successful, but the revolutionary cap rejected by France has met with a more favorable reception abroad, particularly among the newly formed republics of America, where it is often stamped upon coins, or used as an emblem upon seals. Under the restoration of the Bourbons the sou-briquet of bonnets-rouges was applied to individuals who either had figured in the revolution or were supposed to hold revolutionary principles.

Bonneval, bôn-vał, Claude Alexander (COUNT DE OR ACHMET PASHA), French adventurer: b. Coussac, 1675; d. Constantinople, 1747. In the war of the Spanish Succession he obtained a regiment and distinguished himself by his valor as well as by his excesses. He was, in 1706, appointed major-general by Prince Eugene, and fought against his native country. At the Peace of Rastadt in 1714, by the interference of Prince Eugene, the process against him for high treason was withdrawn, and he was allowed to return to his estates. In 1716 he was lieutenant field-marshal of the Austrian infantry, and distinguished himself by his valor against the Turks at Peterwardein (1716). In 1718 Bonneval was made a member of the imperial council of war, but his licentiousness and indiscretion induced Prince Eugene to get rid of him by appointing him in 1723 master-general of the ordnance in the Netherlands. To revenge himself on Eugene, he sent complaints to Vienna against the governor, the Marquis de Prié; but the latter received an order to arrest Bonneval, and to imprison him in the citadel of Antwerp. Bonneval being afterward ordered to appear at Vienna and give an explanation of his conduct, spent a month at The Hague before he chose to comply with the summons. He was therefore confined in the castle of Spielberg, near Brünn, and condemned to death by the imperial council of war; but the sentence was changed by the emperor into one year's imprisonment and exile. Bonneval now went to Constantinople, where the fame of his deeds and his humanity toward the Turkish prisoners of war procured him a kind reception. He consented to change his religion, received instructions in Mohammedanism from the mufti, and received the name of Achmet, with a large salary. He was made a pasha of three tails, commanded a large army, defeated the Austrians on the Danube, and quelled an insurrection in Arabia Petrea. His exertions, as commander of the bombardiers, to improve the Turkish artillery, were opposed by the jealousy of powerful pashas, the irresolution of Mohammed V., and the dislike of the Turkish troops to all European institutions. He enjoyed, however, the pleasures of his situation. The memoirs of his life under his name are not genuine.

Bonneville, bôn-vil, Benjamin L. E., American soldier and explorer: b. France about 1795;

d. Fort Smith, Ark., 12 June 1878. He graduated from West Point 1815, became a captain of infantry 1825; and in 1831-6 engaged in an exploring expedition to the far West, across and beyond the Rocky Mountains. His journal and other manuscripts were edited and enlarged by Washington Irving, who published them under the title of 'Adventures of Captain Bonneville, U. S. A.' (1837). He fought with gallantry in the Mexican war, taking part in the siege of Vera Cruz, the battle of Cerro Gordo, the capture of San Antonio, battle of Churubusco, where he was wounded, the battle of Molino del Rey, the storming of Chapultepec, and the ensuing assault and capture of the city of Mexico. In 1857 he commanded the Gila expedition, and in 1861 was retired from active service, "for disability resulting from long and faithful service, and from sickness and exposure in the line of duty." In 1865 he was brevetted brigadier-general in the regular army "for long and faithful services." See Cullum, 'Officers and Graduates of the U. S. Military Academy,' Vol. I. (1868).

Bonneville, Lake, a lake of the Pleistocene epoch that twice filled a now desert basin of Utah. At its greatest dimensions it had an area of 20,000 square miles, and was 1,000 feet deep.

Bonney, Charles Carroll, American lawyer: b. Hamilton, N. Y., 4 Sept. 1831; d. Chicago, Ill., 1903. In 1850 he removed to Peoria, Ill., took an active part in establishing the present educational system of that State; was admitted to the bar 1852, settled in Chicago in 1860, and acquired a large and successful practice. He was one of the originators of the law and order movement and was president of the National Law and Order League 1885-93. In 1893 he was the organizer and general president of the World's Congresses held at the Columbian Exposition; there were over two hundred of them, and they proved a marked feature of the World's Fair. Besides numerous pamphlets, addresses and essays on public questions he has written 'Rules of Law for the Carriage and Delivery of Persons and Property by Railway' (1864); 'Summary of the Law of Marine, Fire, and Life Insurance' (1865); 'Our Remedy in the Laws' (1887); and edited A. W. Arrington's 'Poems' (1869).

Bonney, Thomas George, English geologist: b. Rugeley, 27 July 1833. He was president of the Geological Society of London 1884-6, and in 1899 became vice-president of the Royal Society. He has written 'Outline Sketches in the High Alps of Dauphine' (1865); 'The Alpine Regions' (1868); 'The Story of Our Planet' (1893); 'Charles Lyell and Modern Geology' (1895); 'Ice Work' (1896); 'Volcanoes' (1898), and four volumes of Sermons.

Bonnie Blue Flag, a popular Confederate ballad first sung in public at the Varieties Theatre in New Orleans in 1861.

Bonnières, Robert de, ro-bâr dé bôn-nî-âr, French journalist and novelist: b. Paris, 7 April 1850. He began his literary career as contributor to Paris journals of spirited but waspish biographies of contemporary men; these were collected and published in three successive volumes of 'Memoirs of To-Day.' His novels are full of transparent allusions to noted persons,

and have had a very great vogue. In one of them, 'The Monarch,' he portrays high Jewish society in Paris.

Bonnivard, François de, frän-swä dē bō-ne-vär, Swiss patriot, a younger son of a family which held large possessions under the House of Savoy: b. Syssel about 1496; d. Geneva, 1570. In 1513 he became prior of St. Victor at Geneva, but falling under the suspicion of the Duke of Savoy, was taken prisoner by him in 1519. After 20 months' imprisonment he was set free, but in 1530 he was again seized and taken to the castle of Chillon at the east end of the Lake of Geneva, where he was imprisoned for six years, the last four in that subterranean vault which Byron has made famous by his poem on the sufferings of 'The Prisoner of Chillon.' He left the town his books, which were the nucleus of the Geneva library. His chief works are his 'Chroniques de Genève' (1551; new ed. 2 vols. 1831), and 'De l'Ancienne et Nouvelle Police de Genève' (1555). See Gribble, 'Lake Geneva and Its Literary Landmarks' (1901).

Bonny, a river of west Africa, one of the mouths of the Niger. The town of the same name is situated on the eastern bank of the river near its mouth. It has a good harbor and does a considerable trade in palm-oil, but the climate is unsuitable for Europeans. Pop. about 8,000.

Bonnycastle, Charles, English mathematician: b. Woolwich, 1792; d. Charlottesville, Va., October 1840. He was professor of mathematics at Woolwich Military Academy, professor of natural philosophy in the University of Virginia (1825-7), and of mathematics there from 1827. His publications included 'Elements of Geometry'; 'Elements of Algebra'; 'Mensuration,' etc.

Bonnycastle, Sir Richard Henry, English military engineer: b. 1791; d. 1848. He was a brother of Charles Bonnycastle (q.v.) and spent the greater part of his life in British North America. He was author of 'Spanish America' (1818); 'The Canadas in 1842' (1842); 'Canada and the Canadians in 1846' (1846); and 'Canada as It Was, Is, and May Be' (1846).

Bonomi, Giuseppe, joo-sěp'pě bō-nō'mē, Italian artist: b. Rome, 9 Oct. 1796; d. 3 March 1878. He was a son of Giuseppe Bonomi, the architect. He studied art in London, and became famous as a draftsman, especially of Egyptian remains. He repeatedly visited Egypt and the Holy Land, and illustrated important works by Wilkinson, Birch, Sharpe, Lepsius, and other Egyptologists. He also published a work of his own on Nineveh, and at his death was curator of Soane's Museum.

Bononcini, or Buononcini, Giovanni Battista, jō-vān'ne bō-nōn-chē'ne, Italian composer: b. Modena about 1660; d. about 1750. His proficiency on the violoncello gained him admittance into the band of the Emperor Leopold at Vienna, where, at the age of 18, in emulation of Scarlatti, he wrote an opera called 'Camilla,' which was favorably received. In England for several years scarcely any opera was tolerated which did not contain some of Bononcini's airs, and upon the almost simultaneous arrival of himself and Handel in London, notwithstanding the superiority of the latter, two parties, the one for Bononcini and the

other for Handel, were formed, between whom an exciting contest was waged for several years. Gradually, however, Bononcini's popularity waned, and having been detected in an act of musical plagiarism, he left England in 1733, found his way to Paris and Vienna, and finally went to Venice, where all traces of him are lost.

Bononcini, Giovanni Maria, Italian musician: b. Modena, 1640; d. 19 Nov. 1678. He was educated at Bologna, was in the service of the Duke of Modena, Francis II., and also maestro di capella of San Giovanni in Monti. He was considered an authority on the theory of music on account of his work 'Musico pratico'; he also wrote numerous musical compositions, both vocal and instrumental.

Bonone, bō-nō'nā, Carlo, Italian painter: b. Ferrara, 1569; d. 1632. He studied the works of the Caracci and Veronese, and shows the influence of both styles in his own work. He taught painting in Ferrara, having many prominent painters of the town under his instruction. Among his paintings are 'The Arisen Christ' and 'Patriarchs and Prophets.'

Bonpland, Aimé, ā-mā bōn-plān, JACQUES ALEXANDRE, French naturalist, noted as the friend of Humboldt, and the companion of his wanderings: b. Rochelle, 22 Aug. 1773; d. Corrientes, Argentina, May 1858. He studied medicine, and served for a while in the French navy as surgeon. Having returned to Paris to continue his studies, he there made the acquaintance of Humboldt, then a young man actively engaged in the pursuit of scientific knowledge at the French capital. On the latter projecting his journey to the New World, Bonpland readily agreed to accompany him, and shared in all the adventures and toils of that celebrated expedition. In the course of it he collected upward of 6,000 plants, previously unknown, and on his return to France in 1804 presented his herbarium to the Museum of Natural History, and had a pension granted him by the Emperor Napoleon. A great friendship subsisted between him and the Empress Josephine, who frequently endeavored to cultivate in her garden at Malmaison the flowers whose seeds he had brought from the tropics. On the Restoration he proceeded to South America, and became professor of natural history at Buenos Ayres. He subsequently made an extensive journey across the Pampas to the foot of the Andes, and ascended the river Parana into Paraguay, but was arrested by Dr. Francia, the governor of Paraguay, as a spy, and detained a prisoner for eight years, till 1820. He afterward settled at San Borja, near Monte Video, and after 1850 lived at Corrientes.

Bonsal, Stephen, American journalist: b. Virginia, 1863. He was educated at Concord and Heidelberg. In the Bulgarian-Servian war he was special correspondent of the New York Herald, serving in the same capacity in Macedonia and Cuba. He has been secretary of Legation of the United States in Pekin, Madrid, Tokio, and Corea. He has written 'The Real Condition of Cuba'; 'The Fight for Santiago'; 'Morocco as It Is'; 'Across the Pacific.'

Bonstetten, bōn-stět'en, Karl Victor von, Swiss publicist: b. Bern, 3 Sept. 1745; d. Geneva, 3 Feb. 1832. He studied at Leyden, Cam-

bridge, and Paris; entered the council of Bern, and became district governor, and, in 1795, a judge in Lugano. He lived in Italy and at Copenhagen from 1796 to 1801, and after his return settled at Geneva. Among his larger works are 'Recherches sur la Nature et les Loix de l'Imagination' (Geneva 1807); 'Pensées Diverses' (1815); 'Etudes de L'Homme' (1821), and 'L'Homme du Midi et L'Homme du Nord' (1824), an examination of the influence of climate. Several volumes of his correspondence have been published.

Bontebok, bôn'te-bök, a small South American antelope (*Bubalis pygargus*) closely allied to the bleesbok (q.v.), but a slightly larger size, and having the continued white blaze on the face to the root of the lyrate horns. See HARTHEEST.

Bonus Bill, an act reported to the United States House of Representatives by John C. Calhoun, 23 Dec. 1816, appropriating "as a fund for constructing roads and canals" the \$1,500,000 paid by the United States bank as a bonus for its charter privileges, and all future dividends from its stock. The real object was to build the Erie Canal, which New York did not feel able to do alone. Its managers,—De Witt Clinton, Gouverneur Morris, etc.,—relying on the administration holding the same ideas which Jefferson and Gallatin had formerly voiced, formed a "log-roll" in Congress with various local interests, and carried the bill by 86 to 84 in the House, and 20 to 15 in the Senate, the opposition being scatteringly local rather than sectional, or constitutional; but Madison vetoed it on strict-construction grounds. The apparent injury was to New York: the real injury was to the South. New York went on and built the canal herself, giving her an irresistible advantage over her rivals, while the South was not rich enough to build the canals from the Chesapeake to the Ohio, enriching Maryland and Virginia, nor from the Santee to the Tennessee, enriching the Carolinas and Tennessee, and if the general government had helped the Erie it must have helped the others also.

Bonvalot, Pierre Gabriel, pe-är gä-brê-ël bôn-va-lô, French explorer: b. Espagne, Aube, 1853. He traveled in central Asia, 1880-2; Persia, Turkestan, and the Pamirs, 1885-7; and in Siberia and Tonkin, 1889-90. He has written 'En Asie Centrale'; 'Du Moscou en Bactriane' (1884); 'Du Kohistan à la mer Caspienne' (1855); 'Du Caucase aux Indes à travers le Pamir' (1888).

Bonvin, François Saint, frän-swä sän bôn-vän, French genre painter: b. Vaugirard, 22 Sept. 1817; d. Saint Germain-en-Laye, 18 Dec. 1887. He was self-taught, exhibited often at the Paris Salon and received the medal of the Legion of Honor in 1870. For a long period his work was not popular, but his paintings are now much prized by collectors on account of their rich coloring and sober tone. Among them are 'Charity' (1852); 'Regimental School' (1853); 'Corner in a Church' (1880).

Bony-fish. See MENHADEN; TEN-POUNDER.

Bony, or Gar Pike. See GAR.

Bonzes, bôn'zēs, a name given by Europeans to the priests of the religion of Fo, or Buddha, in eastern Asia, particularly in China, Burma, Tonquin, Cochin-China, and Japan.

As these priests live together in monasteries, unmarried, they have some resemblance to the monks of the Christian Church. They do penance, and pray for the sins of the laity, who secure them from want by endowments and alms. The female bonzes may be compared to the Christian nuns, as the religion of Fo suffers no priestesses, but admits the social union of pious virgins and widows, under monastic vows, for the performance of religious exercises. The bonzes are commonly acquainted only with the external forms of worship and the idols, without understanding the meaning of their religious symbols.

Booby, a name given long ago by British sailors to several of the smaller tropical species of gannet (q.v.), because of their "stupidity," which consisted simply in their fearlessness when visited upon their island breeding places. Having had no acquaintance with mankind they had no reason to fear him. Most of the species are widespread, and, in their haunts abundant. One species (*Sula variegata*) is, however, confined to the coasts of Peru, where it contributes largely to the valuable guano deposits on the islands there.

Book. Used without qualification, the term currently implies a printed literary composition in many sheets; but in law and custom it has received three extensions, one of form and two of matter. The form includes anything bound like a book—volumes of accounts, or of blank leaves for keeping them or for indexing, etc., and even "books" of gold-leaf, 25 thin strips in a cover. The matter includes—by English statute law, "every volume, part or division of a volume, pamphlet, sheet of letter-press, sheet of music, map, chart, or plan separately published"; in literary usage, the written compositions of ancient times on whatever material, if of some volume.

Historically, it is curious that primitive attention has invariably seized first on, and named the writing after, neither form nor matter, nor even the method of writing, but the material on which the writing was executed: every name in common use, present or past, refers to this. "Book," A.-S. *bōc*, is from an old Teutonic *boks*, that is, "the beeches," tablets of beech-bark on which runes were cut or painted; Latin *liber*, whence French *livre* and our "library," was the same thing, the inner bark of a tree, and the name was later given to the papyrus tissue from its bark-like appearance; *codex* or *caudex*, our "code," and still used in its Latin form for old texts, meant the trunk of a tree, then wooden tablets, then square volumes like wooden blocks instead of those in scrolls; the Greek *byblos*, our "Bible," was another name for the papyrus; and modern usage clings to the same connection of ideas—we speak of reading "a paper" before an audience. On the other hand, the words "write," "inscribe," and "scripture," and the various "graphs," all from words meaning to cut, commemorate a time when all writing was by scoring lines on some hard substance. Of course special terms refer to various aspects of the book: "volume" (Latin *volumen*, from *volvo*, to roll) was the wooden roller around which a convenient section of a long composition was twisted; "tome" means a cutting—of the book into parts, exactly the same as "section."

It is difficult to say at just what point the ancient writings may properly be called "books." It is evident that mere scorings or paintings of short compositions on a single surface—runes, hymns, poems, epistles, proclamations, business documents, or what not—cannot be called books, even if the surface is large; though Lord Macaulay facetiously speaks of a rising young Assyrian architect who "published a bridge and four walls in honor of the reigning emperor." On the other hand, long compositions carried over many tablets, grouped in numbered or lettered pages and divided into "volumes" or shelves, and even sometimes with the owner's book-plate (q.v.) attached, cannot be denied the name; nor can extensive compositions on papyrus like the 'Book of the Dead,' dating back well toward 2000 B.C. if not earlier, nor the famous 'Papyrus Prisse,' the oldest volume known to exist. The Babylonian and Assyrian books were drawn on clay tablets or polygonal cylinders (afterward hardened) with an iron stylus, producing the wedge-shaped or "cuneiform" characters, some of them so small and skilfully executed that they suggest the use of a magnifying glass—quite likely a ball of crystal. These about the 7th century B.C. had begun to be gathered into royal or temple libraries, to the inestimable service of modern historical research: the vast majority of our knowledge of old Babylonia and Assyria comes from two great libraries, that of Ashurbanipal (Sardanapalus: 668-626 B.C.) at Nineveh, and that of the Temple of Bel at Nippur. Yet, oddly, while our civilization as a whole is a direct heir of the Babylonian, and its details owe to that, through the Greek and Latin, a score of items to one of the Egyptian, our books have no connection with the Babylonian and are the immediate progeny of the Egyptian; an unbroken sequence can be maintained from the volume in the reader's hand to the 'Papyrus Prisse,' perhaps more than 2,000 years before Christ, and containing the still older composition, regarded as the oldest extant book in the world, the 'Maxims of Ptah-Hotep,' dating probably from 2500 B.C.

Owing to the cheap and easy preparation of the papyrus tissue, by pulping the pith and spreading it out to dry, essentially like our paper, and its wonderful adaptability to literary use beyond anything discovered for many ages,—its thinness and lightness, yet hard, smooth, glossy surface showing off inks and pigments so beautifully—its use spread to Greece before the time of Herodotus at least, and to Rome, and maintained its position as a book material down to the 10th century A.D. Ali ibn el Azhad in 920 describes the different kinds of pens required for writing on paper, parchment, and papyrus (see Karabacek's 'Das Arabische Papier,' 1887). Unhappily, however, it had one insuperable defect for laws, records, or whatever else needed perpetuity: it was very sensitive to dampness, and dissolved and crumbled away in a few generations. Hence it is not merely probable but certain that the great mass of classical literature is lost forever, disintegrated and gone with its material record. The only place where any considerable finds are still possible is Egypt, whose dry climate can preserve such things for countless ages, and whose libraries had vast quantities of the best Greek and Roman works: some remarkable discoveries

have already been made there, and more may be hoped for. But for this reason, papyrus was largely supplanted for public uses, and with the wealthier collectors or authors, or for very popular books, by parchment, fine dressed skin, the material used by the Jews, Persians, and other Oriental nations. When the book had outlived its popularity or a more exigent use was found for the parchment, which was costly, the former writing was rubbed off or in, and a new book copied on, and this process was repeated sometimes six or seven times. Thanks to the fact that the erasure always left the outline of the old characters possible to revive by certain chemicals, and that for clearness the new book was written crosswise to the old, so that the imperfectly erased words should not show up through and cause confusion, these *palimpsests* have yielded us many treasures supposed to have been extinguished.

As the very name "book" shows, however, paper-pulp and skin and clay were not the only materials used for books by the ancients; in fact, it would be hard to cite any common smooth-surfaced article not so used. Animal, vegetable, and mineral substances have all been drawn on; metals, wood, wax, ivory, leaves, bark, etc. Wooden books were common among both Greeks and Romans; part of one containing Solon's laws was preserved at Athens till the 1st century. For the more important purposes, laws and edicts, they employed (before the general accession of parchment) ivory, bronze, etc.; Hannibal engraved an account of his campaigns on bronze plates, which if they could be supposed existent, would be worth excavating all South Italy for, especially as the writing must have been in Carthaginian. The antiquary Montfaucon in 1699 bought at Rome a book of six thin leaden leaves, about 4x3 inches, with covers and hinges of lead; it contained Egyptian hieroglyphics, etc. For the common needs of business and social life, however,—contracts and wills, letters either of love or friendship, memoranda, etc.—the Romans used *diptycha* and *tabulae* or *pugillaria*—sheets covered with wax, to be written on with a stylus, and protected from contact by a raised margin, or opposite projections in the centres. Two of these, of date 169 A.D., were discovered early in the 19th century in Transylvania, and one of 1301 is preserved in the Florentine Museum. In the University of Göttingen is a Bible of palm-leaves, containing 5,376 leaves. Among the Kal-muck Tartars was found a collection of books made of long narrow leaves of varnished bark, the ink black on a white ground.

The shape of wooden and metal books, waxen and ivory tablets, and those of other hard substances, was square; but the thin flexible papyrus was too liable to dog's-ear and tear from handling in such form, and a method was adopted which has left deep traces on our book terminology—of rolling the sheets on wooden cylinders, very much in the fashion of a modern mounted map. They were written on one side only, fastened together at the edges, and glued or otherwise attached to the roller, which was called in Egyptian a *tama*, in Greek a *kulindros* (cylinder), in Latin a *volumen* (roller), our "volume." We still speak of a piece of writing poetically as a "scroll." Some of these were of huge size: specimens of Egyptian book-rolls still exist extending to 20 and even 40

yards (see Birt's 'Das Antike Buchwesen,' p. 439); but the great inconvenience of consulting such enormous sheets, and the injury to themselves in the process, caused the breaking up of lengthy literary productions into sections, each on a separate roll. Certain handy sizes became normal, like the ordinary novel or essay volume of to-day; and this conventional length of roll exercised great influence on the length of what are still called the "books"—that is, chapters—of the classical authors, one of these being about enough to make a roll or volume of. At each end of the roller was the *umbilicus* (navel) or *cornus* (knob), a boss to turn it by, and the volume was read by unrolling the scroll to expose successively the sheets or *paginae* (things "fastened" together). The title was generally written in red, on fine vellum, and pasted on the outside, which was dyed with cedrus or saffron. Much labor and expense was often involved in the ornamentation of books, and pleasant conceits were sometimes conveyed by their color. The practice of perfuming the pages to which Martial alludes, "When the page smells of cedar and mantles with royal purple," was not abandoned till very modern times. Lord Burghley, instructing the vice-chancellor of Cambridge concerning the proper presentation of some volumes to Queen Elizabeth, cautions him to "regard that the book had no savor of spike" (spikenard), "which commonly bookbinders did seek to add to make their books savor well." It seems an odd lure to book-buyers; but in this age we can hardly realize the important part played by perfumes in ages when pretty much everything and everybody smelt ill, when filth and the lack of washing or changing of clothes assailed all noses with evil stench, and an agreeable scent was one of the greatest and rarest luxuries of life. In Egypt the rolls were kept in jars holding nine or ten each; in Rome they were kept in wooden boxes or canisters, often of costly workmanship, or in parchment cases. The change from scrolls to *codices*, or square books, seems to have taken place generally in the ancient world after the adoption of parchment or vellum; they appear to have been coming into general use in Martial's time (last half of the 1st century A.D.), as he alludes to their advantages. The name *codex* is still used for the more important ancient MSS., as the "Codex Alexandrinus." Not all the parchments were folded or arranged in small square sheets as now, however: M. Santander owned a beautiful Hebrew Pentateuch written on 57 skins of Oriental leather, sewed together with threads or strips of the same material; it formed a roll of 113 French feet (120.45 English) long. And practically the same arrangement of successive surfaces had been enforced in the use of the clay or wooden tablets, from the nature of the articles. The form remained substantially unaltered throughout the Middle Ages, and being even more suitable for paper than for vellum, was ready on the invention of printing to facilitate its full development; though important differences in bulk, arising as well from the condition of the art and its materials as the fashion of the times, distinguish books of the earlier periods of printing from those of to-day.

Production and Prices (see also AMERICAN PUBLISHING).—It is assumed that until the invention of printing, books were of

excessive rarity and costliness. This is mostly true of the Middle Ages, when the only trained chirographers were in the monasteries—working at free will and leisure and caring solely for quality, and with the express object of making the books costly. It was not so, however, in classic times, owing to that society being based on skilled slave labor. From this cause, the greatest extremes of price prevailed side by side, extreme cheapness and almost incredible dearness. When but few copies of a book were made, either by an author of slender means or by a wealthy amateur to give to friends, they were either given away, or if sold might command any price an unexpected favor of a rich man's fancy dictated; and from the same cause "unique copies"—most likely such were the three books of Philolaus the Pythagorean, for which the not rich Plato paid about \$1,600, and the few books of the philosopher Speusippus for which Aristotle paid three Attic talents or some \$3,500—were much commoner than now. On the other hand, Anaxagoras' works could be had for a drachma (about 18 cents) even when dear—a thing the more strange that two pieces of papyrus for copying an account cost in 407 B.C. 2 drachmæ 4 oboli, or about 45 cents. Perhaps there was a difference in the paper. In this same year a *diptychon*, or pair of wooden account tablets (pass-book), cost a drachma; but in Demosthenes' time, three quarters of a century later, one (probably smaller) cost only two *chalci* ("coppers"), less than a cent. All these contradictions are probably due to the lack of any regular publishing market.

The long agonies of dissolution of the Roman empire annihilated the book trade; and for centuries the only makers of books were the monk scribes, in whom the important conditions of skill, leisure, love, and patience were all fulfilled. Learning had become the exclusive privilege of a class, a privilege of which they were at once proud and jealous; and they surrounded the means of its acquisition with a pomp and circumstance that precluded the multitude from familiarity with it. In the earliest times books had received the adorning aid of ornamental art; but in the Middle Ages they reached the acme, if not of beauty and convenience, at least of cost. The favored works of the time, principally of the Christian writers, were laboriously transcribed by patient penmen, in *scriptoria* liberally maintained in the monasteries, and specially devoted to that purpose. In the process of preparation their books received the most careful attention in regard to accuracy, elegance, and solidity. In the monasteries also the work was completed; for not only were the monks transcribers, illuminators, and binders, but the same individual frequently combined the triple function in his own person. From the hands of the scribe, whose solemn adjuration at the conclusion of his task was evidence not only of his own care but of his desire that others should imitate his example, the book passed to the illuminator, whose gorgeous colors still delight the bibliophile; and from him to the binder, by whom its ponderous proportions were encased in massive covers of wood and leather, studded with knobs and bands, often of gold and silver, and closed with broad clasps—to unfasten which, letting the covers swing open on their stout hinges, was a privilege to which

not every one was permitted to aspire. For, as said Richard De Bury, "laymen, to whom it matters not whether they look at a book turned wrong side upward or spread before them in its natural order, are altogether unworthy of any communion with books." Precious metals and the less crude but equally costly productions of art contributed to swell their value, in respect of which they stood at times on an equality with houses and lands. When publicly exposed, they were frequently secured by chains; they were protected by special statutes; were subjects of grave negotiation; solemnly bequeathed by will, and lent only to the higher orders, who were compelled to deposit ample pledges for their return. Even so late as 1471, Louis XI. was compelled by the faculty of medicine at Paris to deposit a valuable security, and give a responsible endorser, in order to obtain the loan of the works of Rhasis, an Arabian physician. Instances of the immense prices of special books are familiar, as of King Alfred's giving eight hides (perhaps 500 acres) of land for one book, but England was well-nigh bookless then; of the countess of Anjou giving 200 sheep and other articles for a book of homilies of a bishop—an enthusiastic lady might do so if she liked the bishop; and of other fancy prices for very fine books, not however more than modern collectors might for superb copies. The form in these cases often counted for more than the matter, just as now. On the other hand, in 1431, shortly before the invention of printing, Peter Lombard's works sold at Caen for 7 francs, or \$1.30, probably equal to about \$10 now; but he was the most popular and widely circulated author in the Christian world before Thomas à Kempis, and it was to the interest of the Church to multiply his works. Making all allowances, books were very scarce and costly.

Arrangement of a Book.—The first page or *recto* of the first leaf or "folio" is technically known as a *bastard* or half-title page; the next page or *verso* of the first folio is left blank. (The term "folio," however, as usually employed by printers, means simply page number.) Then follows the title-page proper, usually with a blank page at the back. In many books there intervenes a preface or introduction, a dedication, and a table of contents, before the main body of the book begins; the table of contents is sometimes before and sometimes after the introduction and preface. If any portion of the book is out of place, there are two ways by which the true order may be discovered. At the outer corner, or in the centre above the reading matter, or in pages with a chapter heading usually in the centre at the bottom of the page, is a numeral either Arabic or Roman—1, 2, 3, or i, ii, iii; the almost universal custom now is to use the Roman numerals for prefaces and introductions, and the Arabic for the body of the text, and in catalogues these are indicated thus: pp. xxxvii, 325—that is 37 pages introduction paged with Roman letters, and 325 of text paged with Arabic. As a guide to the binders in gathering the sheets, also, each "form" as printed on the press—the number of pages printed on one sheet, to be folded and cut later into the proper order of reading—has at the bottom of its first page a number or letter in sequence through the book; that is, if each sheet as printed has eight pages on it, then

pages 1, 9, 17, etc.—the *outside* sheet of each form, which lies on top and visible when the sheet is folded,—will have the numbers 1, 2, 3, etc., or the letters A, B, C, etc., called "signatures," to show the binder in what order the folded sheets are to be assembled. If the forms outnumber the letters of the alphabet when these are used, the signature series continues either as AA or 2A, etc. When two sections of a book begin printing simultaneously for expedition, and as it is uncertain where the first will end, the second has its page folios begun by guesswork—if the first runs over it is necessary to duplicate a certain number of the closing pages of the first section, as 480A, 481A, etc., or else to continue the closing number, as 496A, 496B, etc., or if only one or two, 496½, 496¾.

Sizes of Books.—The copyists made up their paper or vellum books by folding four, five, or six sheets and placing one within the other, making quires or gatherings of 8, 10, or 12 leaves, known respectively as quaternions, quinterns or quinternions, and sexterns, or in Greek tetradia, pentadia, and hexadia. The first printers adopted the same method, printing one page at a time and only on one side of the sheet; the register or collation of the quires for guide to the binder was given in the colophon (q.v. below), and only later supplanted by a signature on each quire, at first inserted by hand, and first printed at Cologne in 1472. When more than one page was printed at once, the number of times the paper had to be folded was a fair guide to the dimensions of the page, at a time when (and for ages later) the paper was made by hand, on frames whose size was held closely alike by the exigencies of human arms; and folio, quarto, octavo, duodecimo, etc., expressed not only the absolute fact of folding, but the constructive fact of size. These names were conveniently abbreviated, except the first, to 4to, 8vo, 12mo; and when improved machinery and larger sheets of paper enabled still more sheets to be printed at once, the Latin names to correspond were not used at all, the terms 16mo, 24mo, 32mo, being employed at once. All these names still survive, though—with the advent of great paper-mills and machinery which make any size desired for an edition, so long as it is an "engine run," the actual printing on large editions of 64 pages at a time, and minute calculations which figure to an eighth of an inch margin—they have ceased to express any fact worth knowing; and in the United States it is now more usual to give on catalogues the height and breadth of pages. But in Europe the old fashion still prevails. So far as the names now mean anything, a 16mo indicates the usual size of a popular volume or essay volume, and an octavo the stately and dignified memoir or volume of travel or "complete works" or cyclopædia; but in fact even these are rarely printed in less than 16s. A sheet folded in the middle forms two leaves or four pages; and a book composed of such sheets is styled a folio, whether it measure a foot and a half or four feet high. When the sheet is again folded it makes a quarto. In hand-made paper (that used in nearly all the small special editions and those of bibliographical interest) the water line runs either across or down the page, according to the number of foldings. The following scheme is serviceable: Folio, folded once, 4 pages, water line perpen-

dicular; quarto, twice, horizontal; octavo, four times, perpendicular; duodecimo, six times, horizontal; 16mo, horizontal; 18mo, perpendicular; 32mo, perpendicular; 36mo, 48mo, 64mo, horizontal; 72mo, 96mo, perpendicular. In Great Britain for a long period printing paper was chiefly of three sizes—royal, demy, and crown; and the book was large or small according to which was used. Demy was the commonest, and the demy octavo was the established form of standard editions. Among books as among men there are giants and dwarfs. The British Museum has the largest and the smallest in the world. The former is an atlas seven feet high, of the 15th century, completely concealing a tall man between the pages, with a binding and clasp which make it look as solid as the walls of a room; the latter is a tiny "bijou" almanac less than an inch square, bound in red morocco, easily to be carried in the finger of a lady's glove. Certain church books in the Escorial are described as six by four feet; and the "Antiquity" volumes of the Napoleonic 'Description de l'Egypte' are $37\frac{1}{2}$ inches high. The Thumb Bible or Toy Bible, on the other hand, was one by one and a half inches; it was not really a Bible, but an abstract, printed in 1693 and dedicated to the Duke of Gloucester, and repeatedly reprinted. Hoepli's 'Divina Commedia' (1878) is less than $2\frac{1}{4}$ by $2\frac{1}{2}$ inches; and Pickering's diamond edition of Tasso measures $3\frac{1}{2}$ inches high by $1\frac{7}{8}$ wide.

Colophons.—These originated with the Assyrian scribes in the 7th century B.C. at latest: Ashurbanipal's in the Nineveh library put at the end of the last column of their cylinders a register of the documents composing the "book." The early printers followed the same style, using the last paragraph of the last page—now called by English bookmen the colophon (Greek, apex or terminus), by French the *souscription*, by Germans the *schlusschrift*—to give details about the book, which we should now assign to the title page, or merely for a sort of *envoi* or "send-off." The usual terminus of books was "Explicit," "Hic Finis," "Finis," "Here Endeth," or something of the sort; but some printers expanded it into elaborate epilogues or postfaces. Caxton is notable for this; see examples in Blade's 'Caxton,' and for others see Legrand's 'Bibliographie Hellenique' (1885). With development of the title-page, the colophon disappeared, though instances are found well into the 16th century.

Title-Pages.—It is curious that while the early development of printing ran to enormous and elaborate title-pages, Caxton has none at all, except one to a work not certainly his, 'The Chastising of God's Children' (?1491); and even that contains only three lines of ordinary print. But in Venice as early as 1474 a 'Calendario' by John de Montereio was issued by Pictor, Loslein, and Ratdolt, with a quaint rhyming title-page, with place, date, and names at the foot. A facsimile is given in Bouchot's 'The Printed Book.' The treatment of the title-page has varied enormously with different periods. In the 16th and 17th centuries it was at its worst: the object apparently being to make it a digest of the entire contents of the book, (Nares' 'Life of Burleigh,' of which Macaulay says that "the title is as long as an ordinary preface," is a mild example in the 19th), and half destroying the very object of the title by

making it difficult to wade through and come at the real theme. Frequently it gave a laudatory description of the book, a plan which if adopted to-day would save the reviewers the trouble of reading the preface: "A Book Right Rare and Strange," "Very Necessary to be Known," "Very Pleasant and Beneficial," etc., are familiar to the student of early printing. Modern titles are thought to violate both good taste and good business judgment in going beyond a short plain sentence or name; but they sometimes do worse by misleading the cataloguer, as when Ruskin's 'Notes on the Construction of Sheepfolds' is classed among works on live stock. Double titles, as where a sub-title is given of a seemingly different purport from the main one, are also perilous. As to the frequent practice of reissuing an old book under a new title, it is pure fraud, wasting the money of libraries and private buyers on what they have already or do not want, throwing catalogues out, and making confusion all around. The punishment of using a title already appropriated, even unknowingly, is direct and by law, for the title of a book is protected by law as much as any other part of the contents. For the lore and facsimiles of title-pages, see Andrew Lang's 'Old French Title-Pages' in 'Books and Bookmen'; Le Petit's 'Principales Editions originales d'Ecrivains français' (1888); and Kónnecke's 'Bilderatlas' (1887).

Dating of Books.—One of the most exasperating traits of the early printers, like the monkish scribes, was its rarely occurring to them to put dates to their books. Only five out of 21 of the known works of Colard Mansion, Caxton's master, are dated, and more than two thirds of Caxton's own are dateless. On the other hand, in the colophon to the 'Moral Proverbs' and in the 'Book of the Knight of the Tower,' the dates are set down with excessive minuteness, even to the month and day. Modern publishers only fail to date a work when it is out of date and the fact is to be concealed from the buyer; a common deception of the trade is to reissue an old work with a new title-page and usually a new copyright date, sometimes shifting the introductory matter so as to change the pagination or "folioing." The usual and now universal date is either by Roman numerals (an antiquated annoyance it would be better to abolish), or by Arabic numerals, which for some inscrutable reason are held a trifle underbred. In the earlier books some queer freaks are indulged in. One is to put Roman lower-case numerals before some of the capitals as multipliers; unfortunately, others use exactly the same as signs of subtraction, and others still use capital letters as subtractors, so that the reader's guess needs confirming from outside. For example:

M CCCC iiijXX VIII (1498: $1000 + 400 + 4 \times 20 + 8$).
M iiijC iiijXX viij (1488: $1000 + 4 \times 100 + 4 \times 20 + 8$).
M iiijD (1496: $1000 + 500 - 4$).
M IID (1497: $1500 - 3$).

Sometimes the early printer used odd chronograms, or titles in which a date is expressed by the numeral value of the letters contained in or marked in it; in some cases repeating in this a date already given on the title-page. For instance, 'De spiritali Imitatione Christi saCræ et ViLles pIIs In LVCeM Datæ a R. P. Antonio Van den Stock Societatis Jesu, Ruræmundæ, Apud Gasparem du Pres'—a

book with two chronograms on 1658 in the title, but a superfluity in the centre, and containing in the text over 1,500 on the same date. Two modern volumes of chronograms are Hilson's (1882 and 1885).

The date is often determined approximately by the water-marks on the paper; but this is one of the most persistently forged of all things, and demands the greatest knowledge and judgment.

Place of Publication.—This is not always instantly apparent even when printed, as the various local forms and their varied Latinizations or the use of obsolete terms often make a bewildering complexity for a single place; or a punning or pseudo-classical translation may be used, not a true ancient form; or the same Latin or Greek form may mean one of two or three places; or it may be used expressly to throw the inquirer off the track. The latter is of course undiscoverable except by outside evidence, which however is forthcoming in a surprising number of cases. The motive may be anything from sincere religious or patriotic zeal to the most bestial criminality; most "shady" modern literature has either no assigned place of publication or a false one, and some are "published" an immense distance from where they are printed—a common enough thing in legitimate publication in modern times, though practically unknown in early ones, printer and publisher being the same. Hundreds of European books are nominally published at Pekin, or Tokio, or Calcutta; the unsavory products of Parisian presses are usually fathered on some Dutch or Belgian city; and Sir Richard Burton's unexpurgated 'Arabian Nights' was accredited to Benares, India.

The following list of un-English forms of the chief centres of past publication will be useful (for a full one, see 'Dictionnaire de Géographie Ancienne' (Paris 1870):

Argentoratum: Stras-	Gippesvicum: Ipswich.

Pontimussum: Pont-à-	(local dialect): Ven-
Musson.	ice.

Pagination.—Books were printed at first exactly like manuscripts, without numbering the pages. Soon the unhandiness of this method, and the difficulty of making references, forced a numbering of the leaves; which was shortly succeeded by numbering the pages, and in some cases—of very large, closely printed books—by numbering the columns, which is occasionally done for like reasons in modern times. Books of more than one volume are usually paged separately, but in many large sets the paging is carried consecutively from beginning to end, especially where it is likely to be issued in more than one edition and divided into differing numbers of volumes; since in that case one index will answer for all, instead of having to be made over for each. In the old folios and quartos, letters were often inserted on the margin, to break the page or column into separate portions without interfering with the continuity of the text; these marginal references from the first editions of classics are often left in the modern editions, forming a convenient method of reference from one to the other. Essentially the same method is followed in some modern books, but usually by numbers instead of letters, dividing off the text into tens and fives of lines, for convenient citation and reference; in some editions of the Bible the chapters and conventional verses are marked off in the same way, to keep the original paragraphing and continuous narrative and yet be easy of comparison with the common Bibles.

Prefaces, Dedications, etc.—An introduction is properly a part of the body of the text, outlining its theme and the main divisions of the argument or narrative, or setting forth the general conditions from which the special theme is isolated and enlarged for study; the *preface* (for which among certain ultra-Teutonists the disagreeable affectation "foreword," German *Vorwort*, is substituted) is properly the author's introduction of himself or his work to the reader, explaining his general purpose, the need or place of his book, personal thanks, or comments, etc., and all such matter as needs to be stated yet is not pertinent to the exact subject. In old times it was like the prologue or epilogue to a play, a method of ingratiating one's self with the reader, bespeaking his indulgence or removing any unfavorable impressions with which he might begin the book; and was addressed to the "courteous reader" or the "gentle reader" (which properly meant an assumed feminine reader), etc. The *dedication*, in times

when there was no general book-market and an author must depend on the patronage of some person of rank (that is, down to the 18th century, and well into that), was an integral and indispensable part of the book: it meant that the author asked the patron to give him money and place in return for being celebrated, just as the old chiefs did their bards. He must have his *Mæcenas*; without him he would starve, with him he could disregard the masses. Sometimes, with men of hard, bold natures and a keen scent for the worst side of human life, like Martial or Aretino, they used disguised (very little disguised) threats and virtual blackmail as a supplement to appeal, and fawned and snarled alternately. In those times it was often nauseous with fulsome laudation; it is now of the simplest form, a mere survival used to express the author's liking or gratitude for some one, or acknowledgment of inspiration or encouragement, or in humorous books often a joke like the text.

Printers' Emblems.—These are the "book-plates" of the publishers, used not to imply ownership of the copies, but the credit of the work. They have been treated by Berjeu in 'Early Printers' (1866), by Silvestre in 'Marques Typographiques' (2 vols. 1867), and there was an old work of Roth-Scholtz (Nuremberg 1730); it has also been touched on by John Hill Burton in his 'Book-Hunter.' Among them may be cited the three-masted ship of Mathis van der Goes of Antwerp, 1472-94; the windmill of Andrew Myllar, Edinburgh, 1508 and later; the curious wild men and fruit-laden tree of Thomas Davidson of Edinburgh, in 1541; the Stephenses' olive-tree, and the Elzevirs' sphere. Often there is a punning allusion to the publisher's name: Froschover (*frosch* in German is frog) has frogs; Le Chandelier, a seven-branched candlestick; and Nicholas Eve has a picture of Eve giving Adam the forbidden fruit. Others use instead the armorial bearings of their cities: Leeu, the castle of Antwerp; R. Hall, Geneva's half-eagle and key on a shield; Stadelberger, the lion rampant of Heidelberg, and the diapered shield of Zurich. Ascensius, 1462-1532, has a most vividly accurate representation of his great printing press, with a pressman pulling a proof. His device bore the inscription, "Prelum Ascensianum"; and it was adopted by Jossé Bade of Paris, 1501-35, who added his initials at the foot; by De Gourmont, 1507-15; Le Preux, 1561-87; and in a modified form by De Marnef, 1567, and De Roigny, 1565. The Aldi had an anchor and a dolphin, which was employed by Turrisan, De Cheney, Brillard, Tardif, and Coulombel—sometimes, as in Coulombel's case, with the divided Aldus.

Decoration.—Besides the illustration of the text by pictures, either as frontispiece or interleaved, there are certain artistic forms which are merely decorative accessories to the book as such. The title-page may have some of its lines or letters printed with colored inks; the printer's emblem or some suitable vignette may be inserted; or even the whole title may be engraved, as often in the 16th and 17th centuries, when it was frequently an exceedingly elaborate and costly affair, and in some modern *éditions de luxe* these engraved title-pages are works of extraordinary beauty. There are also ornamental initials, as with the illuminated manu-

scripts; head and tail pieces, in the blank at the head of a chapter or the space left at the end. The first printers often left the initial letters off altogether, or put in a small one as a guide to the artist, who inserted them by hand, using red ink, from which he was called a *rubricer*; he also used his taste in other decorative details, being in fact the illustrative artist of the time.

Technical Terms.—The sale and collection of books are too large subjects to be treated here, but a few of the names used in the second-hand book trade may be mentioned. "Unique," "rare," and "very rare," are intelligible as names, but need judgment in their acceptance. A book may be unique because it was not worth keeping, like disused text-books; the term does not imply any special value. Or it may be so because the original edition was limited to enhance its value, a very common device. In all such cases there must be knowledge and sense to estimate properly the intrinsic or factitious worth of the book. "Edition" means nothing whatever; properly it should mean all the issue of a book that the publisher thinks the market will bear at one time, and once it did mean that, but it has long ceased to have any definite connotation. As above, the "edition" may be artificially limited to a small number of copies with a promise to destroy the plate; on the other hand, a popular novel may sell many thousands and each thousand be called an "edition," so that it may be said to have passed through 50 "editions." "Thousand" is the honestest word, and is now more used by the large houses. "Curious" is a euphemism for a much less dainty word. "Foxed" means damaged by brown or yellow spots. "Uncut" does not mean that the leaves have not been opened with a paper-knife, but that the original size of the leaves has not been cropped by the binder. The French use *non coupé* for the former, and *non rogné* for the latter.

Book Club, a private association printing books for a limited number of subscribers. The members are usually learned men, and in this way render accessible rare books and manuscripts. The earliest of these clubs was the Roxburgh Club, whose work was not important. Other English clubs of this sort have done excellent and valuable work, among them the Camden Society, whose publications relate to English history, the Percy Society, the Hakluyt Society, and the Early English Text Society.

In America there were in Colonial and Revolutionary times a number of literary societies which published the writings of their own members; such was the Junto founded by Franklin. The first association established for the purpose of publishing was the 'Seventy-six Society formed in 1854, whose publications relate to the American Revolution. This society existed for three years only, and was followed by "The Club" in New York, and by the Bradford Club. In 1858 The Prince Society of Boston was established, and it still continues its work of publication. From 1858 to 1876 a large number of clubs were formed whose work was neither important nor valuable. In 1876 the Brooklyn Historical Printing Club was established. It has done most excellent work on historical lines. The foremost of all American clubs of this sort is the Grolier Club of New York, formed in 1884 with 50 members, now numbering about

400. Its publications are of a literary and bibliographical character and are noted for their elaborate and artistic make-up.

Book-lice, wingless members of the family *Psocida*, order *Platyptera*. These minute insects would be easily mistaken for aphides, both the wingless as well as the winged individuals. Their bodies are oval, the head free from the prothorax, which is small and partially concealed by the unequal wings. The eggs are laid in patches on leaves, bar, or other objects, and are covered with a web. *Atropos divinatorius* is a small pale, louse-like insect, seen running over books and in insect cases, where it does considerable injury. It is one of the worst museum pests, especially injurious to the smaller lepidoptera. The same habit is also possessed by the well-known *Psocus domesticus*. Another species of atropos, probably *pulicarius*, has been found in Missouri, infesting the egg-mass of the cottony maple scale (*Pulvinaria innumerabilis*). See DEATH-TICK; DEATH-WATCH.

Book-scorpion, or **False-scorpion**, an arachnid animal of the family *Chernetida*; known by its large maxillary palpi, like the scorpion's claw. The abdomen is 11-jointed, flattened, without any appendage, and the living forms are minute; they breathe by tracheæ. They are found running about dusty books and in dark places and feed on mites and Psoci. They are often found attached to the leg of some fly or other insect by which they are transported about. The female chelifer bears the eggs, 17 in number, in a little bunch under her abdomen. Meuge has observed a pseudo-scorpion cast its skin in a light web made for that purpose, where it remained five days in the web after its metamorphosis, and did not assume its dark colors for four weeks; three months after it returned to the same web for hibernation. Meuge describes eight species from the Prussian amber, belonging to genera still living, and Corda one (*Microlabris sternbergi*) from the coal formation in Bohemia, an inch long. Schiöde has found a curious blind species in the caves of Adelsburg, and several kinds occur in American caves. In chelifer there are no eyes. *C. cancrroides* is dark brown, with many short spines on the thorax.

Book-selling. The earliest history of book-selling is extremely obscure. The tablets and cylinders of Assyria and Babylonia will be found treated under Book, and the article BOOK OF THE DEAD should also be consulted. About the middle of the 6th century B.C., is found in ancient Athens an approximation to a systematized book-trade as it has been understood in modern times. Pisistratus, with funds from the municipal treasury, paid scholars for preparing a standard text of Homer and Hesiod for copyists' use. The books then made were very costly. Diogenes Laërtius states that for three books of Philolaus (q.v.) Plato paid three Attic talents (\$3,240), money being then, of course, worth far more than it now is. The first book-sellers prepared by their personal labor the scrolls they sold; then capitalists came to employ and organize staffs of copyists. About 250 B.C. Alexandria became one of the great book-centres of the world. In this it was favored by having at its disposal the scholars of the university and the facilities for distribution which the commerce of Alexandria afforded. Skilled scribes were also

carefully trained there. The book-trade of Rome commenced about the 2d century B.C. Slaves who could write Greek were rated highly. The great publisher of Cicero's time, Atticus, is well known. His editions were famed for their accuracy under the name *Ἀττικὰν*. In addition to his central publishing house he had distributed in various portions of Rome and in provincial centres, tabernarii, or retail dealers. Horace's publishers were the Sosii in the Vicus Tuscus. Argiletum, Martial says, was the street of the book-sellers, as it was, likewise, of the tailoring shops of fashion. By the close of the 1st century A.D., the Roman book-trade was extensive and well organized. Papyrus was imported in great quantities from Egypt, and large staffs of copyists were kept busy preparing editions of various works, the average edition for the general public running from 300 to 1,000 copies. Very considerable shipments were made to the provinces.

During the Middle Ages book-making and selling belonged to the monasteries. The different monasteries transcribed the particular manuscripts treasured in their libraries, and their editions came to have a peculiar value, depending upon the character of the original text and the accuracy of the copy. At the beginning of the new learning, the manufacture and sale of books passed to the universities, within which the manifolding of MSS. was done by an organized guild. Outside the universities, however, there was a considerable trade in MSS., beginning with the end of the 14th century. The invention of printing naturally revolutionized the book-trade. The publications of Gutenberg, Fust, Froben of Basel, Aldus Manutius of Venice, Estiennes (Stephani) of Paris, Caxton of Westminster, Plantin of Antwerp, and the Elzevirs of Leyden and Amsterdam, are well known. For further information, see the article BOOK, above referred to; and AMERICAN PUBLISHING.

Book-worm, the "book-worm" of librarians is probably the larva of a boring beetle (*Anobium panicum*) one of the family *Ptinida*. These worms are small white grubs like those of weevils, which live in various drugs, dried meat, etc. It also burrows in hard biscuits, resulting in the weevily biscuits complained of on ship-board. It more commonly bores in old furniture, causing it to be "worm-eaten." These grubs become the beetles known as "death-ticks" or "death-watches" (q.v.). See the various works on entomology and Blade's 'Enemies of Books.'

Book of Days, The, a noted work edited by Robert Chambers, 1863. It has for its subtitle 'A Miscellany of Popular Antiquities in Connection with the Calendar.' In bringing it out the editor expressed a desire to preserve interest in what is "poetical, elevated, honest, and of good report, in the old national life"—recognizing the historical, and even the ethical, importance of keeping this active and progressive age in touch with obsolescent customs, manners, and traditions. Beginning with 1 January each day of the year has its own curious or appropriate selection, and its allowance of matters connected with the Church Calendar,—including the popular festivals, saints' days, and holidays,—with illustrations of Christian antiquities in general.

Book of the Dead, The.—The literal translation of the hieroglyphic title is: "Coming

PERT EM HR—U

Forth by Day." Modern Egyptologists have adopted the name given by Lepsius: *Das Aegyptische Todtenbuch*, "The Egyptian Book of the Dead." That title, however, is considered unsatisfactory, for the simple reason that it is not one single book dealing exclusively with funeral ritual, but is a collection of books and chapters treating of psychostasia in the "Double Hall" before Osiris; the peregrinations of the *Ka* in the "valley of the shadow of death;" the Osirian doctrine of resurrection, etc.

No better laconic definition of the Book of the Dead can be given than that of the late Sir Peter le Page Renouf. He says: "It is not a book in the usual sense of the word; it is not a literary whole, with a beginning, middle and end; it is a mere unmethodical collection of religious compositions (chapters) as independent of each other as the Hebrew Psalms."

Part of the Book of the Dead is of remote antiquity, dating back to the pre-dynastic period. There are numerous late copies of it in the museums of Europe and of this country, but the best and most complete copy is the Papyrus Ani, in the British Museum. It contains one hundred and eighty-six chapters, and is beautifully illuminated; and, although about 3,400 years old (belonging to the XVIII Dynasty), it is well preserved. A fac-simile of that Papyrus was published by order of the trustees of the British Museum, and translated (1895) by the eminent Egyptologist, Dr. E. A. Wallis Budge. Several excellent translations have been made into French, German, and English of various papyrus of the Book of the Dead. There are several versions of the book extant. That of Heliopolis, which was subjected to numerous modifications and recensions, is considered the most ancient; then the Theban version of which the Papyrus Ani is an example—dating from the middle of the XVIII Dynasty. These two versions are written in hieroglyphics, in vertical columns and in cursive linear style. Two other versions of a later period are written in hieratic as well as in hieroglyphic characters. Complete translations of the Book of the Dead were made by Birch, Brugsch, Pierret, Pleyte, Massy (Davis, from the French translation by Pierret), Le Page Renouf, and Budge.

The style of writing and the vignettes, representing embalming, funeral processions, weighing of the heart, etc., have undergone great changes in the course of time, and the texts of some of the Theban school in the XVIII Dynasty differ materially from later productions; i. e., the Papyrus Ani (Theban recension), contains one hundred and eighty-six chapters, and the Turin papyrus, of a later period, contains only one hundred and sixty-five chapters.

The late Sir Peter le Page Renouf, for many years keeper of the Egyptian antiquities in the British Museum, says: "Out of many manuscripts which are extant, no two contain

exactly the same chapters or follow exactly the same arrangement."

The earliest texts, before the XVIII Dynasty, are fragmentary, inscribed on the walls of tombs, monuments, sarcophagi, mummy cartonnages, etc. The plate is one of the numerous presentations upon the walls of the Egyptian tombs of that period, many of which have been faithfully reproduced in the magnificent volumes of the Description de l'Egypt, and in Lepsius, etc. It represents part *a* of tomb XXIV, now in the Sepulchral Chamber of the Royal Museum, Berlin, showing Prince Merab, son of Khufu, the builder of the great Pyramid of Gizeh (about 4000 years B.C.) enjoying himself after his beatification with the same good things he was accustomed to have in his former life.

The sum and substance of the Book of the Dead is chapter CXXV, generally considered the most ancient. It is always connected with a vignette, which depicts the beatification of "The Osiris," in the presence of the presiding deities in Amenti, when the "Negative Confession" and the weighing of the heart of the dead before the supreme deity in the netherworld takes place.

Before proceeding with the description of *psychostasia*, it is necessary to say a few words concerning the deities taking part in the weighing of the heart in the supreme tribunal of Osiris, called "The Double Hall," represented in this plate.

The name which every dead Egyptian assumed was that of the chief deity of Amenti, called "Osiris." As Osiris was considered the type of life after death, it was only natural that in the development of their mythology he should become the chief god of Amenti—the Justifier of the dead.

Osiris, according to Egyptian legend, was a prehistoric king, the embodiment of goodness. His brother, the wicked Set, becoming envious, treacherously killed him, cut the corpse in pieces and hid them in different parts of the land. Osiris' sister-wife, Isis, accompanied by her sister Nephthys, collected the scattered parts, which were then embalmed by the god Anubis. By means of magic, which Thoth, the god of letters and science, taught Isis, she resuscitated the body. Finally, Horus, son of Osiris and Isis, avenged the death of his father, by engaging Set, or Typhon, in combat and killing him. In the course of time Isis, Horus, etc., came to be considered as gods, and Osiris became identified with *Tum*, the setting sun, symbolizing death; and Horus on the horizon (Her-em-khu, sometimes called Her-em-Khuti), the type of birth and resurrection.

Thus the *Ka*, whilst wandering through the regions of darkness and molested by demons, is the dead Osiris. After the weighing of his heart and if found not wanting, he is beatified and obtains new life. He is no more Osiris the dead, but Osiris Horus, the resurrected.

Plate *b* represents the weighing of the heart in the tribunal of the netherworld, *Amenti*: presided over by the supreme deity Osiris (Auser). On the extreme right and left of the hall are two massive pillars, carved to imitate bundles of lotus stalks, fastened together near the top of the column. The deceased at the entrance to the hall is in an adoring attitude; his uplifted arms are supported by *Maat*, the goddess of truth and justice. She is always

present in the Judgment Hall and is represented headless, with an ostrich feather in place of the head. Her figure, sometimes only the feather of her headgear, is placed in the scale-pan, opposite the one containing the vase with the heart.* The jackal-headed Anubis and the hawk-headed Horus superintend the weighing. In the scale-pan to the right is the weight in the shape of the goddess *Maat*. This scale is adjusted by another divinity un-named in the hieroglyphic text. In the scale-pan to the left is a jar containing the heart of the departed. Upon the beam of the balance sits the dog-headed ape deity called *Hapi*. The little figure seated on the crook to the left represents the new birth after the justification of the "Osiris." Close to the balance stands the ibis-headed scribe *Thoth*, with his tablets, recording the result of the weighing. Close in front of him, upon a shrine, sits the adversary (the Egyptian *Cerberus*), called in hieroglyphics *Amemit*, the devourer of the dead, in the shape of a strange being composed of three beasts: hippopotamus, lion and crocodile, ready to destroy the *Ka* in case he should, after weighing, be found wanting. Immediately facing the throne is an altar full of sacrifices, consisting of bread, geese, onions, lotus flowers, buds, and burning incense. Beneath the altars are jars containing wine and other liquids for oblations. At the head of the hall is Osiris himself, sitting upon a throne which is richly decorated with *ankhs*, emblems of life, and *uas*, emblems of purity. He is closely shrouded, and wears the white crown of Upper Egypt, called *Atef*, ornamented with two ostrich feathers, the symbols of truth and justice; his hands crossed upon his breast, on his wrists are bracelets. He holds in his right hand the *Nekhkek*, scourge; and in his left, *Hek*, the crooked staff, symbolical of justice. Above are the forty-two divine assessors, seated in two rows of twenty-one each, with different type of head, such as the heads of apes, serpents, crocodiles, etc., adorned with the feather representing truth and justice, and each holding in his hand a sharp-pointed knife. The *Ka* of the deceased stands, in beseeching posture, with hands raised, in front of each row of the judges.

The same chapter (125) contains the confessions of the deceased. Every one of the forty-two judges whom the deceased called by their proper names had to pronounce him innocent, he emphatically affirming before each of them in turn that he did *not* commit any of the forty-two sins. The negative confession is very interesting but space forbids the mentioning of more than a few of them. The judge having to consider the crime of theft was addressed by the deceased as follows: "O Devourer of Shades, coming out of the orbits . . . I have not stolen;" another was addressed: "O Eyes of Flames, coming out of the shrine . . . I have not played the hypocrite;" "O Cracker of Bones, coming out of *Suten Khem* (Bubastis) . . . I have not told falsehoods;" "O Swallower, coming out of *Khnem* . . . I have not blasphemed;" "O Eater of Hearts, coming out of the thirty . . . I have not made conspiracies;" "O Eye in the Heart, coming out of the land of *Sahu* . . . I have not defiled the river," etc.

* Many of the Pharaohs adopted her name in their royal titles, *i. e.*, Ramesis II styled himself *Se Ra Usur Ma*, "Son of the Sun, the Keeper of Truth."

Among other sins denied are: "I am not sluggish; I have not made to weep; I am not a landgrabber; I committed not adultery; I am not a slayer of man; I tamper not with the balance; I do not cheat," etc.

Howsoever absurd the Egyptian Pantheon may appear to our eyes, we must acknowledge from the evidence of these forty-two confessions, that they possessed a superior code of morality, a code which included not only our decalogue, but much of the ethical teachings and humanity of modern civilization.

The vignettes of this chapter, as we have already remarked, vary. The finer illuminated papyri made for royal personages or high priests and priestesses are exquisitely illuminated and the texts are unabridged. For instance, the Papyrus of *Nu* is more than sixty-five feet long. The Papyrus of *Ani* is seventy-eight feet long by one foot and three inches wide.

Most copies of the Books of the Dead are defective, others betray gross ignorance on the part of the scribe or copyist. The common people who were unable to purchase a well-written and illuminated text for their dead had to be satisfied with a cheaply, badly written, abridged copy. The scribes must have possessed a large stock of blanks on hand, containing spaces to be filled with the deceased (Osiris') name. Some of the Egyptian scribes were as dishonest as most of the embalmers. As the papyrus was to be placed with the mummy, the mercenary scribe or embalmer substituted a spurious for a good one.

SAMUEL A. BINION,

Author of 'Ancient Egypt or Mizraim.'

Book of Mormon, a collection of 16 distinct books professing to be written at different periods by successive prophets. Its style is an exceedingly clumsy and verbose imitation of that of the common English translation of the Bible, portions of which, to the number in all of 300 passages, are incorporated without acknowledgment. It constitutes the scriptures of the members of the Church of Jesus Christ of Latter-Day Saints. Joseph Smith, an American, of Manchester, N. Y., professed to have heard in 1823 the Angel Moroni reveal to him in visions that the Bible of the Western Continent was buried in a box near his residence. This, according to his own account, he at length found—a volume six inches thick, with leaves of thin gold plate, eight inches long by seven broad, bound together with three gold rings; on which leaves was a mystic writing that he characterized as reformed Egyptian. With the book he professed to have found a pair of magic spectacles, by means of which he was able to read the contents, which he dictated to an amanuensis. This book consists of an alleged history of America from 600 B.C., when Lehi and his family (descended from the dispersion after the building of the Babel tower) landed in Chile. Between the descendants of Nephi, Lehi's youngest son, and the offspring of his older brothers, who are the North American Indians, long conflicts waged: the Nephites finally being almost annihilated. There remained a fragment, among whom were Mormon and his son, Moroni. They collected the records of their people, and buried them in the hill of Cumorah, on the Divine assurance that they would be found by the Lord's prophet. Besides this history, the book, as it finally was received, has various moral and religious teachings. The real

MERCHANT KENNA JUSTIFIED

JUDGMENT OF THE DEAD.

BOOK OF NONSENSE—BOOKBINDING

history of it is as follows: Solomon Spalding, an eccentric Presbyterian preacher, wrote a historical romance in 1809, which a compositor, into whose hands it fell, sold to Smith. This was, in substance, the 'Book of Mormon,' which Smith issued, and to which various additions have since been made. See MORMON.

Book of Nonsense, A, a nursery classic by Edward Lear. It is made up from four minor collections published at intervals during a long life. The author began as an artist; colored drawings for serious purposes were supplemented by others for the amusement of the groups of little ones he loved to gather around him; and the text added to them has proved able to endure the test of time without the aid of drawing, and much of it has become part of the recognized humorous literature of the language.

Book of Snobs, The, a series of sketches by William Makepiece Thackeray. It appeared first in 'Punch,' and was published in book form in 1848. The idea of the work may have been suggested to Thackeray when, as an undergraduate at Cambridge in 1829, he contributed to a little weekly periodical called the 'Snob.'

Bookbinding, the art of arranging, fastening together, and covering sheets of paper composing a book, including the ornamentation or decoration of the covers. Following the use of rolls of papyrus or wax-covered tablets, leaves of parchment were introduced, and it became necessary to fasten or bind them together. This improvement in form is, on somewhat doubtful authority, attributed to Attalus II., king of Pergamus, about 150 B.C.

The monks were the early bookbinders, up to the time of the invention of printing, and examples in the British Museum dating as far back as 700 A.D. illustrate the great labor bestowed on their most precious manuscripts.

All the early specimens were bound in heavy boards, strong metal clasps, and bands, and the material used in covering varied from the parchment and iron to ivory, enamels, and jeweled silver and gold.

The invention of printing made a great change in the art of bookbinding, the delicate, beautiful specimens, the workmanship of Jean Grolier and many nameless Italian and French binders employed by Grolier, Macoli, and others contrasted strikingly with the rather clumsy, inartistic work of the monks.

It was not until 1820 that cloth was introduced as a covering, invented, it is said, by Archibald Leighton, one of the most enterprising and successful of London binders. In the 'Bookseller' of 4 July 1881 there is an interesting account by Robert Leighton of the invention of cloth by his father. The embossing of bookbinding cloth was suggested to the late Mr. de la Rue, and was carried out so admirably by him, with the appliances he possessed for embossing paper, that his process remains comparatively unaltered. The desired pattern was engraved on a gun-metal cylinder, and transferred in reverse to one made of compressed paper, strung upon an iron spindle, and turned in the lathe the exact circumference of the gun-metal one, and these two being worked together in a machine, and the pattern transferred from one to the other, the cloth was passed between them and received the impress of the pattern.

Extra work and edition work are the two classes into which bindings may be divided. Extra work bound with greater care, and largely by hand methods, forming a small portion of all books bound. Edition work being the binding of quantities, principally by machinery.

The following description will apply to extra work, and methods in vogue do not differ greatly from the process of hundreds of years ago, although the use of the press and plow, hammer and backing boards is giving way to the trimming, smashing and backing machines. The first process takes the sheets from the printing press, folds them in sections of 8, 16 or 32 pages, done generally by a girl pressing each fold down with a bone folder in such a manner that the pages come in consecutive order. If a book contains 320 pages it will be seen that 20 sections or signatures are required to complete it. When all the sections are folded, they are gathered up in order and collated, that is, examined to see that each signature follows in proper sequence. Smashed or hammered, the book is then ready to sew.

Throughout the world in binderies given up to extra work will be found a frame of peculiar make called a sewing-bench. On this is stretched bands or cords of soft twine in a vertical position, and to these the signatures are attached by passing the needle and thread through the middle of the signature and around each band or cord, and the raised bands showing on back of book inform how many cords the book has been sewn on, although in many cases grooves are sawed in the back of the book into which the cords fit, and false bands are pasted on back to show the raised band effect.

The book is taken down from the sewing bench and an inch or more of twine is left on each side to be later laced through holes punched in the boards. Before this is done the marble or colored linings are pasted on the front and back of book inside the first fly leaf. Leather or cloth joints in some cases are added.

The book is then trimmed in a cutting or trimming machine; formerly the edges were trimmed by a knife called a plow while the book was clamped firmly in a press. Before cutting the back is struck forcibly against an iron plate, to square up the signature, then placed against gauge, set to position desired and clamped, knife descending and cutting book while under pressure. After trimming the three sides the book is again carefully knocked up and a thin coating of glue, sometimes flexible in character, is well rubbed in between signatures, for unless this is done the signatures will show a tendency to split open, where one signature joins another. The book is then rounded by drawing or shaping the curve, at same time beating in a peculiar manner with a flat-faced hammer, then clamped in pair of jaws, and the joints drawn over by repeated taps of hammer, or in some shops by a heavy roller set in a machine called a backing machine, which clamps the back under treadle movement. Many extra forwarders round the book before trimming, then knock the round out. After cutting, the book will spring back to its former round, leaving the front concave. In most particular classes of work the boards are laced to book before it is cut. The book is now laced to boards forming the cover and the ends of cords glued down on

BOOKBINDING

the inside of the cover. If the edges are to be marbled, gilt or colored, they must go through that process before books are rounded.

Marbling.—Prepared colors are thrown in a shallow trough containing gum tragacanth, on which the colors float and spread as desired. The pattern is formed by various combs that mingle the colors. The edges of the book are dipped into the liquid just deep enough for the colors to adhere, and when removed from trough, a sizing is drained over the edges, removing the surplus gum and fastening the colors more securely to edge. After edges are thoroughly dry they may be burnished with an agate or stone burnisher. Gilding is done by laying thin sheets of gold leaf on the edges of books previously scraped and smoothed with steel scraper and fine sandpaper, and sized heavily with a preparation of white of egg. When dry it is then burnished with bloodstone, flint and agate burnishers.

Colored Edges.—Mix aniline colors with alcohol, adding a little ammonia to drive color in, spread over surface of edges with a fine sponge. If desired, then clamp in press and burnish. The book is then ready for the headbands, linings and cover. The headbands are merely ornamental, and are woven with a colored silk, by machine or made over cords with muslin. The older process was to work over a piece of parchment with colored silks and partially fasten to back of book in the weaving or sewing. The back is then lined with strong paper glued on, the amount of stiffening varying with the size of book and style of binding, most books being made with loose backs on which false bands are glued.

Coverings.—The leather cover is dampened and covered with paste, then drawn smoothly over and turned in, over boards which have previously been laced to the book. After leather has dried, clean out joints and paste against covers the lining papers.

Finishing.—Artistic taste of the highest order finds employment in this branch of bookbinding, and an expert finisher must be at once artist and craftsman of much ability. The ornamentation and lettering of fine bindings all are done by hand, the finisher bringing into use many tools and ornaments, cut on brass and fastened into small wooden handles, much depending on the manner of cutting and shaping the tools. The leather must first be prepared with paste wash and a glair or sizing generally made from the white of an egg, over which the gold leaf is laid, and the tools which are heated over a gas burner are then impressed on the gold leaf, the surplus gold being brushed off with a piece of crude rubber. Upon the most careful preparation of leather, the proper heat of tools, and the tooling of book before sizing is too dry, depend the brilliancy or gloss of the impression.

Ornamentation without gold is called "blind tooling" and is produced by rubbing or stamping the hot tool on the dampened leather. Few books bound now have such a wealth of ornamentation and so great an amount of time given to the finishing as was common in Grolier's time, although there are still many novel effects produced by the use of inlaid colored leathers, incised leather, etc.

After the period of Grolier, the taste for magnificent binding in France ran riot and

many indulged in most sumptuous bindings, and designs were prepared under the superintendence of the most celebrated artists.

During the 16th and 17th centuries bindings were produced in England which compared favorably with the contemporary masterpieces of French, Italian, and German bibliography, but in the 18th century England took the leading place in the workmanlike forwarding and artistic finishing of books.

EDITION WORK.

So slow was the process of hand folding, 2,500 signatures of three folds being a fair day's work, a single sixteen folding machine was built with steel points set about fifteen inches apart, over which the sheet is placed, registered exactly on the points, or holes punched into the sheet as it was being printed, a knife descending makes first fold, carrying through rollers to gauges, when the second knife drops, forcing sheet through second roller, and third knife likewise, making three complete folds, and dropping them in a trough at the rate of ten thousand a day, or in other words, one machine doing the work of four hand folders.

It was soon found possible to build double 16-folding machines doing nearly 20,000 sheets daily, and at present in some of the larger edition binderies, special machines have been built which will take a sheet nearly 40 x 60 inches in size, and will turn out 40,000 signatures of 16 pages each, equivalent to the work of 16 girls folding by hand.

When the books are found complete, they are put through a powerful machine called a smashing machine, which compresses and makes solid the book, then to the sewing machine, where each signature in turn is laid over the arms, is carried to a position under a row of curved needles, punches concealed within the arms first make an incision through which the curved needle carries a thread meeting a looper which fastens each stitch. The first and last sheet is pasted before they are placed over the arms, and when finished the book is cut apart from the following book, and the thread is held by the pasting of signature, from unraveling.

Following the sewing, books are re-smashed, the linings and cloth joint pasted in and books are ready for trimming. If it is to be marbled or gilt, the back is tipped with glue to keep the signatures from getting out of square or becoming irregular.

Trimming.—To remove the rough and uneven edges of the signatures, the book should be cut or trimmed. This may be accomplished in the straight cutter, a machine using one knife which, making a clean, smooth cut, descends while book is clamped, in some machines with a hand clamp, in others, automatically. This machine, while very satisfactory in its results, has given way for the trimming of editions of books to automatic trimmers of various makes, which, unlike the process of trimming in the straight cutter, trims the edges of the top, front and bottom of book without removing from machine. An improvement on the automatic trimmer is a machine using two knives with each cut of machine, and while the output of this machine is very large, there has just been installed in one of our large school-book binderies, a continuous cutter which permits the books to be

BOOKKEEPING

constantly fed into the machine, and the output is so large, the machine is in a class by itself.

After trimming and gilding, marbling or coloring, it is glued over back with thin coating of glue well rubbed in between the signatures to prevent the breaking between signatures, which, while not taking from the strength of binding, looks as if poorly bound; just before glue is dried too thoroughly, book is fed against the gauges of the rounding and backing machine, the front rolls of machine drawing or rolling the round under pressure, then carried to back part of machine where a backing plate rotates against the back and forms the joints. This machine will do the work of six to eight men.

After the process of rounding and backing, headbands are prepared by forming muslin over a cord or twine; the backs of books are thoroughly glued, headbands affixed at top and bottom of back, crash lining cut to extend about one inch or more over the joints, is rubbed on with a bone folder, heavy manila paper is then glued against the book and well rubbed in, after which books, when thoroughly dried, are ready to case in, or in other words, put in the covers which have previously been prepared.

Boards called binder's boards are cut in rotary cutters to proper size for books; cloth is cut sufficiently large to overlap about one half to three quarters of an inch, and fed over a cylinder which, revolving, carries it against glue rollers, which place a thin coating of glue thereon. This glued piece of cloth is carried to a certain part of machine and awaits the laying thereon of boards and strip of back lining paper which has been forwarded by a clever device from the rear part of machine. Grippers then carry it through rollers after end and side slides have turned in the cloth over the board, and a rubber belt delivers it on stand completely finished.

Stamping.—The ornamentation of both cloth and leather covers for most bindings other than single books or single sets is rapidly and neatly accomplished by a process called stamping. Stamping was introduced to overcome the difficulty in hand tooling the cotton cloth and principally for reason of the need of a much cheaper and quicker method for lettering and ornamenting the increased quantities of books sold when the muslin or cloth was introduced as a binding for books.

The process of casing, as it is called, consists in pasting the outer end leaves of a book, placing in proper position on cover, and cover then is drawn over and book shifted to secure evenness of squares or margins, then built up on press boards with brass rims which press into the joints, and after several hours' pressure, sufficient time being given to thoroughly dry, the books are removed from press, opened up and examined, wrapped and boxed for delivery.

EDWIN S. IVES,

Of Edwin Ives & Sons, New York.

Bookkeeping is the recording of the transactions of a business so that the resources and liabilities may be readily exhibited. Transactions are recorded in the order of their occurrence in such books of original entry as may be imposed by the nature of each business or which conform to the requirements of the accounting system in use. If but a single book is used for this purpose, its form is usually that of the

day-book, which contains a narrative of all the transactions as they occur. Formerly this was the general procedure, but it is found that business can be expedited by classifying the transactions in separate books, consequently the cash-book, purchase-book, and sales-book are now commonly used concurrently. Whatever may be the character and extent of the original records, the transactions are ultimately transferred in classified form to the ledger, which is the principal book of accounts. There are two systems of bookkeeping in use, namely, single and double entry. The primary element in each of the two systems is the Account. In bookkeeping by single entry only accounts with persons are kept in the ledger, and the profits and losses are ascertained solely by comparison of past with present conditions; in other words, by taking the difference between the net worth at the beginning and the net worth at the close of a stated period. The principal books used in single entry are the day-book, cash-book, and ledger. Being a simple though necessarily imperfect method, single entry is used chiefly by retail traders. Bookkeeping by double entry, as the term implies, is that mode in which every transaction is entered twice, first on the debtor side of one or more accounts, and next on the creditor side, thereby keeping the ledger perpetually in balance. The chief objects of keeping accounts, it may be stated, are to determine (1) the amount of profit or loss during a definite period, and (2) the amount of net capital or net insolvency at the end of such period. The system of double entry gives the net capital or net insolvency in two different ways, from two different sources, the one corroborating the other, and constituting what is called the balance of the books. Upon the classification resulting from this arrangement rests the claim of double entry bookkeeping to be considered as a science.

Bookkeeping, like most other sciences, has adopted a terminology of its own to avoid circumlocution. For example, the terms debtor and creditor, usually abbreviated Dr. and Cr., are used arbitrarily to designate the right-hand and left-hand side, respectively, of an account. An account is a collection of items, under an appropriate title, so arranged as to give a result by comparison.

Journalizing is the mental process of deciding how every transaction is to be disposed of in the ledger; that is, what accounts are to be debited and credited in each case. Posting is the transferring of debit and credit items to their proper accounts in the ledger. A trial balance is a list of the open accounts in a ledger together with the debit and credit footing of each account. A business statement is a summarized exhibit of those accounts which comprise all items of revenue, otherwise denominated a profit and loss account. A financial statement is a compilation of those accounts having to do with capital, in other words, a balance sheet. A balance sheet is a condensed statement of the resources and liabilities of a business. It is usually compiled from the trial balance and inventory schedules at the end of a fiscal period and it is frequently accompanied with a profit and loss statement which confirms the increase or diminution of finance as displayed in the balance sheet proper. The function of a balance sheet is,

therefore, to present a scientific statement of the financial condition of a business at a specified date.

The problem presented in bookkeeping, as may be inferred from the foregoing, is that of exhibiting financial transactions as they occur in the most minute detail, and ultimately in the most condensed form. The best solution of this problem in any given instance, depends largely upon the nature of the individual business the operations of which are to be recorded.

The advantages of the double entry system over the single entry system may be summarized briefly as follows: (1) The susceptibility of infinite modification in its minor features without disturbing the general results as shown in the balance sheet; (2) the constant equilibrium of debits and credits, the mathematical proof of which is afforded in the trial balance; (3) the separate classification of capital and revenue accounts, the resultant statement of each class being confirmatory of the accuracy of the other; (4) the displaying of the channels through which profit and loss items have accrued, thus revealing the methods by which the movements of the business have been financed; (5) the provision for the ascertainment of gross profit on the different departments of a business by means of the trading accounts; (6) the working economy resulting from the introduction of special columns in the books of original entry; and (7) the ease with which a thorough audit can be conducted at any time, this circumstance serving as a check upon erroneous entries.

A double-entry ledger, as before stated, is the book of accounts. As such it is a concrete expression of the principle of classification, and the philosophic basis of the "science of accounts" is displayed therein with mathematical precision. Each separate account contained in the ledger is built up on the theory of comparison. Thus, the items of one side denote increase or plus of financial ability, those of the other side denote its decrease or minus. Hence, to know the proper place in the ledger in which to assign each item in a transaction, is to know the laws, principles, and objects of each account in the ledger; and a false entry can only be proved false by showing its want of conformity to some principle of the ledger. Take the cash account for illustration: The left-hand or debit side contains the items of cash received; and the right-hand or credit side the items of cash disbursed; the difference between the receipts and payments will, necessarily, be the balance or amount of cash on hand, which, in this case, can be confirmed by actual count. Again, the merchandise account shows on the debit side the value of the goods on hand at the beginning and the cost of all subsequent purchases; the credit side shows all returns or sales of such goods, to which is added the value of the goods on hand at the end; the difference or balance, being the excess of production over cost, or of cost over production, as the case may be—in other words, the gain or loss. Each separate account, therefore, is constructed in accordance with a fixed and unalterable plan and each contributes a definite result which must be considered in the final showing. Being based upon the theory of the equation, there follows a double record of each item in every account with the result that the total debits always equal the total credits when the several accounts are taken

together. It should be noted in this connection that finance, only, is the essential object of accounts, namely, cash, notes, book debts, or their equivalents; any other property is only introduced into the books to show how far it contributed to the increase, or occasioned the diminution of finance, and so to corroborate the actual amount of financial ability found to exist. The great and almost the only source of confusion in double entry is that of confounding an account kept to show financial ability with an account to ascertain how much the profit on some property dealt in has contributed to whatever augmentation may be found in the state of the finances after a certain period of business.

It will be apparent that two distinct ideas are concurrently promulgated through all movements of the business directed toward an increase of wealth. These two ideas are concentrated in the cash and merchandise accounts, respectively, as types of the two classes of accounts. These two classes of accounts have been denominated, business and financial: the former revealing the movements of the business, the latter its financial results. In other words, business accounts show the losses and gains, and financial accounts show the resources and liabilities. Thus it will appear that the debits of the financial accounts show an increase of wealth and the credits decrease, and that the business accounts simply show the same thing reversed. Accordingly, the sum of all the resources of a concern less the sum of all its liabilities is its net capital. All increase or diminution of net capital comes from the receiving of more or less for property than its cost or the appreciation or depreciation of property while in possession, or from rent, interest, taxes, and service. The net gain or net loss of a concern, therefore, during any specified period must be exactly equal to the increase or decrease of net capital during the same period. In a manufacturing concern, for example, it is important that the progress of the business be shown at frequent intervals. It should be possible at any time to ascertain the cost of production of each article manufactured and to verify this cost by a statistical comparison with previous costs. This implies (1) that such a system of stock-keeping be inaugurated as shall show the amount of material consumed in the process of manufacture; (2) that the expenditures for labor be shown for each of the successive steps essential to bringing the article to a completed condition; (3) that costs of superintendence and incidental shop charges be pro-rated; (4) that the general expenses be distributed among the goods manufactured; (5) that adequate provision be made for depreciation; (6) that specific reserves be set aside for bad debts, taxes, contingencies, etc., and (7) that final profit shall be based on the total inclusive cost of production. The application of scientific principles to the accounting system should enable the management to have placed periodically before it, such facts relating to the cost of production as are essential to the shaping of a successful policy in these times of intense industrial competition.

The manner of recording transactions before they are arranged in the ledger, varies in almost every business, but this variation presents no confusion whatever when the different accounts embodied in the ledger are thoroughly under-

BOOKKEEPING

stood. Double-entry accounting, in fact, admits of a great variety of modifications, erroneously, in many cases, called systems. The so-called voucher system, for instance, now extensively used in railway and manufacturing corporations, is an expedient for eliminating from the ledger individual accounts with creditors. At the same time, by the device of special columns in a voucher register, it facilitates the most minute subdivision of revenue expenditures and renders periodic comparison of such items possible to any degree desired. In most lines of business special columns may also be introduced in the cash-book, sales-book, and journal for the purpose of minimizing the mechanical labor of posting, the aggregate of each column being transferred to the corresponding ledger accounts instead of the separate items. The principle of consolidated postings is applied in dividing the accounts of the general ledger among a series of subordinate ledgers, a com-

Loose leaf and card ledgers, impression sales-books, duplicate order blanks, and the many mechanical devices for the curtailing of labor or the securing of expediency or directness in recording, do not come within the limits of this discussion which is intended rather to give a general view of the subject and its underlying principles.

Auditing.—Broadly stated, it is the province of the accountant to devise the accounting system and to specify the nature and character of the records that shall be kept; it is the duty of the bookkeeper to perform the routine work of recording the transactions of the business in accordance with the plan outlined by the accountant; it is the function of the auditor to examine critically the completed records of the bookkeeper, to compare the entries with the documents, to ascertain if the plans of the accountant have been strictly followed, and, finally, to prepare the profit and loss account and certify

FORM OF DAY BOOK.

New York, July 1, 1903.

Joseph Hardcastle began business this day with the following resources and liabilities:					
Cash on hand,		6000			
Bills receivable, note signed by B. F. Williams,		4000			
Elston E. Gaylord owes him on account,		2500			
Stock of goods on hand at present value,		5000			
Total resources,			40	17500	40
Bills payable, for note favor Charles W. Haskins,		8400			
Leonard H. Conant for amount owed him on account,		2850			
Total liabilities,				11250	
Joseph Hardcastle's net capital,				6250	40
2					
Bought of Henry R. M. Cook on account					
200 bush. potatoes @ \$1.10,				220	
3					
Received cash for B. F. Williams' note now due,				4000	
4					
Sold Edgar M. Barber on account at 30 days,					
60 bbls. apples @ \$3.50,		210			
400 bush. corn @ 80c.,		320		530	
5					
Received from Elston E. Gaylord, cash in full of account,				2500	
6					
Lent O. P. Kinsey, cash, receiving his note at 90 days with interest at five per cent,				1000	

mon division being: general, sales, and purchase ledgers. Each of these ledgers can be made self-balancing, if desired, by means of special columns in the books of original entry, a controlling account being kept in the general ledger, representing the aggregate sums in each of the subordinate ledgers. A separate ledger can thus be appropriated, if the magnitude of the business demands it, to the names beginning with each letter of the alphabet, or any number of letters may be included in one, as A to K, A to G, etc. By this means separate duties may be assigned by the accountant to a large number of subordinates, the general ledger consisting of but few accounts, from which, however, he is enabled to show promptly the condition of the entire business. A private ledger is kept by some proprietors for the purpose of withholding from subordinates certain information. The difference between the total debits and credits of the private ledger accounts should complete and confirm the general trial balance. Capital, profit and loss, investments, and other accounts can be kept in this manner with perfect security.

to the correctness of the balance sheet. It is incumbent upon the auditor to exercise every faculty and means in his power to determine (1) that the liabilities are all stated; (2) that the resources are not overstated; (3) that the profit and loss account contains all expenses chargeable to the period under review; (4) that the profits earned are all included; (5) that proper charges against revenue have not been capitalized; and (6) that intentional errors, irregularities, and fraudulent entries have not been permitted. The professional duties of the competent public accountant and auditor, therefore, cover a wide range of technical knowledge and commercial experience. A large number of text-books on elementary bookkeeping have been published, principally for schoolroom instruction. For a broader treatment of the subject application for special reference books may be made to members of the State Societies of Certified Public Accountants and the American Association of Public Accountants, or the following works may be consulted: Lisle, 'Accounting in Theory and Practice'; Dicksee, 'Auditing'; Broaker, 'American Accountants' Manual';

BOOKKEEPING

Dawson, 'Accountants' Compendium'; 'American Business and Accounting Encyclopædia'; Gottsberger, 'Accountants' Guide for Executors'; Arnold, 'Complete Cost Keeper'; Miller, 'Cost Accounts'; Keister, 'Corporation Accounting and Auditing'; Metcalf, 'Cost of Manufactures'; Lewis, 'Commercial Organization of Factories'; Matheson, 'Depreciation of Factories'; Whinney, 'Executorship Accounts'; Garcke & Fells, 'Factory Accounts'; Norton

and Feasey, 'Newspaper Accounts'; Soule, 'New Science and Practice of Accounts'; Fischer, 'Railway Accounts and Finance'; Norton, 'Textile Manufacturers' Bookkeeping.' It is proper to state that in the preparation of this article the undersigned is also indebted to the writings of Mr. Thomas Jones and to suggestions from Prof. Joseph Hardcastle, two of the ablest writers on accounting that America has produced.

Insurance premiums,					
Rent for July, 1903,					

Book-plate, a printed or engraved label, usually decorative, placed on the inside cover of a book as the owner's symbol. In a certain sense, any individualized label is entitled to the name; but as usually understood, the term is restricted to those with some special artistic design, which, however, may range from the simplest to the most elaborate and ornate composition. The elements are—the owner's name; his coat of arms if he has one, usually, but not invariably; allegorical emblems or compositions; landscape designs; mottoes; quotations, etc. In purpose they are probably very ancient: some of the small tablets found in Assyrian libraries are intelligible only as book-plates, and they are accredited to Japan in the 10th century. Indeed, something of the sort may almost be predicated of any society where books circulate much. But our modern book-plates are of German descent, and seem to have been nearly contemporaneous with printing, one being mentioned as of the mid-15th century; the earliest actually known, however, is a hand-colored heraldic wood-cut of about 1480, in some books and manuscripts presented to the monastery of Buxheim, Swabia. The earlier ones were all mere indices of ownership, rough wood-cuts with no artistic design; they were permanently raised into the domain of an art by the great Albrecht Dürer (1471-1528), the "father of the book-plate." He made two for Bilibald Pirckheimer, probably before 1503—one a mixture of armorial and allegorical elements, and the other a large bold portrait of the famous Nuremberg senator; but his earliest dated one is for Hieronymus Ebner of the same city, in 1516. Several of the great German artists of that age—Holbein, Cranach, Amman, and others—designed book-plates; indeed, since Dürer's time the best have not disdained this branch of art, and wealthy collectors have vied with each other in costly designs.

The idea was soon adopted in other European countries. The French wrought with great delicacy and beauty, but with too elaborate and profuse decoration. The English were very late in adopting the fashion: the number of examples which have come down from before the Restoration is singularly few, and the first engraved one we possess is that of Sir Nicholas Bacon, father of the Chancellor, dated 1574; though an old folio volume from Henry VIII's library, now in the British Museum, contains

an elaborately emblazoned drawing which formed the book-plate of Cardinal Wolsey, with his arms, supporters, and cardinal's hat. But after the Restoration they multiply so rapidly that owing to the great number of wealthy English collectors, they far outnumber all the rest of the world, and some of them have considerable historical interest. Pepys had several, one with initials and crossed anchors probably as early as 1668, one with his portrait not earlier than 1685. Among other English names highly prized by book-plate collectors may be mentioned Bishop Burnet, William Penn, Robert Harley, Matthew Prior, Lawrence Sterne, David Garrick, Horace Walpole, John Wilkes, and Charles James Fox. Among the artists who have engraved them are those of William Marshall and Robert White, Hogarth, Bartolozzi, Bewick, and Vertue. Bewick at one time was regularly employed in their production. One of the prettiest of book-plates is that designed in 1793 by Agnes Berry for the Hon. Mrs. Damer, and engraved by Francis Legat.

The style of design, naturally, has varied with the taste of the age, and is no mean index of its characteristics. The chief English styles have been classified by Lord de Tabley, the leading modern authority, as follows: Early English, entirely armorial, with profuse mantling, and large full-rounded curves surrounding three and often four sides of the shield. Jacobean, from about the time of James II. to 1745, with a heavy carved appearance, an even balance of proportions, always a regular outline, and often a carved molding around it which makes a massive rectangular frame—a dignified and reposeful if rather formal style. The Chippendale succeeded, lighter and more graceful, with rich curves and airy scrolls, the helmet gone, no set form of shield, and a profusion of careless sprays and garlands, etc. This degenerated with poor artists into an incongruous mass of overdone and rococo ornamentation, a heap of all the unrelated objects of nature and art and the most artificial frivolities of design, portraits, and castles, and ruined abbeys, Watteau shepherdesses and shepherds, lambs and dragons, dogs and ships, etc. About 1770 came in the Ribbon and Wreath, with a shield decorated as the name implies, much simpler and more tasteful.

The American settlers for more than a century made no attempt at book-plates of their

own manufacture: the richer colonists looked to England for everything, especially luxuries and articles of culture, and the others had no time or taste for superfluities. Naturally enough, most of these early plates belong in the southern colonies, where there was more of leisure and cultivation of the decorative side of life; but for the same reason, their more intimate connection with England and preference for its ways, as well as superior taste, they continued to use its book-plates almost exclusively long after American engravers were actively employed upon this branch of work. Very few of the old southern plates are of American design, and consequently they are much less valued by collectors (except for the owner's sake, as with Washington's) than the northern; though the latter are much cruder in heraldry, design, and execution. The earliest dated and signed American plate by a native engraver is that of Thomas Dering, engraved in 1740 by Nathaniel Hurd of Boston; the next is of John Burnet (1754), by Henry Dawkins, who settled in 1730-77, the best of our early engravers, though there is no doubt that an earlier one of Hurd's was that of Edward Augustus Holyoke; Philadelphia and later in New York; then comes that of Benjamin Greene (1757), by Hurd; then of the Albany Society Library (1759). Paul Revere also engraved book-plates; as did Amos Doolittle of New Haven, Peter Maverick of New York, Alexander Anderson of New York (the first American wood engraver, sometimes called the "American Bewick"), and others, in the northern States, especially around the great centres like Boston, New Haven, Philadelphia, and Baltimore. They worked mainly in the Chippendale style till it gave place to the Ribbon and Wreath, and originated no new style.

The earliest book-plates were of large size, as if made specially for folios; but a smaller size soon became general, and was used for books of all sizes. Some owners, however, have used different plates for different sizes; some of Sir William Stirling-Maxwell's were of gigantic proportions.

The collection of book-plates is a very modern amusement, but has risen to enormous proportions. The first collector known was Dr. Joseph Jackson Howard, and his collection numbered over 100,000. Sir Augustus Wollaston Franks of London had one of some 200,000, which he left to the British Museum. A German nobleman, Count Karl Emich zu Leiningen-Westerburg, had also an exceedingly fine one. A number of large and valuable ones exist in the United States, including that of the Grolier Club, which gave in 1894 the first American public exhibition of them. There is a cosmopolite association of collectors and connoisseurs, the *Ex Libris* Society of London (1890), issuing a monthly journal, and there are also periodicals devoted to it in France and Germany. There are regular "prices current" of book-plates among dealers, and auction sales as of books. The intelligent study of them is based on the work of the English poet John Byrne Leicester Warren, afterward Lord de Tabley, who published, in 1880, his 'Guide to the Study of Book-Plates,' which has no rival, and whose classifications are universally accepted. Special works on particular divisions, besides works in foreign languages, are, among

others, Castle's 'English Book-Plates' (1892); Hamilton's 'French Book-Plates' (1892); Hardy's 'Book-Plates' (1893); C. D. Allen's 'American Book-Plates' (1894), Labouchere's 'Ladies' Book-Plates' (1895); Hamilton's 'Dated Book-Plates' (1896); etc.

Books, Censorship of. Unless we consider the burning of condemned books under the Roman emperors as a censorship, the establishment of this institution must be attributed to the popes; but it cannot be denied that it would have sprung up in a thousand other places even if it had not existed in their dominions. Soon after the invention of printing, the popes perceived the influence which this art exerted over the diffusion of knowledge. It was besides doubly dangerous at a time when the authority of the Church had been assailed, and was shaking under the load of its abuses. They endeavored therefore to prohibit first the reading, and secondly the printing, of certain literary works. They enforced the ancient decrees of the Church against the reading of heretical books, and introduced an ecclesiastical superintendency of the press in 1479 and 1496, more completely established by a bull of Leo X. in 1515. In this the bishops and inquisitors were required to examine all works before they were printed, and thus to prevent the publication of heretical opinions. They went still farther: as this papal decree could not be carried into execution in all countries on account of the Reformation, they prepared an index of books which nobody was allowed to read under penalty of the censure of the Church. This index was commenced by the Council of Trent, in the fourth session of which (1546) the decree of the censorship was renewed; but it was not executed, and was finally left to the popes (25th session of 1563), by whom several such 'Indices Librorum Prohibitorum' have been published. Works of an established character, which could not well be prohibited, it was determined to expurgate. The Duke of Alva caused such an 'Index Expurgatorius' to be prepared in the Netherlands; another was drawn up at Rome in 1607; but there are serious difficulties in expurgating books. The papal government still continues the policy of prohibiting to the faithful the reading of works deemed dangerous, and the Congregation of the Index has still its place and functions at Rome.

In Germany the politico-theological controversies gave the first occasion for the introduction of this institution, as they were carried on with the greatest violence on both sides. The decree of the German diet in 1524 prohibited them. By the diet of 1530 a more severe superintendence of the press was established; and this was confirmed by later laws of the empire in 1541, 1548, 1567, and 1577, etc. It was also provided at the Peace of Westphalia, 1648 (Osnabr. Instr., cap. v. sec. 50), that the states should not suffer attacks on religious parties. From that time the emperors have promised, in their elective capitulations, to watch strictly over the fulfilment of this article. In the capitulations of the Emperor Leopold II., 1790, and of the Emperor Francis II., it was further added (art. vi. sec. 8), "that no work should be printed which could not be reconciled with the symbolical books of both Catholics and Protestants, and with good morals, or which

might produce the ruin of the existing constitution, or the disturbance of public peace." It was, however, not difficult in most Protestant countries for individual authors or literary journals to obtain an exemption from the censorship; and many institutions, academies, universities, etc., were privileged in this way as far as concerned their regular professors. The governments sometimes protected their subjects with great energy; as, for instance, that of Hanover, in the case of Putter and Schloezer. Censorship was first abolished in England. It was formerly exercised by the well-known Star-chamber, and, after the abolition of this court in 1641, by the Parliament. In 1662 it was regulated by a particular statute, but only for a certain number of years. This statute was renewed in 1679, and again in 1692 for two years more. In 1694 the right of the crown to render the printing of writings, journals, etc., dependent on its permission,—that is, the censorship,—ceased entirely. In Holland, and even in the Austrian Netherlands, a great liberty, if not an entire freedom of the press, prevailed. All that was not permitted to be printed in France appeared in the Netherlands or in Switzerland, at Lausanne and Geneva, to the great advantage of the Dutch and Swiss book-trade.

In Sweden, by an edict of 1766, and accordingly under the aristocratical constitution, the abolition of the censorship was ordered; yet Gustavus III., personally a friend to the liberty of the press, was obliged to retain the censorship, and even to execute it with severity, during the aristocratical machinations which disturbed his reign, and which were but imperfectly counteracted in the Revolution of 1771. Gustavus IV. issued an edict soon after he ascended the throne, by which the censorship was retained only in matters of religion, and was administered by the consistories. This, however, was not permanent; at first penalties were enacted, and in 1802 the censorship was entirely re-established, committed to the chancellor of the court, and executed with severity. French and German books were prohibited. King Charles XIII., immediately after his ascension to the throne, abolished it entirely by a provisional order of 12 April 1809, which was confirmed as an article of the constitution (sec. 86), 6 June 1809. In Denmark, by a royal rescript of 14 Sept. 1770 (under the minister Struensee), the censorship was wholly abolished; neither has it been restored, though the laws by which the liberty of the press has been regulated have been changing, and have sometimes been very oppressive. In France the censorship, which had belonged to the department of the chancellor and been administered by royal censors, was annihilated by the revolution. All the constitutions, from 1791 to the Charte Constitutionnelle in 1814, declare the liberty of the press one of the fundamental laws. During the republic there was no censorship, but the revolutionary tribunals took its place. Napoleon restored it in another form by the decree of 5 Feb. 1810 (*Direction de l'Imprimerie*). Since the Restoration it has also undergone various changes. Books of more than 20 sheets have always remained free, but the censorship has been exercised over pamphlets and journals at different periods. Under the government of the Emperor Napoleon III. the censorship was

re-established with new penalties, and is still maintained.

In the kingdom of the Netherlands the censorship was abolished by a fundamental statute of 24 Aug. 1815 (art. ccxxvi.), and this statute is still in force in the kingdom of Holland. By art. xviii. of the constitution of Belgium, 1831, it is declared that the press is free, and that no censorship can ever be established. In the German states the liberty of the press was much restrained till 1806, the state-attorney having till then had control over it. After 1814 several states abolished the censorship, though with very different provisions as to the responsibility of authors, printers, and booksellers. In accordance with the unhappy decrees of Carlsbad, 1819, and the resolutions of the German diet of 20 Sept. 1819, the censorship in all the states of the German confederation became one of the conditions of union, but only with regard to books of less than 20 sheets, and journals. These laws were repealed in 1849, but in the course of a few years they were gradually introduced, although in a modified form, and in this form they still exist in most of the separate German states as well as in the empire. In Russia and Austria there is naturally a despotic censorship. In the United States of America a censorship has never existed.

Besides the different degrees of severity with which the censorship is exercised in different countries, it may be divided into different kinds, according to the field which it embraces. (1) A general censorship of the book-trade and of the press, under which even foreign books cannot be sold without the consent of the censors, exists in Russia, Austria, Spain, etc. (Austria has, in the censorship of foreign books, four formulas: (a) *admittitur*, entirely free; (b) *transeat*, free, but without public advertisements for sale; (c) *erga schedam*, to be sold only to public officers and literary men on the delivery of a receipt; (d) *damnatur*, entirely forbidden.) (2) A general censorship of the press, extending only to books printed in the country, exists in Prussia (edict of 19 Sept. 1788; order of the cabinet of 28 Dec. 1824; law of 12 May 1851). (3) A limited censorship, only over works of less than 20 sheets, and journals, is at present the law in the states of the German empire. See PRESS, LIBERTY OF THE.

Boolak, boo-läk', **Boulak**, or **Bulak**, an Egyptian town on the Nile, and the port of Cairo. Its site was once an island, but that part of the river which separated it from Cairo has been filled up. In 1799 Boolak was burned by the French. Mehemet Ali rebuilt it, and established extensive cotton-spinning, weaving, and printing works, a school of engineering, and a printing establishment, from which is issued a weekly newspaper in Arabic. The town contains a mosque, a naval arsenal, a dockyard, and a custom-house, and is surrounded by the country residences of numerous Egyptian grandees. An electric railway connects it with Cairo. Pop. about 13,000.

Boole, George, English mathematician and logician; b. Lincoln, 2 Nov. 1815; d. Cork, 8 Dec. 1864. Educated in his native place, he opened a school in his 20th year, and by private study gained such proficiency in mathematics that in 1849 he was appointed to the mathematical chair in Queen's College, Cork, where the

rest of his life was spent. In mathematics he wrote on 'Differential Equations'; 'General Method in Analysis'; 'The Comparison of Transcendents,' etc. In logic he wrote 'An Investigation of the Laws of Thought' (1854), an amplified edition of his earlier 'Mathematical Analysis of Logic' (1847), a profound and original work, in which a symbolic language and notation were employed in regard to logical processes.

Boom, in fortification, and in marine defenses, a strong chain or cable stretched across the mouth of a river or harbor, to prevent the enemy's ships from entering, and having a number of poles, bars, etc., fastened to it; whence the name; as, to cut or burst the boom. It often denotes a long pole employed to extend the sails of a ship, as the main boom, jib boom, etc. The term may also be applied to a pole set up as a sea mark to point out the channel to seamen, when navigating in shallows. The word also designates a hollow, roaring sound; as, the boom of a cannon; the reverberating cry of the bittern. In recent years it is often used to denote a sudden rise in the market value of real estate, stocks, or commodities; an enthusiastic popular movement in favor of any person, cause, or thing; as, a real estate boom, a political boom, a boom in sugar.

Boomerang, a missile or weapon of a peculiar nature used by the natives of Australia. It is from 30 to 40 inches in length, and is made of hard wood. In shape it is curved somewhat like a scimitar or a parabola, or it may have a decided bend in the middle nearly approaching a right angle, the bend being a natural one. The breadth is usually about three inches, and while one surface is flat the other is somewhat rounded. Boomerangs are of different kinds, some being used in war, others in the chase, others for amusement. One variety can be hurled so as to turn while in the air and come back almost to the place whence it was thrown. It is this peculiarity that has made the boomerang so famous, though the returning boomerang, if not used merely for amusement, is only used to bring down birds. In throwing, the weapon is grasped by one end, and after a short run hurled straight in front. It then takes a horizontal position and revolves rapidly as it moves obliquely upward into the air. After a time it curves round, and if he so intends, comes back close to the thrower. It may move for a considerable distance horizontally at only a few feet above the ground, and then suddenly rise vertically upward with great velocity. The peculiarly irregular character of its path through the air, and the rapid change in its direction of movement, render it a very efficient weapon for killing birds. There is also a special boomerang for killing birds capable of being thrown in a straight course of 200 yards. The Australian natives often throw the boomerang in such a way as to cause it to strike the ground about 30 feet off; this is said to impart increased velocity, and the weapon may even hit the ground a second time and rebound into the air. The war boomerang is larger and heavier than that used in hunting. Weapons similar to the boomerang, or kiley, as the Australians also call it, but lacking the property of returning, have been, and still are, used by other races, notably the ancient Egyptians and the modern

Abyssinians. Sir Samuel Baker describes the latter as about two feet long, and made of a piece of flat hard wood, whose end turns at an angle of 30°. Various derivations of the word have been suggested, one connecting it with a root meaning strike or kill, and another with the native word for wind.

Boondoe, boon-dē', or **Bundi**, a native state of Hindustan, in Rajputana, under British protection; area 2,300 square miles. A range of hills running from southwest to northeast, penetrated by few passes and rising to the height of 1,793 feet, divides the state into two almost equal portions, that on the south being the more fertile. Much of the state is underwood. The chief river is the Mej, which penetrates the central range, and joins the Chambal near the northeast extremity of the state. It was much more extensive before Kotah and its territory were separated from it. The inhabitants are of the Hara tribe, which has given birth to many famous men, and, among others, to Ram Singh Hara, one of Aurungzebe's most renowned generals. The ruler is practically absolute in his own territory. Pop. (1901) 171,227. **BONDEE**, the capital, is picturesquely situated on a steep slope in a gorge in the centre of the hills above mentioned, and its antiquity, numerous temples, and magnificent fountains, give it a very interesting appearance. It is crowned by a fort and surrounded by fortified walls. For picturesque effect its main street is almost unequalled. At its upper extremity stands the palace, built of stone, with turreted windows and battlements, supported partly by the perpendicular rock, and partly by solid piers of masonry 400 feet high. At its lower extremity is the great temple dedicated to Krishna. Pop. 31,000.

Boone, Daniel, American pioneer: b. Bucks County, Pa., 11 Feb. 1735; d. 26 Sept. 1822. He was one of 11 children. His father emigrated from England, and when Daniel was very young removed with his family from Bucks into Berks County, not far from Reading, then a frontier settlement, exposed to Indian assaults. It abounded with game, and thus, Daniel became accustomed to a life in the woods, and formed an intense love for uncultivated nature. His education was confined to a knowledge of reading, writing, and arithmetic. When he was about 18 his father removed to North Carolina and settled on the Yadkin. Here, in 1755, Daniel married Rebecca Bryan, and for some years followed the occupation of a farmer, but about 1761 his passion for hunting led him, with a company of explorers, along the wilderness at the head waters of the Tennessee River. In 1764 he joined another company of hunters on the Rock Castle, a branch of the Cumberland River. He had become dissatisfied with life in North Carolina. The customs of the colony were becoming luxurious; the rich were exempt from the necessity of labor, and the people were much oppressed by taxes. Boone imbibed a chronic hatred of law forms which lasted through life, and his neglect of these, in securing his titles to land, reduced him to poverty on more than one occasion.

In 1767 a backwoodsman named John Finley made an excursion farther west than had before been attempted, and returned with glowing accounts of the border region of Kentucky, which he represented as a hunter's paradise. Boone

headed a party of six for its exploration, leaving his Yadkin home 1 May 1769. On 7 June, in the same year, they reached an elevation from which they beheld the whole region watered by the Kentucky River and its tributaries. At this point on the waters of the Red River, a branch of the Kentucky, and supposed to be within the present limits of Morgan County, they halted and hunted until December without seeing a single Indian, although they were continually on the alert for them. They then separated into parties, Boone and a man named Stewart keeping company, and on 22 December these two were surprised and captured by Indians, who robbed them and kept them prisoners for seven days, when they managed to make good their escape. Early next month Boone and Stewart were gratified by the arrival in the wilderness of Daniel's younger brother Squire and another hunter from North Carolina, bringing tidings of the family at home and a much-needed supply of powder and lead. Soon after this event Stewart and Boone were again attacked by Indians. Boone escaped, but his companion was shot and scalped, and the man who came with Squire having perished in the woods the two brothers were left alone together. On 1 May it was decided that Squire should return for supplies, while Daniel remained to take care of and increase the store of peltry. They parted, and until 27 July, when Squire returned, Daniel remained in utter solitude, without bread, salt, or sugar. The brothers then continued their explorations over other parts of Kentucky until March 1771, when, taking as much peltry as their horses could carry, they returned to their families on the Yadkin, Daniel having been absent about two years, during which time he had seen no human beings but his hunting companions and the hostile Indians. He was now anxious to remove to Kentucky, and although his wife and children were easily persuaded to do so, two years elapsed before he could make the necessary arrangements. He sold his farm, and on 25 Sept. 1773, the two brothers, with their families, set out for Kentucky. At Powell's Valley, through which their route lay, they were joined by five families and 40 men well armed, but on approaching Cumberland Gap, near the junction of Virginia, Kentucky, and Tennessee, they were attacked by Indians and were forced to retreat 40 miles to Clinch River, leaving six of their party slain, among whom was Boone's eldest son, James. The emigrants were much disheartened, and Boone remained at Clinch River until June 1774, when Gov. Dunmore sent him a message to proceed to the wilderness of Kentucky and conduct thence a party of surveyors who were believed to be in danger from the Indians. This undertaking was successful, but no incidents of it have been preserved excepting that Boone was absent 62 days, in which he traveled on foot 800 miles. While he was gone to Kentucky the Shawnees and other Indians northwest of the Ohio River became hostile. Boone was appointed to the command of three contiguous garrisons, with the commission of captain, and, having fought several battles and defeated the Indians, he returned to his family on Clinch River and spent the next winter in hunting. He was shortly after employed by the Transylvania Company, established to purchase lands in Kentucky, to explore, mark, and open a road

from settlements on the Holston to the Kentucky River. In the face of great dangers this was accomplished, and on 1 April 1775, a site having been selected on the bank of the Kentucky River, the party erected a stockade fort and called it Boonesborough. Boone soon removed his family to the new settlements, his wife and daughters being the first white women that ever stood on the banks of the Kentucky. The winter and spring of 1776 wore away without any particular incident, as the Indians, though by no means friendly, made no direct attack. On 14 July a daughter of Boone and two female companions were captured by a party of Indians, but next morning Boone and his companions followed the trail and surprised the Indians so suddenly that they had not time to murder their captives, and the three girls were restored to their families. During the whole of 1777 Boone was employed with his command in repelling the attacks of the Indians, who were incited to the most savage deeds of cruelty by the British during the Revolutionary War. His services were of incalculable advantage to the new settlements. On 1 Jan. 1778, the people suffering greatly for want of salt, he headed a party for the lower Blue Licks to manufacture it, and on 7 February, while at some distance from the camp, he was surprised and made prisoner by a party of 100 Indians. Again in this instance his consummate knowledge of the red man's character saved him and his friends. He ingratiated himself in their regard, and obtained favorable terms for his party at the Licks, who became prisoners of war under the promise of good treatment. He knew that the Indians would march to attack Boonesborough, and that if he and his party resisted they would all be murdered and those at the fort massacred, as no warning could reach them. He was conducted to old Chillicothe, and thence to Detroit, where he was kindly received by the English commander, Gov. Hamilton. In order to baffle his captors he pretended to be very much pleased with his mode of life among the Indians, went through the form of adoption by them, having his hair pulled out excepting the scalp-lock, "his white blood washed out" in the river, and his face painted. On 16 June he went out to hunt, and when out of view, started direct for Boonesborough, more than 160 miles distant, which he traveled in less than five days. He reached Boonesborough in time to warn the garrison. All supposed him dead, and his wife, under that impression, had returned with her children to North Carolina. The fort was at once put in complete order for defense, and on 8 August it was besieged by 444 Indians, led by Capt. Duquesne and 11 other Canadians, having French and British colors. Summoned to surrender, Boone replied with defiance, and after a savage attack upon the fort the assailants, six times greater in number than the garrison, raised the siege, leaving 37 of their party killed and many more wounded. Boone was now promoted to the rank of major. In 1778 he went to North Carolina to see his family. The next year, having invested nearly all his little property in paper money to buy land warrants, and having, besides his own, large sums of money to invest for other people, he was robbed of the whole, about \$20,000, on his way from Kentucky to Richmond, where the court of commissioners was held to decide on

Kentucky land claims. In 1780 he returned with his family to Boonesborough, and in October of that year his brother, on a hunting excursion with him, was killed and scalped by the Indians, and Boone himself narrowly escaped. The Indians being exceedingly troublesome, a large party of militia was formed to follow and punish them, who, against Boone's counsel, suffered themselves to be drawn into an ambushade, and the disastrous battle of the Blue Licks followed, in which Boone lost another son and had a brother wounded. At the close of the Revolutionary War Col. Boone returned to the quiet life of his farm and to his passion for hunting. In 1792 Kentucky was admitted into the Union as a sovereign State, and as courts of justice were established, litigation in regard to land titles commenced, and was finally carried to great lengths. From defective titles, Boone, with hundreds of others, lost the lands he possessed, with their valuable improvements, and thus after the vigor of his life was spent, he found himself without a single acre of the vast domain he had explored and fought to defend from savage invaders. Disgusted with his treatment he resolved to abandon Kentucky and move to the far West, which he did in 1795. He settled first on the Femme Osage, about 45 miles west of St. Louis, where he remained until 1804; he then removed to the home of his youngest son until 1810, and finally went to live with his son-in-law, Flanders Callaway. As the country, at the time of his removal, was under the dominion of Spain, on 11 July 1800, he was appointed commandant of the Femme Osage district; and as his fame had preceded him, 10,000 arpents, or about 8,500 acres, of choice land were marked out on the north side of the Missouri River, and given to him for his official services. This princely estate he also subsequently lost, because he would not take the trouble to go to New Orleans to complete his title before the immediate representative of the Spanish crown. Having left Kentucky in debt, he was much troubled for a while by ill success in hunting, but at length he obtained a valuable store of peltry, turned it into cash, went to Kentucky, without book account, paid every one whatever was demanded, and on his return to upper Louisiana with but half a dollar left, said that he was ready to die content. In 1812 he petitioned Congress to confirm the title to his claim of 1,000 arpents of land, which he had neglected to have done in proper form, and was in danger of losing, as he had everything else. He sought the aid of the legislature of Kentucky, and his petition was successfully urged in Congress, in requital for his eminent services. He continued to hunt occasionally as long as his strength remained, but was obliged to give up his rifle several years before his death. Chester Harding, who in 1820 painted the only portrait of him ever taken, informs us that his first sight of the old pioneer found him lying in his bunk in the cabin, engaged in cooking a venison steak on a ramrod. His memory of immediate events was very defective, but of past years as keen as ever. He was quite feeble, but able to walk out with Harding every day. This portrait now hangs in the State House at Frankfort, Ky. He died surrounded by his children and descendants, some of the fifth generation, in the 88th year of his age. On 20 Aug. 1845 the re-

mains were deposited with appropriate ceremonies in the cemetery at Frankfort. In all the relations of private life Boone was a model for imitation. In spite of his many Indian encounters he was a lover of peace, modest in disposition, of incorruptible integrity, moral, and temperate.

Boone, William Jones, American bishop: b. Walterborough, S. C., 1 July 1811; d. Shanghai, China, 17 July, 1864. He graduated from South Carolina College in 1829, was admitted to the bar, but, deciding to devote himself to a missionary life, he prepared for orders at the Virginia Theological Seminary, and was ordained priest in 1837. In order to equip himself thoroughly for his work, he took a course of medical study and received the degree of M.D. from the South Carolina Medical College. He sailed for China in July 1837; in 1844 he was chosen the first American Protestant Episcopal missionary bishop to China, and was consecrated at Philadelphia 25 Oct. 1844. The remainder of his life, save for an occasional visit to the United States for rest or health, was spent in the work of his diocese. He came to be well known for his knowledge of the Chinese language. He began his translation of the Prayer Book into that tongue in 1846, and later was one of a committee appointed to secure an accurate translation of the Bible into Chinese.

Boone, Iowa, a city and county-seat of Boone County, on the Chicago & N. W. and the Chicago, M. & St. Paul R.R.'s, 36 miles northeast of Des Moines. It is an important milling, manufacturing, and coal-mining centre, and in the vicinity are large deposits of fire and pottery clays. The chief industries are the manufacture of flour, brick, tiles, and pottery, and the mining and shipping of coal. The city has five banks, a Federal building, public library, and hospital. It was settled in 1848 and incorporated in 1866. Pop. (1900) 8,880.

Boonton, N. J., a town of Morris County, situated 30 miles from New York, on the Delaware, L. & W. R.R., the Morris and Essex Canal, and the Rockaway River. It has very extensive ironworks, to the early establishment of which (1700) the town owes its foundation. There are also manufactures of agricultural implements, paints, paper, rubber, etc. Pop. (1901) 3,901.

Boonville, or Booneville, Mo., a city and river port, capital of Cooper County, on the right bank of the Missouri River, here crossed by a fine railway bridge, 43 miles northwest of Jefferson City. It is built on a healthful site about 100 feet above the river. Its manufactures are of but little importance, but some trade is carried on. On 16 June 1861, a Confederate force under Marmaduke was put to flight here by Federal troops under Lyon. Pop. (1900) 4,377.

Boorde, or Borde, bôrd, Andrew, English traveler and physician: b. near Cuckfield, Sussex, about 1490; d. 1549. He entered the Carthusian order at the Charterhouse, London, and in 1521 was appointed suffragan bishop of Winchester. The rigor of the Carthusian discipline was too much for him, and about 1528 he obtained a dispensation relieving him from his

BOORHANPOOR — BOOTH

vow. He then studied medicine on the Continent, returning to England in 1530, but soon afterward again visited the Continent, where he studied at the chief medical schools, including those of Orléans, Poitiers, Toulouse, Montpellier, and Wittenberg. His journey extended to Rome and Compostella, and in 1534 he was again in England. His next journey was undertaken at the instance of Thomas Cromwell, in order to ascertain continental opinion about Henry VIII. In 1536 he was in Scotland, studying and practising "in a litle vnyuersyte or study named Glasco," and he speaks of Scotchmen as deceitful, and inveterate haters of the English. During the years 1538-42 he was again on the Continent, and this time he went as far as Jerusalem. While staying in Winchester his open immorality got him into trouble, and he was afterward lodged in the Fleet Prison, London. Boorde, who jocularly calls himself Andreas Perforatus, was the author of several works, among which are the following: 'Fyrst Boke of the Introduction of Knowledge' (about 1547); a 'Handbook of Europe,' the first of its kind; a 'Dyetary' (1542); a medical treatise entitled 'Breuiary of Health' (1547); 'Boke of Berdes,' a condemnation of the beard, known only through an extant portion of a reply by another writer; a book on 'Astronomy'; an 'Itinerary of England'; an 'Itinerary of Europe'; 'Boke of Sermons'; etc. His 'Fyrst Boke' contains the first printed specimen of the Gypsy language. Many other works, such as 'The Merry Tales of the Mad Men of Gotham,' have been ascribed to Dr. Boorde. Dr. Furnivall edited his 'Introduction' and his 'Dyetary' for the Early English Text Society in 1870.

Boorhanpoor, boo-rūn-poor', India, a town of the Deccan, in the division of Nerbudda and the district of Nimar, formerly capital of the province of Candeish, on the north side of the Taptee. When viewed from the opposite side of the river it presents rather an imposing appearance. Many of the streets are wide, regular, and paved with stone; as are also the Raj Bazaar and the market-place, an extensive square, the two handsomest places in the town. The most remarkable public edifices are the Lal Kilah, or Red Fort, a palace built by Akbar, and though much dilapidated, exhibiting still many remains of imperial magnificence; and the Jumma Musjeed, or great mosque, built by Aurungzebe. A singular sect of Mohammedans, named Bohrah, have their headquarters here. They are the chief merchants in this part of India, have Arab features, wear the Arab costume, and derive their origin from a disciple of their great prophet. Boorhanpoor was formerly famous for its muslin and flowered silk manufactures, which are still carried on to a considerable extent. Pop. (1891) 32,252.

Booro, boo-rō, one of the Molucca Islands, in the Indian Archipelago, west of Amboyna, belonging to the Dutch. It is oval in shape, 92 miles long, and 70 broad. It has several bays, of which Cajeli is the largest, and contains a safe harbor sheltered from the monsoons. Viewed from this bay the island has a very fine appearance. In the foreground the minarets and native houses are seen through the openings of the rich tropical vegetation; while lofty mountains, wooded to their summits, shut in the

view. The island is watered by 125 streams, large and small. On the northwest side there are vast swamps swarming with crocodiles. The island contains some high mountains—Mount Tumahu having an altitude of 8,530 feet. Booro produces a variety of valuable woods, balsams, resins, and odoriferous flowers. The chief article of export is cajeput oil, of which about \$50,000 worth is exported yearly; most being sent to Java. The tree from which it is obtained (*Melaleuca cajeputi*) grows also upon the islands of Amboyna, Ceram, Celebes, and Sumatra; but the best oil is procured in Booro. The population (about 60,000) consists of Alfoories in the interior, and Malays on the coast.

Booroojird, **Burujird**, or **Boorojerd**, booroo-jêrd, Persia, a town in the province of Luristan, capital of a district of same name, 190 miles northwest from Ispahan, with a castle and several mosques. It lies in a fertile and well-cultivated valley, yielding saffron, belonging to the Lack tribe. Pop. 20,000.

Boot, an article of dress, generally of leather, covering the foot and extending to a greater or less distance up the leg. The sandal formed the chief foot-covering among the Greeks and Romans, and it is still in common use among Eastern nations. The boot, properly so called, came into use as part of the warrior's equipment about the 14th or 15th century, and since then it has assumed many different forms. The jackboot, a kind of top-boot not yet altogether discarded, was in common use during the latter half of the 17th century, but was to a great extent displaced by the Hessian, which in its turn has given way to more recent forms. The name was given to an instrument of torture made of iron, or of iron and wood, fastened on to the leg, between which and the boot wedges were introduced and driven in by repeated blows of a mallet, with such violence as to crush both muscles and bones. The special object of this form of torture was to extort a confession of guilt from an accused person.

Bootan. See BHUTAN.

Boötes, bō-ō'tēz ("ox-driver," from Gr. *bous*, an ox), a northern constellation; called also by the Greeks, Arctophylax. Arcturus was placed by the ancients on his breast; by the moderns, on the skirt of his coat. Fable relates that Philomelus, son of Ceres and Jason, having been robbed by his brother, Plutus, invented the plough, yoked two bulls to it, and thus supported himself by cultivating the ground. Ceres, to reward his ingenuity, transferred him, with his cattle, under the name of *Boötes*, to the heavens.

Booth, **Agnes** (Mrs. JOHN B. SHOEFFEL), American actress: b. Sydney, Australia, 1846. She made her first American appearance in New York in 1865, becoming later Edwin Forrest's leading lady. She has assumed numerous famous roles with success. She has been three times married.

Booth, **Ballington**, general of the Volunteers of America: b. Brighthouse, England, 28 July 1859. He is a son of William Booth (q.v.), founder of the Salvation Army, with which body he was officially connected until 1896, when he seceded and founded the Volun-

BOOTH

teers, a religious body under the form of a military organization, organized in the interest of the unchurched masses.

Booth, Barton, English actor: b. 1681; d. May 1733. He was educated under Dr. Busby, at Westminster School. An early attachment for the drama was fostered by the applause he met with while performing a part in one of Terence's plays at the annual exhibition in that seminary. He ran away from school at the age of 17, and joined Ashbury's company of strolling players, with whom he went to Dublin. After performing three years in the Irish capital with great applause, he returned in 1701 to London, and, engaging with Betterton, met with similar success. On the death of that manager he joined the Drury Lane Company, and on the production of 'Cato' in 1712, raised his reputation as a tragedian to the highest pitch by his performance of the principal character. It was on this occasion that Lord Bolingbroke presented him from the stage box with 50 guineas—an example which was immediately followed by that nobleman's political opponents. Declamation, rather than passion, appears to have been his forte, though Cibber speaks of his Othello as his finest character. He became a patentee and manager of the theatre in 1713, in conjunction with Wilks, Cibber, and Doggett. He was buried in Westminster Abbey, where there is a monument to his memory. He was the author of *Dido and Æneas*, a mask, various songs, etc., and the translator of several odes of Horace.

Booth, Edwin Thomas, American actor (fourth son of Junius Brutus Booth, q.v.): b. near Belair, Md., 13 Nov. 1833; d. 7 June 1893. When 16 years of age he made his first appearance on the stage, in the part of Tressel, his father acting as Richard III. Two years later he himself successfully assumed the part of Richard in place of his father, who unexpectedly refused to fulfill an evening's engagement. The following year the two went to California, where the son remained for several years, visiting Australia meanwhile. Meeting with little pecuniary success, in 1856 he returned to the Atlantic States, and from that time forward was recognized as a leading member of his profession. He visited England (1861-2), and in 1864 produced 'Hamlet' at New York for 100 nights consecutively. In 1869 he opened a splendid theatre in New York, whose building cost over \$1,000,000, but which involved him in pecuniary ruin. He revisited California in 1876, and in the spring of 1877 was able to settle with his creditors, having earned during the season over \$600,000. Booth visited Great Britain and Germany in 1880-2, and was everywhere received with enthusiasm. He was founder and first president of the Players' Club, New York.

Booth, James Curtis, American chemist: b. Philadelphia, 28 July 1810; d. West Haverford, Pa., 21 March 1888. He graduated at the University of Pennsylvania in 1829, and in December 1832 went to Germany and entered the private laboratory of Prof. Friedrich Wöhler in Cassel, being, it is thought, the first American student of analytical chemistry to study in Germany. Later he studied in Berlin and made a practical study of applied chemistry in European manufacturing centres. Returning to Philadelphia in 1836 he opened a

laboratory for instruction in chemical analysis and applied chemistry. This soon became widely known and attracted students from all parts of the country. In 1836 he was made professor of chemistry applied to the arts in the Franklin Institute; during 1837-8 he had charge of the geological survey of Delaware, and assisted in that of Pennsylvania; in 1849 he was appointed melter and refiner at the United States mint in Philadelphia, an office he held until his resignation, 7 Jan. 1888. His studies of the nickel ores of Pennsylvania led, in 1856, to the adoption of nickel as one of the components of the alloys used in the coinage of the 1857 cent. Publications: 'Annual Report of the Delaware Geological Survey' (1839); 'Memoirs of the Geological Survey of Delaware' (1841); 'Encyclopædia of Chemistry, Practical and Applied' (1850); 'Recent Improvements in the Chemical Arts' (Wash. 1851); and he edited, with notes, a translation of Regnault's 'Elements of Chemistry' (2 vols. Phila. 1853).

Booth, John Wilkes, American actor (son of Junius Brutus Booth, q.v.): b. Hartford County, Md., 1839; d. 1865. He sided with the Confederates in the Civil War, and to avenge the defeat of their cause he formed a conspiracy against the life of President Lincoln. He mortally wounded the President while the latter was attending a performance in Ford's Theatre, Washington, 14 April 1865; in escaping from the building he broke his leg, and concealed himself in Virginia till the 26th, when, on being discovered, and refusing to surrender, he was shot.

Booth, Junius Brutus, English tragedian: b. London, 1 May 1796; d. Dec. 1852. After fulfilling engagements at Deptford, near London, and other places, and even performing at Brussels, in 1814 he made his debut at Covent Garden Theatre, London, as Richard III. His personal resemblance to the crookbacked tyrant conformed exactly to the traditions of the stage, and his personification of the character was in other respects so striking that he competed successfully with Edmund Kean, then just rising into fame. In 1821 he made his first appearance in the United States, at Petersburg, Va., and in New York, at the Park Theatre, in the succeeding year, on both of which occasions he assumed his favorite character of Richard III. From that time until the close of his life he acted repeatedly in every theatre in the United States, and in spite of certain irregular habits, which sometimes interfered with the performance of his engagements, enjoyed a popularity which a less gifted actor would have forfeited. During the latter part of his life he resided with his family at Baltimore, making occasional professional excursions to other cities. He had just returned from a lucrative tour to California when he died. The range of characters which Booth assumed was limited, and was confined almost exclusively to those which he had studied in the beginning of his career. He is most closely identified with that of Richard, in which, after the death of Edmund Kean, he had no rival. Among his other most familiar personations were Iago, Shylock, Hamlet, Sir Giles Overreach, and Sir Edmund Mortimer. In his peculiar sphere,—the sudden and nervous expression of concentrated passion,—as also in the more quiet and subtle passages of his

delineations, he exercised a wonderful sway over his audience, and his appearance upon the stage has been known to awe a crowded and tumultuous house into instant silence. His presence and action, notwithstanding his short stature, were imposing, and his face, originally molded after the antique type, was capable of wonderful expression under the influence of excitement. Several of his children inherited a portion of his dramatic talent, and became prominent actors on the American stage.

Booth, Mary Louise, American journalist and author: b. Yaphank, Long Island, N. Y., 19 April 1831; d. New York, 5 March 1889. She was widely known as the editor of 'Harper's Bazaar,' which place she held from 1867 till her death. Her 'History of the City of New York' was the first complete work upon the subject and is still probably the best. It was published in 1859, a second edition in 1867; a third, thoroughly revised, in 1880. No book has been a greater favorite of local collectors. One copy was extended to nine large volumes and enlarged by many thousand illustrations; another, owned by the author, had 2,000 illustrations inserted; and a third was extended to 22 volumes. Miss Booth's translations number over 30 volumes. They are chiefly from the French of About, Victor Cousin, Mery, Gasparin, and Laboulaye. The most pretentious is Henri Martin's 'History of France,' six volumes of which she finished.

Booth, Maud Ballington, a leader of the Volunteers of America: b. near London, 1865. She was active in the work of the Salvation Army in England, and established a corps of the Salvation Army in Switzerland. In 1887 she married Ballington Booth, and in 1896 joined him in seceding from the Salvation Army and organizing the Volunteers of America. She has been active in work for prisoners, both during their imprisonment and after their release. She is author of 'Branded' and 'Look Up and Hope.'

Booth, William, founder of the Salvation Army: b. Nottingham, England, 10 April 1829. He was educated in his native town, and from 1850 to 1861 acted as minister of the Methodist New Connection. From the first he was zealous in holding evangelistic services, but the new departure which led to the creation of the Salvation Army on military lines began in 1865 with mission work among the lower classes in the East End of London. Since 1878 Booth's movement has been known as the Salvation Army, of which he has continued to be the mainspring and controlling power, directing its movements at home and abroad from his headquarters in London. His enthusiasm and wonderful organizing power have given life to the religious military system, of which he is "general." The property of the Salvation Army is held for its exclusive use by Booth. His wife was associated with him in the publication of several hymns and religious works dealing with the movement, till her death in 1890.

Booth-Tucker, Emma Moss, a leader in the Salvation Army: b. Gateshead, Eng., 8 Jan. 1860; d. 1903. She was a daughter of William Booth, the organizer of the "Army"; in 1880-8, she had charge of international training homes; in 1888 she married Commander Booth-Tucker, went with him to India, and in 1896 came to the

United States. She held the rank of consul in the Salvation Army, and had joint authority with her husband in the United States.

Booth-Tucker, Frederick St. George de Latour, American evangelist: b. India, 1853. He held important official posts in India, but resigned them in 1881 to join the Salvation Army. Upon his marriage with Emma Moss Booth, daughter of "Gen." William Booth of the Salvation Army, he prefixed Booth to his own name of Tucker. From 1896-1904 he was commander of the Salvation Army in the United States, but resigned to become secretary of all the branches of the Army outside of Great Britain.

Boothby, Guy Newell, English novelist: b. Adelaide, South Australia, 13 Oct. 1867; d. London, England, 27 Feb. 1905. In 1891 he crossed Australia from north to south, and also traveled in the East. His novels include: 'On the Wallaby'; 'A Bid for Fortune'; 'Beautiful White Devil'; 'Dr. Nikola'; 'Fascination of the King'; 'Billy Binks, Hero, and Other Stories'; 'Across the World for a Wife'; 'Pharos, the Egyptian'; 'Love Made Manifest'; 'Dr. Nikola's Experiment'; 'A Sailor's Bride'; 'A Maker of Nations'; 'My Indian Queen'; 'Farewell Nicola' (1901); and 'The Viceroy's Protégé.'

Boothia Felix, a peninsula on the north coast of North America, in which is the most northern part of the continent, Murchison Point, lat. 73° 54' N. It is joined to the mainland by Boothia Isthmus, is bounded on the north by Bellot Strait, and to the east is separated from Cockburn Island by Boothia Gulf (q.v.) It was discovered by Sir John Ross (1829-33), and named after Sir Felix Booth, who had furnished \$85,000 for the expedition. Here, near Cape Adelaide, Ross discovered the magnetic pole, lat. 70° 5' 17" N.; lon. 96° 46' 45" W.

Boothia, Gulf of, a southward continuation of Prince Regent Inlet in the northern part of Canada, lying between Boothia Felix (q.v.) on the west and Cockburn Island on the east.

Bootle, England, a municipal and county borough in Lancashire, near the mouth of the Mersey, and adjoining Liverpool, the docks of which great seaport extend into the borough, covering 370 acres and constructed at a cost of £2,500,000. The principal buildings are the town hall and municipal buildings, school-board offices, and hospital. Many churches provide for the public worship of the inhabitants. The trade of the town is almost exclusively connected with shipping, timber being the chief import; most of the American steamers have their loading berths here. There are large jute-mills, corn-mills, foundries, etc. Bootle has ample railway facilities and tramway cars. The Leeds and Liverpool Canal passes through it. There is a municipal electrical station. The history of the place is included in that of Liverpool. It was incorporated in 1868. Pop. (1901) 58,558.

Boot'on, or **Bou'ton**, an island of the Malay Archipelago, separated by a narrow strait from the southeast ray of Celebes, and from the island of Muna. Area, 1,700 miles. It is high, but not mountainous, and thickly wooded; produces fine timber, rice, maize, sago, etc. The people are Malays. The sultan, who resides at Bolio, is in allegiance to the Dutch, an under-resident being stationed on the island. Pop. 17,000.

Boots and Saddles, or Life in Dakota with General Custer, by Elizabeth B. Custer (1885). The author says that her object in writing this book, which records her experiences in garrison and camp with her husband, was to give civilians a glimpse of the real existence of soldiers in the field. Her married life was not serene; she was left in 1864 in a lonely Virginia farmhouse to finish her honeymoon alone, her husband being summoned to the front; and at scarcely any time during the next 12 years was she free from fear of immediate or threatened peril. Gen. Custer was ordered to Dakota in the spring of 1873. Mrs. Custer's book gives a lively and detailed account of their life there from 1873 to 1876, the time of the general's death. There is an interesting chapter on Gen. Custer's literary habits, and an appendix containing extracts from his letters.

Boots and Shoes. The sandal is the most ancient foot covering of which there is any record. The shoe frequently referred to in the Old Testament, and which played an important part in buying and selling, and in other social usages, was a sandal. The common sandal of the ancient Egyptians consisted of strips of papyrus plaited into a kind of mat, and that form remains the type of sandal of plaited grass or straw worn to this day by multitudes in Central Asia, India, China, and Japan. The sandal was the ordinary shoe of the ancient Greeks. In Greece shoes were used only in exceptional circumstances. Sandals were the everyday wear of the Roman populace; the patricians wore shoes of black leather; red leather shoes were reserved for the senators; and the long buskin, reaching, sometimes, to near the knee, and frequently supplied with a thick sole to add to the apparent stature of its wearer, was appropriated to tragedians and hunters. Boots are said to have been invented by the Carians. They were at first made of leather, afterwards of brass or iron, and were proofs against both cuts and thrusts. It was from this that Homer called the Greeks brazen-booted. The boot only covered half the leg; some say the right boot, which was more advanced than the left, it being advanced in an attack with the sword; but in reality it appears to have been used on either leg, and sometimes on both. Those who fought with darts or other missile weapons advanced the left leg foremost; so that in such cases this only was booted. Boots were much used by the ancients, either for riding on horseback, or walking. The boot was called by the ancient Romans, *ocrea*. The Chinese had a kind of boots made of silk, or fine stuff, lined with cotton, a full inch thick, which they always wore at home. These people are always booted; and when a visit is made to them, if they happen to be without their boots, their guest must wait till they put them on.

The Middle Ages.—Different kinds of half-boots were worn by the Anglo-Saxons and Anglo-Normans; and in the reign of Edward IV., if not earlier, the boot proper, with tops and spurs, was established as an article of knightly dress. In the reign of Charles I., a species of boot, exceedingly wide at the top, made of Spanish leather, came into use; and with Charles II. the highly decorated French boot was introduced as an article of gay courtly attire. Meanwhile the jack-boot had become indispensable in the costume of cavalry soldiers and horsemen

generally; and by William III. and his followers it was regularly naturalized in England. This huge species of boot remained in use in British cavalry regiments until comparatively recent times, and, in a somewhat polished and improved form, it is still worn by the Horse Guards. The jack-boot is almost entitled to be called the parent of the top and some other varieties. Boots with tops of a yellow color were commonly worn by gentlemen in the 18th century. Formerly in France, a great foot was much esteemed, and the length of the shoe, in the 14th century, was a mark of distinction. The shoes of a prince were two feet and a half long; those of a baron two feet; those of a knight 18 inches long.

In America.—The introduction of the boot and shoe industry in America is almost coincident with the first settlement of New England, for it is a matter of history that in the year 1629 a shoemaker named Thomas Beard, with a supply of hides, arrived on board the *Mayflower*. The pioneer of the American boot and shoe trade was accredited to the governor of the colony, by the company in London, at a salary of \$50 per annum and a grant of 50 acres of land, upon which he should settle. Seven years after the arrival of Beard, the city of Lynn saw the inception of the industry which has given it a world-wide fame, for there, in 1636, Philip Kertland, a native of Buckinghamshire, began the manufacture of shoes, and 15 years later the shoemakers of Lynn were supplying the trade of Boston. As early as 1648, tanning and shoemaking was an industry in the colony of Virginia, and history records that a planter named Matthews employed eight shoemakers upon his own premises. Legal restraint was placed upon the business of the cordwainer in Connecticut in 1656, and in Rhode Island in 1706, while in New York the business of tanning and shoemaking is known to have been firmly established previous to the capitulation of the province to the English, in 1664. In 1608 the industry was carried on profitably in Philadelphia, and in 1721 the colonial legislature of Pennsylvania passed an act regulating the materials and the prices of the boot and shoe industry. During the Revolution most of the shoes worn by the Continental Army, as well as nearly all ready-made shoes, sold throughout the colonies, were produced in Massachusetts, and we find it recorded that "for quality and service they were quite as good as those imported from England." Immediately after the Revolution, in consequence of large importations, the business languished somewhat. It soon recovered, however, and was pursued with such vigor that in 1795 there were in Lynn 200 master workmen and 600 journeymen, who produced in the aggregate 300,000 pairs of ladies' shoes. One manufacturer in seven months of the year 1795 made 20,000 pairs. In 1778 men's shoes were made in Reading, Braintree, and other towns in the Old Colony for the wholesale trade; they were sold to dealers in Boston, Philadelphia, Savannah, and Charleston, a considerable portion being exported to Cuba and other West India islands. About the year 1795 the business was established in Milford and other Worcester county towns, where brogans were made, and sold to the planters in the Southern States for negro wear. The custom at this time was for the manufacturer to make weekly trips to Boston with his horse and wagon, taking his goods

BOOTS AND SHOES

in baskets and barrels, and selling them to the wholesale trade.

Early Methods.—Prior to 1815 most of the shoes were hand-sewed, a few having been copper nailed; the heavier shoes were welted and the lighter ones turned. This method of manufacture was changed, about the year 1815, by the adoption of the wooden shoe peg, which was invented in 1811 and soon came into general use. Up to this time little or no progress had been made in the methods of manufacture. The shoemaker sat on his bench, and with scarcely any tools other than a hammer, knife, and wooden shoulder stick, cut, stitched, hammered, and sewed, until the shoe was completed. Previous to the year 1845, which marked the first successful application of machinery to American shoemaking, this industry was in the strictest sense a hand process, and the young man who chose it for his vocation was apprenticed for seven years, and in that time was taught every detail of the art. He was instructed in the preparation of the insole and outsole, depending almost entirely upon his eye for the proper proportions; taught to prepare pegs and drive them, for the pegged shoe was the most common type of foot-wear in the first half of the 19th century; and familiarizing himself with the making of turned and welt shoes, which have always been considered the highest type of shoemaking, requiring exceptional skill of the artisan in channeling the insole and outsole by hand, rounding the sole, sewing the welt, and stitching the outsole. The change from which has been evolved our present factory system began in the latter part of 1700, when a system of sizes had been drafted, and shoemakers more enterprising than their fellows gathered about them groups of workmen, and took upon themselves the dignity of manufacturers. The entire shoe was then made under one roof, and generally from leather that was tanned on the premises; one workman cut the leather, others sewed the uppers, and still others fastened uppers to soles, each workman handling only one part in the process of manufacture. This division of labor was successful from the very start, and soon the method was adopted of sending out the uppers to be sewed by the women and children at their homes. Small shops were numerous throughout certain parts of Massachusetts, where the shoemaker, with members of his family or sometimes a neighbor, received the uppers and under-stock from the factories near by, bottomed the boots and shoes, and returned them to the factories, where they were finished and sent to the market packed in wooden boxes. Thus the industry developed and prospered and was carried on without any further improvement in methods until the introduction of machinery.

Machinery.—The first machine which proved itself of any practical value was the leather rolling machine, which came into use about 1845, and with which it was said "a man could do in a minute what would require half an hour's hard work with a lapstone and hammer." This was closely followed by the wax-thread sewing machine, which greatly reduced the time required for sewing together the different parts that formed the upper, and the buffing machine, for removing the grain from sole leather. Then came a machine which made pegs very cheaply and with great rapidity, and this in turn was followed by a hand-power ma-

chine for driving pegs. In 1855 there was introduced the splitting machine, for reducing sole leather to a uniform thickness. Peg-making and power-pegging machines were soon perfected, and there had appeared a dieing-out machine, which was used for cutting soles, taps, and heels by the use of different size dies. The year 1860 saw the introduction of the McKay sewing machine, which has done more to revolutionize the manufacture of shoes, perhaps, than any other single machine. The shoe to be sewed was placed over a horn and the sewing was done from the channel in the outsole through the sole and insole. The machine made a loop stitch and left a ridge of thread on the inside of the shoe, but it filled the great demand that existed for sewed shoes, and many hundreds of millions of pairs have been made by its use. At the time of the introduction of the McKay machine inventors were busy in other directions, and, as a result, came the introduction of the cable nailing machine, which was provided with a cable of nails, the head of one being joined to the point of another; these the machine cut into separate nails and drove automatically. At about this time was introduced the screw machine which formed a screw from brass wire, forcing it into the leather and cutting it off automatically. This was the prototype of the "rapid standard screw machine," which is a comparative recent invention and is very widely used as a sole fastener at the present time on the heavier class of boots and shoes. Very soon thereafter the attention of the trade was attracted to the invention of a New York mechanic for the sewing of soles. This device was particularly intended for the making of turn shoes, and afterwards became famous as the Goodyear "turn shoe machine." It was many years before this machine became a commercial success, and mention of its progress is made later. Closely following the Goodyear invention came the introduction of the first machine used in connection with heeling—a machine which compressed the heel and pricked holes for the nails—and this was soon followed by a machine which automatically drove the nails, the heel having previously been put into place and held by guides on the machine. Other improvements in heeling machines followed with considerable rapidity, and a machine came into use shortly afterwards which not only nailed the heel but was also provided with a hand trimmer, which the operator swung round the heel immediately after nailing. From these have been evolved the heeling machines in use at the present time. Notable improvements had during this time been made in the Goodyear system, and a machine was made for the sewing of welts which was the foundation of the Goodyear machine now so universally used. This machine sewed from the channel of the insole through upper and welt, uniting all three, and was a machine of the chain-stitch type, which left the loop on the outside of the welt. This machine was closely followed by the introduction of one which stitched the outsole, uniting it to the welt by a stitch made from the channel in the outsole, through outsole and welt. This machine afterwards became famous as the Goodyear "rapid outsole lock-stitch machine." The great demand that existed for shoes of this type made it necessary that accessory machines should be invented, and those which prepared the insole, skived the welt, trimmed the insole,

BOOTS AND SHOES

rounded and channeled the outsole, as well as a machine which automatically rolled or leveled the shoe, and the stitch separating machine were soon produced. These formed the Goodyear welt system which has been the subject of constant improvement up to the present time. Factory-made boots and shoes are now entirely cut out by machinery, the upper are sewn by strong sewing machines, and soles and uppers are fastened together either by (1) sewing, (2) pegging with wooden pegs, (3) riveting with metal pins, or (4) screwing by means of the Standard screw machine. The latter most ingenious apparatus uncoils a reel of screwed brass wire, inserts it into the sole, and cuts off the wire flush with the outsole with remarkable rapidity; and for solidity and durability the work leaves nothing to be desired.

Manufacturing Methods.—The following gives a fair idea of how a pair of shoes is turned out under modern methods in the factory of to-day: First, the cutters are given tickets describing the style of shoe required; the thickness of sole, and whatever other details are necessary. From this ticket the vamp cutter blocks out the vamps and gives them with the ticket to the upper cutter, who shapes the vamps to the pattern and cuts the tops or quarters which accompany them. The trimming cutter then gets out the side linings, stays, facings, or whatever trimmings are needed. The whole is then made into a bundle and sent to the fitting department. Here they are arranged in classes by themselves. Pieces which are too heavy are run through a splitting machine, and the edges are beveled by means of a skiving machine. Next they are pasted together, care being taken to join them at the marks made for that purpose. After being dried they go into the hands of the machine operators. The different parts go to different machines, each of which is adjusted for its particular work. The completed upper next goes to the sole-leather room, in which department machinery also performs the major part of the work. By the use of the cutting machine the sides of leather are reduced into strips corresponding to the length of the sole required. These strips are passed through a powerful rolling machine, which hardens the leather and removes from its surface all irregularities. They are then shaved down to a uniform thickness, also by machinery, and placed under dies which cut them out in proper form. The smaller pieces are died out in the form of lifts or heel pieces, which are joined together to the proper thickness and cemented, after which they are put into presses which give them the greatest amount of solidity. The top lift is not added to the heel until after it has been nailed to the shoe. The remaining sole leather is used for shank pieces, rands, and bottom leveling. For the insole, a lighter grade of leather is used, which, being cut into strips and rolled, is cut by dies to the correct shape, shaved uniformly, and channeled around the under edge for receiving the upper. The counters are died out and skived, by machine, and the welts cut in strips. The uppers and soles are then sent to the bottoming department, where the first operation is that of lasting, the uppers being tacked to the insoles. From the laster they go to the machine operator, where the upper, sole, and welt are firmly sewed together by the machine. The bottom is filled and leveled off and the steel shank inserted.

Next, the bottom is coated with cement, and the outsole pressed on it by a machine. Thence it is sent through the rounding machine, which trims it and channels the sole for stitching. From there it goes again to the sewing machine, which stitches through the welt outside of the upper. The next step is that of leveling, then heeling, both of which processes are accomplished by machinery. The heels are nailed on in the rough and afterwards trimmed into shape by a machine operating revolving knives; a breasting machine shaping the front of the heel. Still another machine drives in the brass nails and cuts them off flush with the top pieces. The edging machine is next used, which trims the edges of both sole and heel. The sole bottom is then sandpapered, blacked, and burnished by machinery, after which the shoe is cleaned, treed, and packed.

Factory Centres.—Prior to 1800 little attempt to establish the shoe industry outside eastern Massachusetts was made. Yet it was not to be expected that other enterprising sections would be content always to depend entirely on New England for so important an article of merchandise as shoes. In New York City and other cities of New York State, especially in Rochester, the industry has attained large proportions, and has reached a perfection not excelled anywhere. In Newark, N. J., where the business was early established, are made many of the finest shoes for men's wear. Philadelphia has made the shoe industry a leader among the many manufacturing industries for which she is celebrated. At Cincinnati and St. Louis ladies' shoes are produced in great quantities, and of a style and finish that have won a reputation. Chicago has taken up the business with an energy that has already placed her in the front rank. Throughout the West, including the Pacific Coast, there are many thoroughly equipped, financially successful shoe factories. Notwithstanding the enterprise of other parts of the country, New England still maintains the lead as the home of this industry. Boston is the center from which are sold nearly all the goods made in New England, amounting to about two-thirds of the entire production of the country. The flourishing New England cities and towns of Lynn, Brockton, Haverhill, Marlboro, Milford, Whitman, and Weymouths, and many others, are built up and maintained solely by the boot and shoe and allied interests. The force which this industry has exerted on the community at large becomes apparent.

Convict Labor.—No account of the manufacture of boots and shoes would be complete without reference to the employment of convict labor. The business offers many advantages to the authorities of prisons who are seeking remunerative work for the men and women in their charge. The great number of operations in producing a shoe makes it possible to use all classes of convicts, from the strong to the weak; and as far back as 1850, even before machinery was introduced, it was not an uncommon thing for houses of correction and prisons to produce footwear not only for their own convicts, but to be sold in the market. After the introduction of machinery, and during the demand for cheap shoes, which followed the close of the Civil War, many of the states leased the labor of their convicts to shoe manufacturers. In the year 1870 there were employed in this industry in 26 different States, 6,581 convicts,

BORA

while there were only 129,989 employed in the industry in the same States outside the prisons. In the year 1900 there were made by 7,609 convicts, 6,634,960 pairs of shoes, valued at \$10,990,173, and it is probable that the number employed and the annual production are steadily increasing. In States where the system was believed to have a harmful influence on the wages of the workman outside the prisons, the business has been conducted on the States' account, and in some instances, at least, the result has been disastrous.

Export Trade.—Early manufacturers shipped goods to the West Indies, more especially to Cuba, and up to the time of the Civil War the export business was prosecuted with considerable vigor and profit. In 1810, 10 per cent of all the boots and shoes sold in Boston were for export. In the year 1865 shoes to the value of more than \$2,000,000 were exported. From that time the trade fell off sharply. This may be accounted for by the great advance in 1866, when values rose at least 50 per cent. Since 1895 interest has been renewed in the export trade. Manufacturers have become convinced that there is nothing in the conditions which will prevent competition with foreign countries. The raw materials are available, and, while many hides and skins are imported, the supply of the domestic product is constantly increasing and leather manufacturers have been able to produce materials for making boots and shoes as advantageously, both in regard to quality and price, as any other country. Styles have been adapted to the wants of such countries as import their footwear. Many of the leading manufacturers are alive to the situation and are endeavoring to secure a greater share of the world's trade. The following tabular statement shows the value of the exports of leather boots and shoes from 1870 to 1901:

YEARS.	VALUES.
1901.....	\$5,526,290
1900.....	4,276,656
1899.....	2,711,385
1898.....	1,816,538
1897.....	1,708,224
1896.....	1,436,686
1895.....	1,010,228
1894.....	777,354
1893.....	590,754
1892.....	914,974
1891.....	651,343
1890.....	662,974
1885.....	598,151
1880.....	441,069
1875.....	429,363
1870.....	419,612

The exports, with the exception of the year 1865, appear to have been unimportant until 1895, when the first decided gain was made, the exports for that year being valued at \$1,010,228. Since that date there has been a steady increase until, in 1901, these exports amounted to \$5,526,290. The maximum yearly capacity of the combined factories of the United States, on a basis of 300 working days, is slightly under 400,000,000 pairs, showing that all the factories running at full capacity would require not exceeding seven months to produce all shoes consumed in the United States, and those exported for the year ending 30 June, 1900.

Statistics of Manufacture.—In 1901 a capital of \$101,795,233 was invested in the manufacture of boots and shoes. This sum represents the value of the land, buildings, machinery, tools, and implements, but does not include the capi-

tal stock of any of the manufacturing corporations of the State. The value of the products was \$261,028,580, to produce which involved an outlay of \$7,757,749 for salaries of officials, clerks, etc., \$59,175,883 for wages, \$10,766,402 for miscellaneous expenses, including rent, taxes, etc., and \$169,604,054 for materials used, mill supplies, freight, and fuel.

The following table gives the leading statistics of the boot and shoe industry in the United States from 1880 to 1900:

	1900	1890	1880
Number of establishments.....	1600	2082	1959
Capital.....	\$101,795,233	\$95,282,311	\$42,994,028
Wage-earners.....	142,922	133,690	111,152
Total wages.....	59,175,883	60,667,145	43,001,438
Miscellaneous expenses.....	10,766,402	9,217,519	
Cost of material used.....	169,604,054	118,785,831	102,442,442
Value of products.....	261,028,580	210,049,353	166,050,354

The output of 12 leading manufacturing cities for 1890 and 1900 was as follows:

Cities.	1900		1890	
	Rank.	Value of Product.	Rank.	Value of Product.
Brockton, Mass.....	1	\$19,844,397	1	\$16,171,624
Lynn, Mass.....	2	16,830,735	1	20,190,695
Haverhill, Mass.....	3	15,231,440	3	16,137,352
Cincinnati, Ohio.....	4	8,788,444	7	6,024,454
St. Louis, Mo.....	5	8,286,156	9	4,250,960
Rochester, N. Y.....	6	6,933,111	6	6,489,352
Philadelphia, Pa.....	7	5,931,045	5	6,851,834
Brooklyn, N. Y.....	8	5,733,432	12	2,489,885
Chicago, Ill.....	9	5,723,126	4	7,257,034
Auburn, Me.....	10	4,176,826		
Manchester, N. H.....	11	4,052,204	23	39,024
Boston, Mass.....	12	3,882,655	17	1,508,697

The total quantity of boots and shoes manufactured in 1900 was 219,235,419 pairs, an increase over 1890 of 45,372,479 pairs. This is about the same as the percentage of increase in population for the United States. In 1900 89,123,318 pairs of men's, youth's, and boys' boots and shoes were manufactured, valued at \$129,505,235. Women's, misses', and children's shoes were made to the number of 107,415,855 pairs, valued at \$112,823,914. Slippers were produced for men, youths, and boys to the number of 4,456,965 pairs, valued at \$2,812,213. Another item "slippers, oxfords, and low cuts for women, misses, and children," is represented by 12,655,876 pairs, valued at \$10,146,393. In 1900 capital to the amount of \$33,667,533 was invested in the manufacture of rubber boots and shoes, with a total product valued at \$41,089,819.

FREDERICK D. HULL,
Vice-President 'The Shoe Retailer,' New York and Boston.

Bora, Katharina von, wife of Luther: b. 29 Jan. 1499; d. 20 Dec. 1552. She took the veil very early in the nunnery of Nimptschen, near Grimma; but feeling very unhappy in her situation, applied, with eight other nuns, to Luther, whose fame had reached them. Luther gained over a citizen of Torgau, by the name of

BORACIC ACID—BORASSUS PALM

Leonard Koppe, who, in union with some other citizens, undertook to deliver the nine nuns from their convent. This was done the night after Good Friday, 4 April 1523. Luther brought them to Torgau, and from thence to Wittenberg. At the same time, to anticipate the charges of his enemies, he published a letter to Koppe, in which he frankly confessed that he was the author of this enterprise, and had persuaded Koppe to its execution; and he also exhorted the parents and relations of the virgins to admit them again into their houses. Some of them were received by citizens of Wittenberg; others who were not yet too old Luther advised to marry. Among the latter was Katharina, whom Philip Reichenbach, at that time mayor of the city, had taken into his house. Luther proposed to her several of his friends. She declined these proposals, but declared her willingness to bestow her hand on Nicholas von Amsdorf, or on Luther himself. Luther, who in 1524 had laid aside the cowl, was not averse to matrimony, yet appears to have been led to the resolution of marrying by reason rather than by passion. This step gave rise to many disadvantageous rumors, some of them as shameful as they were unfounded. After Luther's death Katharina removed from Wittenberg to Leipsic, where she was compelled to take boarders for her support. She afterward returned to Wittenberg and finally removed to Torgau, where she died. In the Church of Torgau her tombstone is still to be seen, on which is a life-size image of her.

Boracic (-ras'-) **Acid**, or **Bo'ric Acid** (from "borax"), a compound of boron with oxygen and hydrogen, having the formula H_2BO_3 , and possessing feebly acid properties. It occurs in an impure state in the crater of Vulcano, one of the Lipari islands. It is also found plentifully in Tuscany, where it issues from fissures in the soil, together with sulphurous exhalations, ammonia, and other substances. On account of its having been obtained at Sasso, the acid is called by mineralogists Sassolite. The principal supply of boracic acid is obtained from Tuscany, the exhalations above referred to being passed through water which absorbs the acid. The preparation of boracic acid from these aqueous solutions is an interesting process on account of the natural obstacles which have to be surmounted. The apparently simple operation of concentrating the solution, so as to obtain the acid by crystallization, in reality involves great practical difficulties, because in Tuscany the fuel supply is limited. This drawback has been overcome by utilizing the volcanic heat of the district to concentrate the solution. Around the cracks in the soil (called "fumaroles" or "soffioni"), from which the steam containing the acid issues, and enclosing the small lakes or lagoons in which it condenses, brick tanks are built on different levels, but communicating with each other. These are supplied with cold water, in which the steam is further condensed. When the water in the tanks is sufficiently saturated, it is run off into a deep vessel, where it is allowed to stand until the black mud mechanically suspended in it falls to the bottom, and then the clear fluid is run into a series of shallow evaporating pans of lead. These pans are heated by steam from the soffioni, the steam being made to pass under them by a system of flues. As the evaporation proceeds the fluid becomes richer in boracic acid, and when it attains a cer-

tain specific gravity, it is passed into a deep vat, where it is allowed to cool. Boracic acid then crystallizes out. The first crop of crystals is quite impure, but it is improved by re-crystallization, and the second crop as thus obtained is packed in casks and exported. Commercial boracic acid sometimes contains as much as 25 per cent of foreign matter, consisting largely of clay, salts of calcium and magnesium, and sulphates and other salts of the alkalis. About 2,000 tons of crude boracic acid are exported from Tuscany per annum. Boracic acid is also prepared artificially by decomposing a hot solution of borax with sulphuric acid. The boracic acid separates out upon cooling. Boracic acid is a white, glassy substance, slightly soluble in cold water, and considerably more soluble in hot water. It possesses strong antiseptic properties, and is used as a preservative for meat. It is also used for glazing porcelain, and in the manufacture of certain kinds of glass. Boracic acid forms salts called "borates" with various metallic bases, of which borax (q.v.) is the most important. See BORON.

In medicine, boracic acid is used very widely. It is a mild antiseptic, and its solutions are useful for cleansing the eyes, nose, mouth, bladder, etc. It forms with aromatic oils the basis of most mouth washes and nasal sprays. Boracic acid is also very useful in the nursery for keeping nipples free from bacteria, and it is of great service in washing out nursing-bottles, babies' mouths and eyes, and the mother's nipples while nursing. Large doses may prove poisonous.

Bo'racite (from "borax"), a mineral, tetrahedral and isomeric in external form, but orthorhombic in molecular structure, and becoming isotropic only when heated to 510° F. It has the composition $6MgO.MgCl_2.8B_2O_3$, and a little iron is also occasionally present, probably as an impurity. It occurs in beds of anhydrite, gypsum, and salt, notably at Stassfurt, Prussia, also in crystals at Lüneberg, Hanover and Westeregeln, Saxony. The mineral has been prepared artificially by melting together 10 parts of boracic acid, 100 of sodium chloride, and 5 of magnesium borate. Boracite is strongly pyroelectric. Its molecular structure has been the subject of much study, on account of its exhibiting double refraction, although the mineral is apparently isomeric in crystalline form.

Borage, the small genus, typical of the natural order *Boraginaceae*, the species of which are most numerous in the Mediterranean region. Common borage (*Borago officinalis*), a coarse growing annual herb frequent in waste places, is about two feet tall with erect stem, rough, hairy leaves, and blue flowers arranged in racemes. Like many other innocuous plants, borage was highly valued medicinally, but is now not so employed. It is occasionally raised as a pot herb or salad plant, its young leaves being palatable. The flowers are still used to make the beverage known as cool tankard, a mixture of wine, lemon, sugar, and water. The plant's chief use, however, is as bee pasturage, its flowers being rich in nectar.

Boras, Sweden, a town in the province of Elfsborg, 36 miles east of Gothenburg. It was founded by Gustavus Adolphus in 1632. There are some cotton and linen manufactures, and also some dyeworks. Pop. (1903) 15,837.

Borassus Palm. See PALMYRA PALM.

BORAX — BORDEAUX

Bo'rax, a compound of the metal sodium with boracic acid (q.v.). The formula of boracic acid may be written $\text{HBO}_2 + \text{H}_2\text{O}$; and if the hydrogen of the HBO_2 is replaced by sodium, a compound known as sodium borate is formed, which crystallizes as $\text{NaBO}_2 + 4\text{H}_2\text{O}$. Fused borax is this salt deprived of its water of crystallization, and combined with boron trioxide in the form $2\text{NaBO}_2 + \text{B}_2\text{O}_3$, or $\text{Na}_2\text{B}_4\text{O}_7$. Common borax, when crystallizing from aqueous solution, however, contains 10 molecules of water. Other forms of borax are easily obtained, crystallizing with different quantities of water. Borax occurs native, both as a saline efflorescence on the soil, and as monoclinic crystals. Until recent times the principal borax supply of the world was obtained from the salt lakes of Tibet. It was brought to Europe in the crude state, under the name of Tincal. Enormous quantities of borax are now obtained from California and Nevada. Borax Lake, some 80 miles north of San Francisco, was discovered in 1856. It contains borax in solution, and crystals of the mineral also occur in the surrounding mud and marshes. The crystals are occasionally quite large, weighing as much as a pound each. It is also found in large quantities at Borax Lake in San Bernardino County, Cal., and it occurs abundantly as an efflorescence in Death Valley, Inyo County, Cal. Borax is extensively used in the household, and it is used also as an antiseptic and preservative. Like boracic acid, it is employed in glazing porcelain. Its property of dissolving metallic oxides makes it of great value in blowpipe analysis (q.v.) and as a flux in the soldering of metals. In the United States commercial borax is chiefly derived from the colemanite deposits of California.

Borax is of toxicological interest because it is widely used as an antiseptic, a preservative for meats and other foodstuffs, and also as an abortifacient. In large doses there is marked gastro-enteritis, in addition to which there are symptoms of collapse, coldness of the skin, bad pulse, psychical depression, and diminution in the quantity of urine eliminated. Similar symptoms may occur from the use of borax in washing out large abscess cavities. Singultus and general motor paralysis are the symptoms in fatal cases. Borax certainly has atoxic action on the kidneys when taken in large amounts. There is albumen in the urine, casts, pain in urination, and even bloody urine. While the kidneys are markedly affected by large doses it is questionable whether borax, in the small amounts used in food preservation, causes any grave symptoms of kidney irritation, even when taken for a considerable length of time. It may well be that certain individuals have an idiosyncrasy to boron salts, in which case their use would prove detrimental. See BORON.

Borchgrevink, Carsten Egeberg, Norwegian explorer and lecturer: b. Christiania, 1864, his mother being English and his father a Scandinavian. He went to sea at an early age, but returned to go to college. In 1898 he went to Australia, joined the survey department, and scaled Mount Lindsay. In 1894-5 he was in Antarctic waters, a region more fully explored by him in 1897, when he attempted to reach the South Pole without success. In 1899 (17 February) he had, however, reached Robertson Bay. Returning to London in 1900 he reported hav-

ing reached lat. 78.50 S.; lon. 195.50 E., the farthest point south ever reached by man. Consult his work, 'First on the Antarctic Continent.'

Borda, Jean Charles, French engineer, and afterward a captain in the French marine, famous for his mathematical talents: b. Dax, department of Landes, 4 May 1733; d. 20 Feb. 1799. In 1756 he was chosen a member of the Academy of Sciences, and occupied himself in making experiments on the resistance of fluids, the velocity of motion, and other topics relating to dynamical science. In 1767 he published a dissertation on hydraulic wheels, and afterward one on the construction of hydraulic machinery. In 1771, with Verdun de la Crenne and Pingre, he made a voyage to America, to determine the longitude and latitude of several coasts, isles, and shoals, and to try the utility of several astronomical instruments. In 1774 he visited the Azores, the Cape Verde Islands, and the coast of Africa for the same purpose. In the American war he was very useful to the Count d'Estaing by his knowledge of navigation. Borda was the founder of the schools of naval architecture in France. He invented an instrument, of a very small diameter, which measures angles with the greatest accuracy, and which has been used in measuring the meridian; the reflecting circle, which has made his name immortal; besides an instrument for measuring the inclination of the compass-needle, and many others. On the establishment of the National Institute, he became one of its members, and was occupied with other men of science in framing the new system of weights and measures adopted in France under the republican government. Among the latest of his labors was a series of experiments to discover the length of a pendulum which should vibrate seconds in the latitude of Paris. The principal of his writings are: 'His Voyage' and his 'Tables Trigonométriques Décimales.'

Bordeaux, France, capital of the department of Gironde, is situated on the left bank of the Garonne, about 70 miles from the sea, and 284 southwest of Paris. It is built in a crescent form round a bend of the river, which is lined with fine quays for more than three miles, and is crossed by a magnificent stone bridge of 17 arches, finished in 1821 at a cost of \$1,200,000. There is another bridge, a fine iron structure, for the railway from Paris. Bordeaux consists of an old and a new town, the boundary between them being formed by a wide and handsome street which, commencing at the quay near the centre of the crescent, stretches across the city from east to west. The objects chiefly deserving of notice in the old town are the arch called the Porte de Bourgogne at the extremity of the bridge, forming the principal entrance to the town; the cathedral, a fine Gothic edifice built at different periods; St. Michael's Church, with a lofty detached tower, and a superb front of florid Gothic; the Church of St. Croix, a specimen of gorgeous Romanesque; the bourse or exchange, the custom-house, the Hôtel de Ville, once the residence of the archbishops of Bordeaux, and the Palais de Justice. The new town is not so rich in public buildings. The most conspicuous are the library (200,000 volumes), the museum, and the theatre, a Grecian structure, regarded as the handsomest edifice

in Bordeaux. Among the beneficent establishments the first place is due to the grand hospital or infirmary, which occupies the highest site in the town and is admirably arranged. Few cities are so well supplied with extensive and finely planted promenades. Bordeaux is the seat of a court of appeal, of courts of the first instance and of commerce; and has an academy of science, literature, and art; a preparatory school of medicine and pharmacy; a lyceum; a normal school for female teachers; a school of hydrography and navigation; a school of painting and design; a botanic garden, an observatory, various literary and scientific associations and a branch of the Bank of France. There are consuls resident here from all the states of Europe and America. The position of Bordeaux gives it admirable facilities for trade, and enables it to rank next after Marseilles and Havre in respect of the tonnage employed. Large vessels can sail up to the town, which by railway, river, and canal communicates with the Mediterranean, with Spain, and with the manufacturing centres of France. The chief exports are wine and brandy; drugs, dyes, and fruits are also largely exported. Sugar and other colonial produce and wood are the chief imports. Ship-building is the chief branch of industry, and there are also sugar-refineries, woolen and cotton mills, potteries, soap-works, distilleries, etc.

Bordeaux is the Burdigala of the Romans. In the 5th century it was in possession of the Goths, and it was pillaged and burned by the Normans. By the marriage of Eleonor, daughter of the last Duke of Aquitaine, to Louis VII., it fell into the hands of France. But in 1152 the princess was repudiated by her husband, and married to Henry of Anjou, who ascended the throne of England in 1154, as Henry II., and transferred Bordeaux to that crown. After the battle of Poitiers, Edward the Black Prince carried John, king of France, prisoner to Bordeaux, where he resided 11 years. Under Charles VII., in 1451, it was restored again to France. In 1548 the citizens rebelled on account of a tax on salt, and the governor, De Morems, was put to death, for which the constable of Montmorency inflicted a severe punishment on the city. During the revolution it was devastated as the rendezvous of the Girondists, by the Terrorists, almost as completely as Lyons and Marseilles. The oppressiveness of the continental system to the trade of Bordeaux made the inhabitants disaffected to the government of Napoleon, so that they were the first to declare for the house of Bourbon, 12 March 1814. The Roman poet, Ausonius, was a native of Bordeaux. Montaigne and Montesquieu were born in the neighboring country, and the latter lies buried there in the Church of Saint Bernard. Pop. (1903) 268,330.

Bordeaux Mixture. See FUNGICIDES.

Bordeaux Wines. The finer red wines of the country around Bordeaux are the best which France produces. They contain but little alcohol, keep well, and even improve by removal. As the original fermentation is complete, they are, if judiciously managed, less subject to disorder and acidity than the Burgundy wines. None of the very best quality, however, is exported pure; a bottle of the best Château-Margaux, or Haut-Brion, is a rarity hardly to be procured in Bordeaux itself, at the rate of six

or seven francs a bottle. For export, the secondary growths of Médoc are mingled with the rough Palus. The red wines of Bordeaux are known in America under the name of claret. They have less aroma and spirit, but more astringency than the Burgundy wines. They are the safest wines for daily use, as they are among the most perfect of the light wines, and do not easily excite intoxication. In this respect they contrast with the Burgundy wines, which have more generous qualities than those of Bordeaux, although these wines have sometimes been accused of producing the gout, but this disparagement is without reason. Persons who habitually drink madeira, port, etc., and indulge in an excess of claret, may indeed be visited in that way; because a transition from the strong, brandied wines to the lighter is always followed by a derangement of the digestive organs.

The principal vineyards are those of Médoc, Graves, Palus, and Vignes Blanches; after these, those of Entre-deux-Mers, Saint Emilion, and the Bourgeois are the most important. The first growth of Médoc are the famous wines of Château-Margaux, Lafitte, and Latour. The Lafitte is characterized by its silky softness on the palate, and a perfume partaking of violet and raspberry. The Latour is fuller, has more aroma but less softness. The Château-Margaux is lighter than the Latour, and delicate like the Lafitte, but has not so high a flavor. Of the second growth, we may mention the Rauran and the Léoville. The average produce of the first growth is 217,000 gallons. The soil of Médoc is a sandy and calcareous loam. The gravelly lands (*les Graves*) to the south and west of Bordeaux produce the Graves. The first growth of the red Graves is the Haut-Brion, which rivals the first growth of Médoc; it has more color and body, but is inferior in aroma and taste. The principal white Graves are Saint Bris and Carbonieux. The best Médoc ought to be kept three or four years before removal; the Graves five or six. The wines of Palus, which is a bed of rich alluvial deposits, are inferior to the preceding; they are stronger and more deeply colored than those of Médoc. Being hard and rough, they are improved by a voyage, and are principally sent to the East Indies and America as *vins de cargaison*, or are mixed with Médoc which is intended for exportation. By the voyage they become more light and delicate, but are not to be compared with the growths of Médoc and the Graves. The best are Queyries and Mont Ferrand. The former are deeply colored, and have much body. Age gives them an agreeable aroma, resembling that of a raspberry.

Among the white Bordeaux wines, besides those already mentioned, the finest growths are Sauternes, Preignac, Barsac, and Bommes. Martillac and Saint Médard are of a good quality, and have lightness and body. Dariste, formerly Dulamon, is equal to Saint Bris and Carbonieux. Among other red wines are the Bourgeois, which are of a fine color, and acquire by age lightness and an agreeable almond aroma; of all the Bordelais wines they most resemble the Burgundy wines. The first growths are Debosquet, Château-Rousset, Tajac, and Falfax. The Bourgeois wines were formerly preferred to Médoc. The wines of Saint Emilion have been much esteemed. The Fronsac and Canon are the best. Those of Entre-deux-Mers become

agreeable with age. The *vins des Côtes* are good *vins ordinaires*; they are generally *fermes* and hard, and improve by age. The best are those of Bassens and Cenon. Consult Henderson's 'History of Ancient and Modern Wines.'

Borden, Simeon, American inventor and surveyor: b. Fall River, Mass., 29 Jan. 1798; d. 28 Oct. 1856. He instructed himself in mathematics and devised successful surveying instruments. The first American geodetic survey was his work. In 1846 he began the construction of railroads.

Bordentown, N. J., a city on the Delaware River, the Delaware and Raritan Canal, and the Pennsylvania R.R.; 57 miles southwest of New York. It is noted as being a former residence of Joseph Bonaparte (q.v.), brother of Napoleon I., and for many years the house and grounds belonging to the estate possessed much interest for the tourist. The city is the seat of the Bordentown Military Institute, the St. Joseph's Academy for girls (Roman Catholic), and the Bordentown Female College. There are steam forge and iron works, foundry and machine shops, worsted mills, shirt factory, canning factories, a shipyard and other industries. The city was incorporated in 1866. Pop. (1900) 4,110.

Border Ruffians, a name given, after the Kansas-Nebraska Bill of 1854, to the pro-slavery Missourians who acted as the allies of the slave element in Kansas, crossing the boundary to vote, by which means they organized the first government against the *bona-fide* free-labor residents by a vote of nearly double the inhabitants of the Territory. They kept the State in anarchy for three years, terrorizing the inhabitants by murder, arson, the sack of towns, and other outrages. The most graphic comment is the fact that they adopted this term of their enemies and prided themselves on it as an excellent joke. See KANSAS-NEBRASKA BILL.

Border States, before the War, the line of slave States lying next the free States: Delaware, Maryland, Virginia, Kentucky, and Missouri. The term was sometimes improperly made to include North Carolina and Tennessee, probably because their mountain districts held so large a proportion of loyalists; and Arkansas, for no special reason. Their political position was dictated by the facts that: (1) After the prohibition of the slave trade one of their chief industries was breeding slaves for exportation to the cotton, rice, and sugar plantations of the southernmost States. In the Virginia convention of 1832 it was said to be the most profitable in the State. (2) From their position they were the chief sufferers from the escape of fugitive slaves; in 1850 this was estimated at a loss of \$3,000,000 a year, and these States were the most insistent advocates of the Fugitive Slave Law and its enforcement; and in 1860 a Missouri senator urged the creation of a Federal police to patrol the border line for this purpose. (3) In case of war they would be the chief battlefield. They therefore furnished the backbone, if not the genesis of every political movement to stop the slavery agitation or conciliate the sections. The strength of the Know-Nothing party of 1856 and the Constitutional Union party of 1860 (Bell-Everett) was almost exclusively in the border States; the Peace Conference of 1861 and the proposed Crittenden Compromise were the work of these States. They tried to prevent the

outbreak of hostilities, and when the war began the governor of Kentucky went so far as to attempt making his State a neutral power outside both governments, and forbade either of them occupying it without the consent of the State authorities. Finally, however, they split up according to their natural affinities; the three not border States at all—North Carolina, Tennessee, and Arkansas—seceded, with Virginia; while in Kentucky, Maryland, Delaware, and Missouri, the loyal element, with government help, prevented the State from going out. They never gave up hope through the war, however, of reconciling differences by a convention of all the old States, North and South.

Border War, a name given during the struggle for Kansas to the intermittent civil war in that Territory, about 1854-8, between the free-soil and the slavery parties. It was begun by the attempt of the Missouri slaveholding party ('Border Ruffians,' q.v.) to reclaim by violence what the actual settlers had won by colonization; many of the worst atrocities were perpetrated, and all the temporary success of the slavery side won, by bodies of men who were not residents of Kansas at all. This caused up John Brown (q.v.) to move there from northern Ohio with his sons, and fight against them. Of the other partisan leaders on that side, the most notable was James Montgomery, who, however, was a *bona fide* settler. The most efficient leaders among the Missourians, or border ruffians, were James R. Atchison of Missouri and the Federal courts.

Bordighera, Italy, a town on the Mediterranean coast, in the district of San Remo and province of Porto Maurizio, a favorite winter residence for invalids, having been made fashionable by the visits of the members of the English royal family. Few places on the Riviera are better fitted for the accommodation of invalids and tourists. In addition to the usual facilities for the entertainment of strangers, the town has a library, museum, and a theatre. Pop. (1903) about 6,000.

Bordone, Paris, Italian painter of the Venetian school: b. Treviso, 1500; d. 1570. Under Titian he made rapid progress in painting. The execution of many works for his native city and for Venice spread his fame as far as France, whither he was invited by the king. The galleries of Dresden and Vienna possess several of his pieces. His most famous picture is the 'Old Gondolier Presenting a Ring to the Doge'; it is considered one of the masterpieces of the Venetian school. Other examples of his work are: 'Prophecy of the Tiburtine Sibyl,' in Florence; 'Combat of the Gladiators,' in Vienna, and 'The Chess Players,' in Berlin.

Bore, a word probably of Icelandic origin, and used to designate a very remarkable phenomenon which occurs in some rivers in spring-tides. At such times as the tide advances the water is suddenly thrown in as if in a mass, and then pursues its course up the river, and in opposition to the current, presenting a volume of water moving with great rapidity and resistless force, and with a height varying from two or three feet, as in the Severn, Trent, Solway, and Dee, to more than 12 feet in the Brahmaputra, and Tsien-Tangkiang. The last is said

to have a rise of 20 feet, and advances with a loud roar, at the rate of 10 miles an hour. The tide in the Bay of Fundy rises with great rapidity, and is sometimes spoken of as the bore of Fundy. The circumstances in which the bore occurs afford an easy explanation of its cause, and show that it is produced by the disproportion between the volume of the tidal wave and the receiving power of the rivers into which it is thrown.

Bore, the cavity of a steam engine cylinder, pump barrel, pipe, cannon, barrel of a firearm, etc. In mechanics it is expressed in inches of diameter; in cannon formerly in the weight in pounds of solid round shot adapted thereto, but since the introduction of modern rifled ordnance of the breech loading pattern, the bore of cannon is always expressed in inches of diameter or in the equivalent of inches.

Boreas, the north wind, worshipped by the Greeks as a deity; residing in Thrace, and represented with wings, which, as well as his hair and beard, were full of flakes of snow; instead of feet he had the tails of serpents, and with the train of his garment he stirred up clouds of dust. Boreas was the son of Astræus and of Eos. When Apollo and his favorite Hyacinthus were once playing at quoits, he blew the quoit of the former, of whom he was jealous, upon the head of the youth, who was killed by the blow. By Oreithyia, daughter of Erechtheus of Athens, he was father of Cleopatra, Chione, Calais, and Zetes. The last two took part in the Argonautic expedition.

Borecole, a pot-herb. See KALE.

Boregat. See ROCK TROUT.

Borelli, Giovanni Alfonso, Italian physician and scientist: b. Naples, 1608; d. Rome, 31 Dec. 1679. After studying medicine he both practised and professed it at various places, but particularly at Pisa and Florence, and distinguished himself as the leader of those who have been called mathematical physicians, from regarding the human body as a kind of hydraulic machine, and then attempting to explain all its motions and functions in accordance with the principles of mathematics. He appears to have possessed very original and inventive powers, and made various discoveries, among which may be mentioned that of an apparatus apparently of the nature of a diving-bell, by which persons could descend into the water, remain in it and move about or rise and sink at pleasure, and of a boat by which two or more persons might row themselves beneath the water in any direction. His works discuss many important subjects in medicine, mathematics, and philosophy; but the great work on which his fame rests, though not published till after his death, is entitled 'De Motu Animalium,' and in so far as it relates to mere animal mechanics is full of interest and instruction; but when he attempts to apply his mathematical principles he falls into egregious blunders, and stumbles at every step.

Borelli's Comet. See COMET.

Borer, Round-headed and Flat-headed, insect enemies of several trees. See APPLE.

Borghese, the name of a patrician family of Sienna, Italy, which has been more or less distinguished since the middle of the 15th cen-

tury. A juriconsult, of the name of Marco Antonio Borghese, who was employed by the papal court in the early part of the 16th century, appears to have laid the foundation of its fortunes at Rome. His third son, Camillo, became Pope Paul V. (q.v.), in 1605, and he lavished the honors and riches which his place enabled him to command on his relatives. For a son of his elder brother, named Marco Antonio Borghese, he procured the principedom of Sulmona and a grandeeship in Spain. His brother, Francesco, he made the leader of the troops sent against Venice in 1607, to maintain the papal cause against the opposition of that republic. Scipione Caffarelli, a nephew, he created cardinal. Paolo, the son of Marco Antonio, married Olympia Aldobrandini, the only child of the prince of Rossano, and grandniece of Clement VIII., and thus introduced the wealth of the Aldobrandini into the Borghese family. The son of Paolo, named Giovanni Battista, was the ambassador of Philip V. to the court of Rome, where he died in 1717. His son, Marco Antonio, was viceroy of Naples in 1721, and another of the same name, descended from him, became a noted collector of works of art, with which he adorned his sumptuous villa on the Pincian hill. See BORGHESE, CAMILLO PHILIP.

Borghese, Camillo Philip Louis, formerly Duke of Guastalla, Prince of France, etc.: b. 1775; d. Florence, 10 April 1832. When the French invaded Italy he entered their service, and showed great attachment to the cause of France, in particular to Gen. Bonaparte, whose sister, Marie Pauline (q.v.), he married. In 1804 he became a French prince, and grand cross of the Legion of Honor, and at the breaking out of the war against Austria in 1805, commander of a squadron of the imperial guard. After its termination his wife received the duchy of Guastalla, and he was created Duke of Guastalla. After having served in 1806 in the campaign against the Prussians and Russians, and after having been sent to Warsaw to prepare the Poles for a revolt, the emperor appointed him governor-general of the provinces beyond the Alps. He fixed his court at Turin, and became very popular among the Piedmontese. After the abdication of Napoleon he broke up all connection with the Bonaparte family, and separated from his wife. The prince sold to the French government for the sum of 8,000,000 francs 322 works of art which ornamented the palace of his ancestors, known under the name of the Villa Borghese. Among them were several masterpieces: for example, the 'Borghese Gladiator,' the 'Hermaphrodite,' the 'Silenus,' the 'Dying Seneca,' 'Amor and Psyche.' Bonaparte provided for the payment out of the national domains in Piedmont, which the king of Sardinia confiscated in 1815; at the same time, in consequence of the second invasion of France, the prince received back part of these treasures of art. In 1818 he sold Lucedio, in Savoy, for 3,000,000 livres. In the kingdom of Naples he possessed the principalities Sulmona and Rosano. He was one of the richest Italian princes.

Borghese, Marie Pauline (PRINCESS), sister of Napoleon: b. Ajaccio, 20 Oct. 1780; d. 9 June 1825. When the English occupied Corsica in 1793 she went to Marseilles, where she was on the point of marrying Fréron, a member of the Convention, and son of that critic whom

Voltaire made famous, when another lady laid claim to his hand. The beautiful Pauline was then intended for Gen. Duphot, who was afterward murdered at Rome in December 1797; but she bestowed her hand from choice on Gen. Leclerc, then at Milan, who had been in 1795 chief of the general staff of a division at Marseilles, and had there fallen in love with her. When Leclerc was sent to St. Domingo with the rank of captain-general, Napoleon ordered her to accompany her husband with her son. She embarked in December 1801, at Brest, and was called by the poets of the fleet, the Galatea of the Greeks, the Venus Marina. Her statue, in marble, as Venus, was made by Canova at Rome—a successful image of the goddess of beauty. She was no less courageous than beautiful, for when the negroes under Christophe stormed Cape François, where she resided, and Leclerc, who could no longer resist the assailants, ordered his lady and child to be carried on shipboard, she yielded only to force. After the death of her husband she married at Morfontaine, in 1803, the Prince Camillo Borghese (q.v.). Her son died at Rome soon after. With Napoleon, who loved her tenderly, she had many disputes and as many reconciliations, for she would not always follow the caprices of his policy. Yet even the proud style in which she demanded what her brothers begged made her the more attractive to her brother. Once, however, when she forgot herself toward the empress, whom she never liked, she was obliged to leave the court. She was yet in disgrace at Nice when Napoleon resigned his crown in 1814, upon which occasion she immediately acted as a tender sister. Instead of remaining at her palace in Rome, she set out for Elba to join her brother, and acted the part of mediatrix between him and the other members of his family. When Napoleon landed in France she went to Naples to see her sister Caroline, and afterward returned to Rome. Before the battle of Waterloo she placed all her diamonds, which were of great value, at the disposal of her brother. They were in his carriage, which was taken in that battle, and was shown publicly at London. He intended to have returned them to her. She lived afterward separated from her husband at Rome, where she occupied part of the palace Borghese, and where she possessed, from 1816, the Villa Sciarra. Her house, in which taste and love of the fine arts prevailed, was the centre of the most splendid society at Rome. She often saw her mother, her brothers Lucien and Louis, and her uncle Fesch. When she heard of the sickness of her brother Napoleon, she repeatedly requested permission to go to him at St. Helena. She finally obtained her request, but the news of his death arrived immediately after. At her death she left many legacies, and a donation, the interest of which was to enable two young men of Ajaccio to study medicine and surgery. The rest of her property she left to her brothers, the Count of St. Leu and the Prince of Montfort. Her whole property amounted to about \$500,000.

Borghesi, Bartolommeo (COUNT), Italian numismatist: b. Savignano, 11 July 1781; d. 16 April 1866. His attention was devoted to elucidating, through the study of inscriptions, several obscure points in Roman history; and the books he published secured for him a great

reputation among the learned. He completed, after more than 30 years' labor, a full chronological list of the Roman consuls, embracing all the modern discoveries on the subject, with disquisitions on the most important questions connected with Roman antiquities. After his death a complete collection of his writings was ordered by the Emperor Napoleon, but it was not until 1897 that the work was finished.

Borgi, Giovanni, jō-vān'nē bōr-jē, the originator of ragged schools: b. Rome, about 1736; d. about 1802. He was a mason by trade, and after his daily toil was completed, he was in the habit of attending the sick in the hospital of Santo Spirito, spending entire nights in his labor of love, and frequently falling asleep at his work during the day. In his daily walks he had noticed troops of vagrant children in the streets, fast ripening into vice and crime. He took them home to his humble lodgings, and, having clad them with the aid of alms which he collected, he apprenticed them to useful trades. This noble work was observed and admired by others, who freely lent their aid, and in due time a society was formed, which was further developed in 1784. Although Giovanni was himself entirely uneducated, he perceived the advantages of instruction, and caused the children to be taught reading, writing, and arithmetic by one Francesco Cervetti, who afterward left him and founded another refuge for orphans called the "Assumption of the Virgin," which was consolidated with that of Giovanni in 1812. Pius VI. purchased for the institution the Palazzo Ruggi, and became the society's principal protector. Subsequently the charity was removed to different convents, and finally to the church of St. Anne of the Carpenters.

Borgia, Cesare, chā-zā're bōr'jā, Italian ecclesiastic and soldier: b. 1476; d. 12 March 1507. He was the natural son of Rodrigo Borgia, and a Roman lady named Vanozza. His father, who in 1492 became Pope, with the title of Alexander VI., made him a cardinal. When Charles VIII. of France made his entry into Rome, Alexander was obliged to treat with him, and delivered Cesare Borgia into his hands as a hostage, though he escaped a few days after from the camp of the king. In 1497 Alexander bestowed the duchy of Benevento, together with the counties of Terracina and Pontecorvo, on his eldest son, Giovanni, who had already received from the king of Spain the duchy of Gandia. Giovanni died shortly after his investiture, and Cesare has been accused of murdering his brother out of jealousy, but historical proof of this charge is utterly lacking. His father permitted him to abandon his ecclesiastical office and devote himself to the profession of arms, and sent him to France to carry to Louis XII. the bull for divorce and dispensation for marriage which he had long desired to obtain. Louis rewarded Borgia with the duchy of Valentinois, a body-guard of 100 men, and 20,000 livres a year, and promised to aid him in his projects of conquest. In 1499 Cesare married a daughter of King John of Navarre, and accompanied Louis XII. to Italy. He first undertook the conquest of Romagna, expelled the lawful possessors of the land, caused them to be treacherously murdered, and himself, in 1501, to be appointed by his father Duke of Romagna. In the same year he wrested the

principality of Piombino from Jacopo d'Apiano. He also endeavored, though in vain, to make himself Duke of Bologna and Florence. In 1502 he announced that he was about to attack Camerino, and demanded for that purpose soldiers and artillery from Guidobaldo of Montefeltro, Duke of Urbino. Camerino was taken by storm, and Giulio di Barona, the lord of the city, with both his sons, was strangled at the command of Borgia. Meanwhile all the petty princes had united and collected soldiery for their defense; but Cesare Borgia terrified some by means of 3,000 Swiss whom he called to Italy, and gained over others by advantageous offers. Thus he dissolved their alliance, seized their lands, and saw no further obstacle to his being made, by his father, king of Romagna, of the March, and of Umbria, when Alexander VI. died, 17 Aug. 1503. At the same time Cesare Borgia was attacked by a severe disease at a moment when his whole activity and presence of mind were needed. He found means, indeed, to get the treasures of his father into his possession, assembled his troops in Rome, and formed a closer alliance with France; but enemies rose against him on all sides, one of the most bitter of whom was the new Pope, Julius II. Borgia was arrested and carried to Spain, where he remained for two years in prison. He at length made his escape to his brother-in-law, the king of Navarre, went with him to war against Castile, and was killed by a shot before the castle of Viana.

Borgia, Francisco, frän-thēs'kō, or **St. Francis** (DUKE of GANDIA), Spanish ecclesiastic: b. Janda, Spain, 1510; d. Rome, October 1572. He was eminent as a soldier and statesman, and enjoyed the confidence and friendship of Charles V., who appointed him viceroy of Catalonia. While very young he married a noble Portuguese lady, Eleonora de Castro, by whom he had a large family. He was always very strict in his morality, and exact in his religious duties. After the death of his wife he entered the Society of Jesus, and was ordained priest in the 40th year of his age. At the death of Laynez, in 1565, he was elected General of the society, and remained in office until his death. Several bishoprics, and the dignity of cardinal, were repeatedly pressed upon him, but he refused them all. He was canonized by Clement X. in 1671.

Borgia, Lucrezia, loo-krād'zē-ā, daughter of Pope Alexander VI., and sister of Cesare Borgia (q.v.): b. 1480; d. Ferrara, 24 June 1519. When a mere child she was betrothed to a gentleman of Aragon, but her father, on attaining the popedom, thought the match beneath her, and broke the engagement, marrying her to Giovanni Sforza, lord of Pesaro. After she had lived with him for four years, Alexander dissolved the marriage on the ground of the husband's impotency, and gave her to Alphonso, Duke of Bisceglia, natural son of Alphonso II. of Aragon. Two years after her husband was assassinated in a quarrel with Cesare Borgia. Within the course of a year she married Alphonso d'Este, son of Ercole, Duke of Ferrara. Here she became a liberal patroness of poets, who endeavored to repay her benefactions by lauding her as the pattern of every virtue. The character of Lucrezia Borgia has been the subject of much controversy, but recent historical

researches have placed her in a much fairer light and it has been shown beyond dispute, that after her marriage to Alphonso d'Este her life was a model of virtue and beneficence.

Borgia, Rodrigo. See ALEXANDER VI.

Borgia, Stefano, stē-fā'nō, Italian ecclesiastic: b. Velletri, 3 Dec. 1731; d. Lyon, 23 Nov. 1804. He was brought up by his uncle, Alexander Borgia, Archbishop of Fermo, and in 1750, on becoming a member of the Etruscan Academy of Cortona, commenced at Velletri to form a museum which has since become one of the richest private collections in existence. In 1759 he was appointed by Benedict XIV. governor of Benevento, and in 1770 he became secretary to the College of Propaganda, which brought him into immediate relation with missionaries to all parts of the world, and enabled him, at comparatively little expense, to enrich his museum with manuscripts, coins, statues, idols, and all the other rarities which each country possessed. In 1789 Pius VI. made him a cardinal, and at the same time appointed him inspector-general of the founding hospital, into which he introduced extensive reforms. In 1797 the revolutionary spirit which had broken out in France extended itself to Rome, and the Pope, as the best means of counteracting it, gave all his confidence to Borgia and installed him as dictator. The situation was extremely difficult, but he showed himself worthy of the trust, and gained such ascendancy over the public mind that tranquillity and good order remained uninterrupted till 1798. By this time the French were at the gates, and the popular party, becoming dominant, established a republic. The Pope was compelled to depart, and Cardinal Borgia, at first arrested, was ordered, on obtaining his liberty, to quit the papal states. After disembarking at Leghorn he repaired to Venice and Padua, and continued regularly to discharge his functions in connection with the Propaganda as if nothing had occurred to interrupt them. He returned to Rome with the new Pope, Pius VII., who treated him with the same confidence as his predecessor. Afterward, when Pius VII. was carried off to France, Borgia was ordered to accompany him, and he accordingly set out, but had only reached Lyons when he was seized with a serious illness, and died. He was the author of several antiquarian and historical works, and deserves honorable mention for his liberal patronage of arts and artists.

Borgne, bôr-nè, Lake, Louisiana, a body of water situated in the southeastern part of the State. Though termed a lake, it is strictly the termination of that large arm of the Mexican Gulf known as Pascagoula Sound, being united to that by a pass or strait crossed by a line of small islands and faced on the east by Grand Island. Lake Borgne is also connected with Lake Pontchartrain by the Rigolet Pass. It is about the average depth of Lake Pontchartrain, and approaches within 15 miles of New Orleans. Its greatest extent is in a northeast and southwest direction, in which its length is about 30 miles. Lake Borgne forms a part of the western boundary of the Mississippi Delta.

Borgognone, Jacopo Cortesi, yā-kō-pō kôr-tā-zē bôr-gō-nyō-nè, French painter: b. St. Hippolite, Burgundy, 1621; d. 1676. He

studied painting under his father, but enlisted in the army and remained in it for three years. On his return he resumed his art, and went to Bologna where he attracted the notice of Guido and became an inmate in his house, where he made good use of the valuable opportunities of improvement thus afforded him. After realizing an independence he visited his native place. Returning again to Italy, where he painted with much success, he resolved to become a Jesuit. He was accordingly admitted into the order at Rome in 1655, but he appears to have painted as diligently as ever. He is remarkable for freedom of design, and the vividness with which his pictures bring the subjects which they represent before the mind.

Borgu, bôr-goo', Africa, a district in the Western Sudan, lying about lat. 10° N., and stretching from the meridian of Greenwich east to the Niger. It is hilly in parts, but much of it is well watered and extremely fertile. Among its numerous productions are rice, grain, indigo, cotton, bananas, and citrons. The inhabitants are Mohammedan. Kiama and Wawa are chief towns.

Bo'ric Acid. See BORACIC ACID.

Boring, a species of circular cutting in which a cylindrical portion of a substance is gradually removed. When tubes of metal are to be formed, a cast is, in some cases, made in solid metal, and the whole of the bore is produced by the boring-machine: in others the cast is made hollow at first, and the borer is only used to give uniformity and finish to the inside of the tube. In boring cannon sometimes the tool is made to revolve while the cannon is at rest, and sometimes the cannon is made to revolve while the tool is at rest. By the latter arrangement the bore is said to be formed with more accuracy than by the other method of putting the borer in motion.

In the jewelry and small metal industries, hand drills, which consist of a spindle with steel bits, to which reciprocating rotation is given, are the implements for piercing small holes. The boring of holes in metal plates is effected by means of drills driven by machinery. The drill is inserted in the end of a vertical spindle, which revolves in a fixed frame and is driven by the bevel wheels. The metal to be bored is placed on a table or other support, below the drill; and the up and down motion, or end pressure and off action, of the drill is effected by the hand gear turning the screw; which, being coupled to the top of the spindle, presses it down or raises it, according to the way it is turned. The spindle slides vertically in the collar forming the axis of the bevel wheel, but is carried round with it by means of a pin which projects into a groove.

As applied to the earth and to rocks, boring embraces two classes of operations — boring of shot-holes for blasting, and the sinking of bores in prospecting for minerals and in forming wells for water, brine, and mineral oils. Blast-holes in rocks are made from one to two — sometimes more — inches in diameter, and may pierce to the depth of nine feet. Such holes are most simply made in hard rock by a steel-pointed drill, struck by a hammer, and turned partly round after each blow to make the hole cylindrical. The addition of a little water serves to preserve the temper of the boring tool, and

makes the rock more easy to cut. In soft rock, whenever the hole is to be vertical, a jumper is used. This is a weighted drill, which acts merely by its own weight when let fall from about a foot in height. The powdered stone is removed at intervals by a scraper. But in all great engineering undertakings rock-boring machinery now supplants hand work. The machines are principally devised to imitate the percussive action of the hand drill, the boring chisel being worked and rotated by compressed air, and sometimes directly by steam. The compressed-air machines possess the great advantage of aiding in the ventilation of the working — often a most important consideration, seeing the operations are chiefly carried on in confined spaces where large volumes of poisonous gases are evolved from explosions. The earliest practical rock-boring machine was that of Sommeiller, one of the engineers of the Mont Cenis tunnel, at which undertaking the apparatus was first used. Now the forms of percussion machines are very numerous, improvements being directed toward lightness and simplicity of parts, and to the method — automatic or otherwise — of advancing the boring-tool as the work proceeds. Among the best known machines are the Barrow, Burleigh, Darlington, Ferroux, Ingersoll, and McKean rock-borers. Diamond drills working in the manner described below are also used. Brandt's rotatory borer is an apparatus similar in action to the diamond drill, but with a crown of hardened steel in place of cutting diamonds. The tool is pressed against, and rotated by water power. An apparatus similar in principle to the brace and bits of the carpenter is used with advantage in uniform rock, such as slate.

The bores for deep wells of all kinds, and for discovering the mineral contents of a region, come under one category. As a preliminary operation in mining, boring is of the utmost importance for discovering the position, thickness, and dip of mineral strata or lodes, and for ascertaining the nature of the overlying deposits. Bores are made by three classes of implement — (1) boring-rods, (2) rope borers, and (3) diamond drills.

The rod-boring instrument consists of an iron shank having a cross-bar at the top and a hollow screw at the bottom; to this all the successive boring instruments are fastened. A simple chisel is first attached to the screw, and one or two men press upon the cross-bar, and, at the same time, force it round like an auger; while another workman, by means of a lever erected overhead, with a chain descending from it to the cross-bar, gives an up-and-down motion to the instrument. When the chisel becomes clogged, from the accumulation of material which it has loosened, it is exchanged for a cylindrical auger, provided with a valve, which scoops out the separate material; and thus by alternate chopping and scooping the work is carried on. The nature of the strata is determined with considerable facility and certainty by examining the fragments brought up by the auger. As the work advances, successive lengths of rod are screwed on at the upper end. A derrick pole is erected over the bore hole for the purpose of elevating the rods, to permit the change of the tools.

The rope method of boring has been long in use among the Chinese. By it the great loss of time arising from the screwing and unscrewing

of the rods at each elevation of the chisel or auger is saved. The chisel and scooping instrument are fastened to a rope, which is alternately elevated and allowed to descend by the simple force of gravity; the instrument thus forces its way through the ground. In the softer rocks of the newer formations this method has been successfully employed in boring for artesian wells. The rope-boring machinery of Mather and Platt, of Salford, England, in which a flat hempen rope is employed, is in extensive use.

For deep well-sinking, as in the Pennsylvania oil region, where depths of 2,000 feet and more have to be reached, and for mineral prospecting, the diamond drill has of late years largely superseded all other borers. With this apparatus the earth can be pierced at any angle, which is a great advantage in investigating mineral deposits; and, moreover, the drill produces solid and continuous cores of the strata through which it passes, so that a complete section of any bore can be exposed to view. The diamond drill consists of a crown, or cylinder of steel, around one edge of which are fixed a series of black diamonds. These diamonds are so set that they project alternately a little beyond the outside and inside edge of the cylinder. This crown is screwed to lengths of iron tubing as it cuts its way by rotation into the rock, and it makes, as it descends, an annular cutting somewhat larger than the thickness of the continuous tube, which the crown and its shaft form. Thus a core of rock is cut out and held within the tube, and the pieces may be lifted out from time to time as the work proceeds. The detritus resulting from the abrasion of the ring of rock is continuously washed away by a current of water, forced down within the tubing. Diamond drills are made of many sizes, from 1¼ up to 18 inches in diameter. The prototype of the diamond drill was M. Fauvelle's hollow boring-rod with steel crown, described at the British Association meeting in 1846.

Borissoglebsk, bō-rē'sō-glēpsk, Russia, a town in the government of Tambof, 120 miles south of the town of that name, and capital of the government. From its situation and water communications it is the centre of a very large trade. It is the seat of an annual fair, and has woolen and iron manufactures. Pop. about 25,000.

Borissov, bō-rē'sof, Russia, a town in the government of Minsk, 50 miles northeast of the town of that name, on the left bank of the Berezina. Not far from it took place the disastrous passage of the Berezina by the French in 1812. Pop. about 15,000.

Börjeson, Johan Helenus Laurentius, yō-hān ēl-ā'nūs lō-rēn'shē-ūs bē'r'yē-sōn, Swedish sculptor: b. Halland, 1835. He studied at Rome and Paris, and in 1879 became professor at the Art Academy of Stockholm. His work includes both portrait-statues and ideal subjects, in which he unites fidelity to nature with love of beauty. Among his works are 'The Bowler'; 'The Fisher Boy of Capri'; 'Youth with a Tortoise'; and the statues of the poet Holberg at Bergen, of the historian Geiger at Upsala, of Axel Oxenstiern at Stockholm, and of King Charles X. Gustavus at Malmö.

Borland, Solon, American senator: b. Virginia: d. Texas, 31 Jan. 1864. He was educated in North Carolina, studied medicine and settled

in Little Rock, Ark. During the Mexican war he served as major in Yell's cavalry, and was taken prisoner in January 1847. After his discharge in June 1847 he served as a volunteer aid to Gen. Worth until the end of the campaign. After serving in the United States Senate (1848-53), he was appointed minister to Central America. When returning to the United States after his resignation he was assaulted at San Juan de Nicaragua for interfering to prevent the arrest of a person charged with murder at Puntas Arenas. For this insult the sloop-of-war Cyane bombarded and destroyed the town, under instructions from the United States government, 13 July 1854. During the Civil War he was a brigadier in the Confederate service, and before his State seceded, raised troops and seized Fort Smith, by order of Gov. Rector, 24 April 1861.

Bor'lase, William, English mineralogist and antiquarian: b. Pendeen, Cornwall, 1696; d. 1772. He studied at Oxford, entered orders, and became successively rector of Ludgvan and vicar of St. Just. The richness of Cornwall in mineral products and antiquities gave a direction to his studies, and he began making collections with the view of afterward giving a description of his native county. In 1750 he was elected a Fellow of the Royal Society, to which he had communicated a valuable paper on the spars and crystals of the Cornish mines, and for many years after he continued to write in its 'Transactions.' In 1754 he published his 'Antiquities of Cornwall,' and in 1758 he completed the work by publishing his 'Natural History of Cornwall.' He kept up a correspondence with the most eminent men of his day, and was on intimate terms with Pope, whom he furnished with materials for his grotto at Twickenham. Dr. Borlase's name, formed out of crystals, is still to be seen there.

Bormann, bōr'mān, Edwin, German poet: b. Leipsic, 14 April 1851. He was educated at the Polytechnic Institute of Dresden, and at Leipsic and Bonn. His first success was won by a series of humorous poems in the Saxon dialect which appeared in the 'Fliegende Blätter.' His other works are in High German; they include 'Seid umschlungen, Millionen,' a book of humorous songs, 'Schelmenlieder'; 'Das Büchlein von der Schwarzen Kunst,' 'Liederhort in Sang und Klang,' and 'Klingsland, Minnelieder und Spielmannsweisen.'

Bormio, bōr'mē-o (Ger. *WORMS*, *voormz*), Italy, a town in Lombardy, near the Adda; pop. about 2,000. In its vicinity are the salt baths called Bagni di Bormio. The temperature is 99° 5'. Gen. Dessolles achieved here a victory over the Austrians, 26 March 1799. The beautiful galleries of the road which leads over the Wormser Joch (an Alpine mountain), from Tyrol to Italy, were destroyed by the Italians in 1848.

Born, Bertrand de, bār-trōn dē bōrn, French troubadour and warrior: b. in the Castle of Born, Périgord, 1140; d. about 1209. He possessed his brother of his estate, whose part was taken by Richard Cœur de Lion in revenge for De Born's satirical lays. Dante places him in the 'Inferno' on account of his verses intensifying the quarrel between Henry II. and his sons.

Börne, Ludwig, lood'vīg ber'ne, German political writer: b. Frankfurt-on-the-Main, of Jewish parents, 6 May 1786; d. Paris, 12 Feb. 1837. He founded, and for three years conducted, *Die Wage*, a journal devoted to civics, science, and art. Of his numerous satirical sketches, all full of humor and wit, these are perhaps the most brilliant: 'Monograph on the German Postal Snail,' 'The Art of Becoming an Original Author in Three Days,' 'Memorial Address to Jean Paul.' Fierce animosity toward the dynastic policies of Germany permeated whatever he wrote; even his literary and dramatic criticism was biased by this passion. His last completed work, 'Menzel, the French Devourer' ('Franzosenfresser'), is proof that to the last his voice was still for war. His 'Complete Works,' in 12 volumes, were published in 1863.

Bor'neëne. See BORNEOL.

Borneil, Giraud de, zhê-rô dè bôr-nâ-ē, a Provençal troubadour of the 12th century: a native of Exideuil, Dordogne. His contemporaries bestowed on him the sobriquet "Master of Troubadours." Some 80 of his songs are extant; among them the charming song of the morning, "Alba."

Bornemann, Wilhelm, vil'hēlm bôr'ne-măn, German dialect poet: b. Gardelegen, 1766; d. 1851. He is one of the foremost representatives of modern Low German poetry. His works are 'Low German Poems' (1810), republished in a 10th edition in 1891; 'Pictures of Nature and the Chase' (1829); 'Humorous Hunting Songs.'

Bor'neo (corrupted by the Portuguese from Bruni or Brunei, the name of a state on its northwest coast), one of the islands of the Malay archipelago, and, next to Australia and New Guinea (but not much smaller than the latter), the largest island in the world. On the south it has the Java Sea; on the east the Strait of Macassar and the Sea of Celebes; on the north the Sulu Sea; on the west and northwest the China Sea. Its circumference is about 3,000 miles, its greatest length, 780 miles, and its greatest breadth 600 miles; area, according to recent calculation, 283,358 square miles. Its outline is but slightly indented by bays and inlets; and yet the skeleton of its mountain ranges, now well ascertained by the travels of Dalton, Low, Burns, and Schwaner, show that at not a very remote period it must have presented the same singular configuration with Celebes and Gilolo—that of a group of peninsulas. Starting from the central mountains, the Anga-anga group, and proceeding northeast, we trace a chain, terminating in Kinibaloo (11,000 feet high, the highest peak in Borneo), which forms the backbone of the peninsula. Hardly half of the island is good terra firma, habitable for man. An alluvial marshy band, varying from 30 to 50 miles in width, surrounds the island, the only avenues to the interior being its numerous rivers and streams. The mouths of 23 rivers, all navigable on an average 100 miles for vessels drawing not more than 12 feet of water, can be counted along the northwest coast, between Capes Sampanmanjo and Datoo. Berow and Coti rivers on the east, Banjar, Murong, Kahajan, and Mendawei rivers on the south, and the rivers Pontianak and Sambas on the west are large streams with tides flowing

far up, and some of them navigable for 200 miles. Innumerable smaller streams flow from the great water-sheds.

In connection with the river systems there are numerous lakes in Borneo; but of true mountain lakes on a large scale there are probably few. The great lake of Kinabalu, which figured in older accounts, with 100 miles of circumference, is a pure myth, based perhaps on a misunderstood description of the great grass-covered plain of Danao.

Meteorological Conditions, Products, etc.—

The climate in the low grounds is humid, hot, and unhealthful for Europeans; but in the higher parts toward the north the temperature is generally moderate, the thermometer at noon varying from 81° to 91° F. During the rainy season, from November to May, heavy storms of wind with loud thunder are experienced on the west coast. The influence of the land and sea breezes passes inland to quite remarkable distances across the level plains and up the river valleys. Vegetation is extremely luxuriant. The forests produce ironwood, bilian, teak, ebony, sandalwood, gutta-percha, dyewoods, benzoin, wax, dragon's-blood, sago, various resins, vegetable oils, and gums. The camphor of Brunei is the best in Asia. The mohor-tree, well adapted for making native boats, attains a height of 80 feet, and the kaladang, suited for large masts, of 200 feet. Nutmegs, cloves, cinnamon, pepper, betel, ginger, rice, millet, sweet potatoes, yams, cotton in Amuntai, sugar-cane in Sambas and Montrado, indigo, tobacco, coffee in Sambas, pineapples, coconuts, etc., are cultivated. The mountains and forests contain many monkeys, among which is the orang-outang. Tapirs, a small kind of tiger, small Malay bears, swine, wild oxen or banteng, and various kinds of deer abound. The elephant is found only in the north and the rhinoceros in the northwest. The few domesticated animals are buffaloes, sheep, goats, dogs, and cats. A few horses are seen in Banjermassin. Among the birds are eagles, vultures, argus pheasants, peacocks, flamingoes, pigeons, parrots, and also the swifts (*Collocalia esculenta*) which construct the edible nests prized by the Chinese for making soup. The rivers, lakes, and lagoons swarm with crocodiles, and many kinds of snakes, frogs, lizards, and leeches. Fish is plentiful, and the coasts are rich in tortoises, pearl mussels, oysters, and trepang. Brilliant butterflies and moths are in great variety. Among the mineral products are coal, gold, and copper, especially in Montrado; antimony, iron, tin, platinum, nickel, diamonds and other precious stones, rock crystals, porcelain clay, petroleum, and sulphur. The diamond mines are chiefly in Landak and Pontianak; Sambas produces the greatest quantity of gold; the kingdom of Brunei, Kutei, and Banjermassin, the largest amount of coal. The Pengaron coal field, worked by the Dutch government, is one of the most important.

Population.—The population consists of three classes, the Dyaks or Dayaks, who are the aboriginal heathen inhabitants and constitute the great bulk of the population; the Mohammedans or Malays—for this name is extended so as to include all professors of Islam, whether true Malays, Buginese, Javanese, Dyaks, or Arabs; and the Chinese. The Dyaks live chiefly in the interior, and employ themselves

BORNEOL

with tillage and the collecting of gutta-percha, resin, gums, rattans, gold dust, and wax. They are divided into numerous tribes. The Malays (taking the name ethnographically) dwell on the coasts, are traders and bold sailors. They are more civilized than the Dyaks, cultivate the grounds around their houses, lay out gardens, keep cattle, and live partly by fishing. The Chinese, chiefly from Canton, have penetrated far into the interior. They engage in trade and mining, are unwearied in their efforts to make money, and then return to their native country. They have always endeavored to live as independent republics (*kong-si*) under chiefs chosen by themselves, and according to Chinese laws. In 1857 the Chinese living in Sarawak rebelled, and were nearly exterminated. The Dutch were also compelled to put them down by force of arms, and have imposed a poll tax. The women of Borneo, except the Dyak, weave cotton fabrics, make earthenware, baskets, and mats of beautiful designs and colors. In the district of Banjarmassin are factories of weapons. The principal exports are gold, gold dust, diamonds, coal, rattans, gutta-percha, edible nests, cotton, wax, timber, dye-woods, mats, resins, sandalwood, camphor, etc.; the imports, earthenware, iron, steel, and copper work, piece-goods, yarns, woolen and silk fabrics, medicines, provisions, wines, spirits, rice, sugar, tea, tobacco, opium, trepang, gambir, gunpowder, etc.

Divisions.—Borneo has never formed a political unity, and there is no native designation for the island as a whole. The name Borneo (Burnei or Brunei) in fact properly applies only to the Malay kingdom on the northwest coast; and Kalamantan or Kalamantin, sometimes quoted as a general appellation, is also of limited purport. Borneo originally included nearly the whole of the northwest of the island. The sultan has absolute authority. In 1847 he undertook not to surrender any of his territory to any other power without the sanction of the British government. The capital, Brunei, 20 miles from the coast, on the river of the same name, has at the most 20,000 inhabitants; whereas it was credited by Pigafetta (16th century) with 25,000 houses. The total population of the country within its present limits may be stated at 125,000. Its area was reduced by the erection of Sarawak into a practically independent principality by Sir James Brooke (1841-68), and by the establishment of the British North Borneo Company as a recognized governing body. The company's charter, granted in 1881, transferred to them rights originally obtained by an American in 1865. This territory consists partly of a portion of the old kingdom of Brunei, partly also of districts on the east coast, claimed by the sultan of the Sulu Islands. Against the British occupation of the Sulu territory a protest was made by Spain, which had for some time been gradually incorporating the sultan's possessions. As a matter of fact the British North Borneo Company has been successful in appropriating and developing its territory, which, with an area of 30,709 square miles, and a coast line of 900 miles, is now divided into the East Coast Residency and the provinces of Dent, Keppel, and Alcock, and has its capital at Elopura or Sandakan, the largest settlement, with 5,000 inhabitants. The population of the territory is estimated at 200,000. By far the largest part of the island is ruled directly

or indirectly by the Dutch, who have divided it into the residency of the western division of Borneo, and that of the southern and eastern, the former having Pontianak as the seat of government, the latter Banjarmassin. Besides a number of smaller dependencies, the western division contains the kingdom of Landak, Tayan, Mampawa, Sukadana, Simpang, Matan, Sekadow, Sintang, Sambas. Among the separate states which go to form the southern and eastern divisions are Kotaringin, Banjarmassin, and Martapura. In consequence of a decree of the Sultan of Banjarmassin, the district watered by the Great Dyak or Kahayan is preserved for the native tribes, who in 1879 were estimated at 18,000 souls; Chinese, Malays, etc., are forbidden to ascend the river higher than the Kanpore Pilany. The same is the case with the basins of the Kapuas, Murug, known as the Little Dyak district. The population of the whole of the Dutch portion of the island on 31 Dec. 1881, was 959,491, of whom 799 were Europeans, 31,550 Chinese, 924,731 natives, 2,070 Arabs, and 341 miscellaneous Orientals. In the number of natives are included from 200,000 to 300,000 Malays settled along the coast, who used, formerly, to be counted among the strangers. The island of Labuan, off the coast of Brunei, has belonged to the British since 1846.

The Chinese had commercial dealings with Borneo as early as the 5th century, but they made no settlement for a long time after. The Malay kingdom of Borneo proper dates back to the 13th century. Another Malay settlement of later origin, Sambas, was at first dependent on Johore in the Malay peninsula. Sukadana was founded by Hindu Javanese from the kingdom of Majapahit (see JAVA) and spread its influence on the whole southern part of the west coast. Mampawa was a Buginese settlement, and Pontianak was founded as late as 1771 by a colony of Arabs, Malays, and Buginese. Islam began to be preached by Arabs from Palembang in the 16th century.

The Portuguese effected a settlement in 1690 at Banjarmassin; from thence they were, however, soon expelled. The Dutch succeeded in concluding a treaty of commerce with the princes of Banjarmassin. They erected a fort and factory in 1643, and a second in 1778 at Pontianak. The British made unsuccessful attempts in 1702 and 1774 to effect a settlement in Borneo, but, during the 19th century they acquired a preponderating influence on the northwest coast.

Borneol, or **Borneo Camphor**, a crystalline organic compound, often used as a substitute for common or laurel camphor. Borneol is obtained from a tree indigenous to Sumatra, Borneo, and Labuan, being deposited in crystals in cracks in the wood. To obtain it the tree is cut down, and the longitudinal fissures are opened, and the camphor removed. Large trees often yield only from 3 to 11 pounds; and owing to the reckless manner in which the trees have been destroyed without the planting of others, the Sumatran forests now contain few that are worth working. Borneol has the chemical formula $C_{10}H_{17}.OH$, and it may be prepared from common camphor by the action of reducing agents. It is not so volatile as common camphor, and is also harder. It is but slightly soluble in water, although it dissolves freely in alcohol and ether. When distilled with phos-

phorous pentoxide, borneol is converted into one or more terpenes, prominent among which is borneo-camphene or borneene ($C_{10}H_{16}$). Pure borneol sinks in water, while common camphor floats.

Bornholm, a Danish island in the Baltic Sea, nearly surrounded with rocks; situated in lat. $55^{\circ} 10' N.$; lon. $15^{\circ} E.$; about 24 miles long, and 16 broad; pop. 35,364. It is stony but fertile; yields oats and butter; has excellent pastures; and also mines of coal, marble quarries, and fisheries. The island has long been famous for its rock-crystals.

Bornier, Henri, òn-rē bôr-nê-â (VICOMTE DE, vê-kônt dè), French dramatist: b. Lunel, 25 Dec. 1825. His plays are notable for splendor of diction. Among them are 'Luther's Wedding' (1845); 'Dante and Beatrice'; 'The Daughter of Roland.' He twice won the prize of the Academy, with the lyrics, 'The Isthmus of Suez' (1861); and 'France in the Extreme East' (1863). He is the author of several successful novels and romances, and is a member of the Academy.

Bornite, a native sulphide of copper and iron, containing these metals in various proportions. The mineral crystallizes in the isometric system, and its crystals have the formula $3Cu_2S.Fe_2S_3$. It is reddish brown in color when freshly broken, but speedily takes an iridescent tarnish. Its hardness is 3, and its specific gravity from 4.9 to 5.4. The massive varieties contain from 50 to 70 per cent of copper, and the mineral constitutes a valuable ore of that metal. Bornite occurs abundantly in a copper-mine at Bristol, Conn. Bornite occurs in many western copper mines, as at Butte, Mont., and in Colorado, being at times highly argentiferous. It abounds in Chile, Peru, Mexico, Canada and many other countries.

Bornou, a kingdom of Central Africa, lying between lat. 10° and $15^{\circ} N.$, and lon. 12° and $16^{\circ} 30' E.$; bounded north by Kanem and the desert, east by Lake Chad, south by Mandara, and west by Sudan. From March to July the heat is extreme, the thermometer rising to 107° and rarely falling below $86^{\circ} F.$; during this time scorching winds from the south prevail. As in other tropical countries the seasons are divided into the dry and rainy: the latter continues from March to October, when the air becomes milder and fresher. The country is populous, containing 13 principal towns. These are generally large and well built, with walls 40 feet high, and about 20 feet thick. The houses consist of several courtyards, with apartments for slaves, habitations for the different wives, and several turrets connected by terraces, forming the apartments of the owner. The Bornou people, or Kanuri, have negro features; they are peaceable and industrious, practising agriculture and various mechanical arts. The government is an absolute monarchy, with certain constitutional forms, and the sultan or mai can, it is said, muster a well-equipped army of 25,000 or 30,000 men, partly cavalry, armed with musket, rifle, sabre, etc. Indian corn, cotton, and indigo are the most valuable productions of the soil. Fruits and vegetables are also raised. The domestic animals are asses, camels, horses, dogs, sheep, goats, and oxen. Lions, leopards, hyenas, jackals, elephants, and buffaloes roam

the forests. The crocodile and hippopotamus are considered a luxury. The ostrich, pelican, crane, and guinea-fowl abound. Locusts often appear in great clouds, and are eaten by the natives. The capital is Kuka, near the shore of Lake Chad. Bornou belongs to the British sphere of influence. Estimated pop. 5,000,000.

Boro Budor, bō-rō boo-dōr (the 'Great Buddha'), the ruin of a temple in Java, near the junction of the Ello and Progo, the most elaborate monument of the Buddhist style of architecture anywhere existing. Javanese chronicles ascribe the building of the temple to the beginning of the 7th century; there are no inscriptions, but it was probably finished between 1400 and 1430. Boro Budor is built on a low hill between four vast volcanoes which supplied the blocks of trachyte of which the edifice is built; its height to the cupola is 118 feet. It is a pyramid of a square form, each side at the base measuring 520 feet, and consists of seven walls, which are built like the steps of a stair, up a hill. Between the walls are narrow terraces running round the building; in each is an arched doorway leading to the next higher terrace. These walls are richly ornamented with statuary. Outside are over 400 niches topped with fantastic domes, and each occupied by a large statue of Buddha. Between each of these are bas-reliefs, including figures of the god seated, and architectural ornaments and carvings of all sorts. Below the niches, on the lower story, is an immense bas-relief running round the whole building, representing scenes from the life of Buddha, and religious subjects. The inner faces of the building are also profusely ornamented with bas-reliefs, representing battles, sea-fights, processions, and chariot races, carried to an extent unrivaled by any other building in the world. Of the large reliefs alone there are over 2,000; and most of them are as vigorously designed as they are carefully executed. Within the upper square terrace are three circular ones, the outer ornamented with 32, the next with 24, and the upper with 16 small bell-shaped shrines (*dagops*), each containing a seated statue of Buddha, which can be seen through the open works of their roofs. The whole is surmounted by a cupola, the principal and probably the most ancient part of the structure. It is now empty, a sunken chamber, 10 feet deep, representing what was, no doubt, a *dagop* intended to contain the precious relic for which this splendid temple was erected. The niches containing the cross-legged figures have been supposed to be a copy, in durable architecture, of the cells of a Buddhist monastery, each occupied by a shaven priest; the cupola is rather to be classified with the topes or stupas of Afghanistan. The structure is thus a compound of a tope with a copy, in durable architecture, of the frail cells of a vihara.

Borodin, bō-rō'dēn, Alexander Porfirievich, pōr-fēr-yā'vich, Russian composer: b. St. Petersburg, 12 Nov. 1834; d. there, 27 Feb. 1887. He studied medicine and chemistry, and was made professor of chemistry at the Medico-Surgical Academy of St. Petersburg. He was at the same time an excellent musician, one of the chief representatives of the new Russian school. His chief works are two symphonies and 'In Central Asia.' His opera, 'Prince Igor,' which he had not completed at his death

was finished by Rimsky-Korsakoff and Glazounoff, and was brought out in St. Petersburg in November 1890.

Borodino, bō-rō-dē'nō, Russia, a village 70 miles west of Moscow; on the Kaluga, an affluent of the Moskwa. It gave name to the great battle fought between the French army under Napoleon and the Russians under Kutusoff, 7 Sept. 1812. The battle of Borodino was one of the most obstinately disputed in history, and the loss on both sides was almost equally great. Out of 257,000 men engaged, between 70,000 and 80,000 were killed and wounded. The Russians retreated on the following day, but in the most perfect order, and therefore claim this battle as a victory; but the French, who name the battle from the Moskwa, have always maintained a similar claim.

Boroglyceride, -glis'- (from "boron" and "glycerine"), an antiseptic substance, soluble in alcohol and in 40 parts of water, and containing about 25 per cent of borate of glycerine ($C_3H_5BO_3$), the remaining 75 per cent consisting of free boracic acid and glycerine in equivalent proportions. Boroglyceride is considered harmless, and is much used in the preservation of fruits and wines, and other articles of food.

Bo'ron (from "borax"), one of the non-metallic elements. In nature it is never found in the uncombined or elementary state, though it occurs abundantly in combination with other elements, especially in regions that are or have been volcanic. The principal compounds of it that are found in nature are borax and boracic acid (qq.v.). It is a constituent of numerous other minerals, but most of these have but little commercial importance. Boron was first obtained in the elementary state about the year 1808, by Gay-Lussac and Thénard in France, and by Sir Humphry Davy in England. Gay-Lussac and Thénard prepared the element by heating boracic acid very strongly until all its water was expelled, and then heating the resulting substance (now known as boric oxid) with metallic potassium. The potassium removed the oxygen from the boric oxid, setting the element boron free. When thus prepared boron is an opaque amorphous powder of a greenish-brown color. It has neither taste nor odor, but it stains the fingers strongly. Owing to its finely divided condition it is apt to take fire spontaneously; but if it is consolidated by pressure it is not affected by the air at common temperatures, though it burns with a reddish light when heated. It is not affected by water save that water will dissolve a slight amount of it when it is freshly prepared. Strong nitric acid will dissolve it in the cold, and hot sulphuric acid attacks it also. It is one of the few substances that will combine directly with nitrogen, which it does when heated in that gas. The atomic weight of boron has not been determined with satisfactory precision, but Clarke gives 10.97 as the best result obtainable from the existing data. The amorphous boron described above is soluble in melted aluminum, from which it crystallizes out on cooling. The crystals so obtained were formerly thought to consist of pure boron, but it has been shown that they always contain a definite amount of aluminum. These crystals may be obtained of such hardness that they will scratch both corundum and the

ruby, the diamond being the only substance that exceeds them in this respect. The specific gravity of amorphous boron has not been satisfactorily determined, but it appears to exceed 1.84. The specific gravity of the crystals obtained as described above is said by Miller to be 2.68. The specific heat of boron varies considerably with the temperature. At 250° C. it is .37, and at 1,000° C. it is probably 0.5. Boron is a non-conductor of electricity.

Bororós, bō-rō-rōs', a tribe of South American Indians of the Tupi or Guarani stock, variously reported from a few hundred to a few thousand, living in southwestern Brazil around the headwaters of the Parana and Paraguay, the small remnants of a once powerful race, thinned by old Portuguese slave raids and disease. They live in villages and do some planting, but live mainly by hunting with long bows and bone-tipped arrows. They are exceptionally tall, averaging over five feet eight inches, and athletic, and are reported to practice both polygamy and polyandry, but little is really known of them.

Borough, in England, either an incorporated municipality with an organized government and a charter of special privileges (municipal borough), or a district represented by a member of Parliament (parliamentary borough). The *burh* (hill) was originally a hill-fort; then the settlement around it, with its own court, and head officer called a "port-reeve." Under the Norman dynasty the port-reeves were replaced by royal officers, and the boroughs gradually received special charters and were governed by their leading guilds. As their support came to be needed by the governing factions they were given representation in Parliament; and under the Tudors, especially Mary, small boroughs in great profusion were created expressly to return members in the government interest. This was stopped under Elizabeth. Besides these the older boroughs decayed till they had little or no population, but were allowed to keep their parliamentary power to strengthen the aristocratic and land-owning interest, the proprietors of the sites returning whom they chose: these were called "rotten boroughs," and the chief was "Old Sarum" (that is, Old Salisbury), with not a single inhabitant but two members of Parliament. Others had only one. Those somewhat larger, but still so small as to be at the dictation of some one person or family, were called "pocket boroughs." The Reform Bill of 1832 swept away the worst of these anomalies.

In the United States the term is now restricted to certain incorporated villages below the rank of cities in four States — Connecticut, New Jersey, Minnesota, and Pennsylvania; and is practically synonymous with "town" in most other States, and with "village" in Ohio. At the beginning of colonization the natural idea was to transplant the English borough system to America; but the conditions of settlement and government made it generally inapplicable. In Virginia the term was applied in the sense of "parliamentary borough," to districts made up of hundreds and plantations, having representation in the House of Burgesses, of which in 1619 there were 11; but the municipal borough did not take root there. Lord Baltimore and William Penn were empowered to establish the latter in

their colonies of Maryland and Pennsylvania; but the former did not avail himself of it at all, and the latter very little, nor his heirs after him. After the Revolution, however, the Pennsylvania legislature granted special borough charters freely, and in 1834 passed an act empowering courts of quarter sessions to grant them; in 1851 a general act for their creation and regulation was passed. In New Jersey they were created by special charters as early as the beginning of the 18th century, and in 1818 a general act was passed. In Connecticut they have always been created by the legislature, in special acts. In Minnesota and Pennsylvania the boundaries of the borough are coterminous with the township, forming one of the primary county divisions: in Connecticut and New Jersey the borough is only a village government within a town, which in all cases is a separate body including the borough; the latter being only the thickly settled portion within the range generally of the postal, fire, etc., departments, and governed by a warden and burgesses, corresponding to the mayor and single-chamber council of a city.

A still further extension was given to the term by the New York legislature in 1897, when the city of Greater New York was constituted of five "boroughs"—Manhattan, Brooklyn, Queens, The Bronx, and Richmond.

Borough-English, in law, a mode of descent in some ancient boroughs and manors, in which the owner's youngest son, or his youngest brother (if he has no issue), is the heir. It is evidently a custom of Saxon origin, and is so named to distinguish it from the Norman customs. It still holds in a few places.

Borromean (bō-rō-mā'an) **Islands**, four small islands in a bay of Lago Maggiore, north Italy, belonging to the Borromeo family, and named respectively Isola Bella, Isola Madre, Isola dei Pescatori, and L'Isolino. The Isola Madre lies farthest from the shore of the lake. It is laid out in seven terraces, rising one above the other, with charming walks and a mansion on the top. The Isola Bella contains a handsome and extensive palace, with private chapel and picture gallery, the fine gardens adjoining being laid out upon 10 terraces rising above each other. The island was formerly little more than a barren rock and much soil required to be brought from the mainland. The Isola dei Pescatori is mostly occupied by a fishing village. Magnificent views of the surrounding scenery are obtained from these islands.

Borromeo, bō-rō-mā'o, **Carlo** (COUNT), saint and cardinal of the Roman Catholic Church: b. Arona, Italy, 2 Oct. 1538; d. 3 Nov. 1584. He studied law at Pavia; was in 1559 made doctor, and in 1560 was successively appointed by his uncle Pius IV. apostolical prothonotary, referendary, cardinal, and archbishop of Milan. As legate over Romagna, the March of Ancona, and Bologna, he had a great share in the civil government: as protector of Portugal, of the Netherlands, of Switzerland, of the Franciscans, Carmelites, and of the Knights of Malta, he administered several important branches of the spiritual government of the Pope, who created him his grand penitentiary, and did nothing of importance without his advice. The re-opening and the results of the Council of Trent, so advantageous to the papal authority, were chiefly

effected by the great influence of Borromeo. He did much for the embellishment of the papal buildings, employing even his own fortune for that purpose, and established many excellent institutions as archbishop of Milan; improved the discipline of the clergy, founded schools, seminaries, an order of secular priests (oblates), libraries, and hospitals, and was indefatigable in doing good. During the pestilence which raged in Milan in 1576 he distinguished himself by his heroic devotion to his flock. As soon as the scourge appeared in the city he hastened from a distant part of his diocese, where he was making a pastoral visitation, and spent all his energies in giving bodily aid and spiritual consolation to the plague-stricken inhabitants. All his virtues, however, could not save him from persecution and calumny: he was even severely attacked by the government, but no charge could be proved against him. Miracles were said to have been wrought at his tomb immediately after his death, and his canonization took place in 1610.

Borromeo, Federigo, fā-dā-rē'gō (COUNT), cardinal, and archbishop of Milan, nephew of St. Charles: b. Milan, 1564; d. 22 Sept. 1631. He founded the Ambrosian Library at Milan in 1609, and devoted to it most of his fortune. He sent emissaries to several countries to collect manuscripts for it. He added to it a printing establishment, and founded academies, schools, and charitable institutions. When Milan was desolated by a pestilence in 1630, Federigo showed the same heroism as his uncle Carlo had done during that of 1576.

Borromini, Francesco, frān-chēs-kō bōr-rō-mē'nē, Italian architect: b. Bissone, 1599; d. (by his own hand) 1667. He studied sculpture in Milan and architecture in Rome under Maderno, architect of St. Peters. After Maderno's death he was a pupil of Bernini, by whom he was employed on various parts of St. Peters. He built the church of San Ivo alla Sapienza, the Oratory and Cloister of San Filippo Neri, the façade of the church of Santa Agnese in the Piazza Navona, and the interior of San Giovanni in Laterano. He was one of the chief representatives of the baroque style. Borromini conceived an unreasoning hatred for his instructor Bernini and determined to surpass him in his art, but maddened by the latter's success he committed suicide.

Borrow, George, English traveler, linguist, and writer on gypsy life: b. East Dereham, Norfolk, 1803; d. Oulton Broad, Suffolk, August 1881. On his father's side he was descended from a Cornish family, and his mother was of French extraction. His father was a recruiting officer who constantly changed his residence, and thus Borrow's early years were passed in various parts of the United Kingdom. He received part of his education in Edinburgh High School, and in 1820 was articled to a Norwich solicitor. It was about this time that he laid the foundation of his linguistic knowledge under the guidance of William Taylor, a friend of Southey. After his father's death he went to London, where he earned his livelihood by literary hackwork; but, soon tiring of this, he set out on a series of journeys through England, France, Germany, Russia, and other countries, acting latterly as agent of the British and Foreign Bible Society and making gypsy life and

customs a special study. During the seven years or so prior to his engagement by the Bible Society he seems to have suffered great privations, but of his movements at that time he has told us nothing. He married in 1840, and settled on a small estate of his wife's at Oulton Broad, in the northeast of Suffolk, where he died. He maintained to the last his strong sympathy for gypsy life, and not only permitted but encouraged the gypsies to encamp on his estate. His best known work is 'The Bible in Spain' (3 vols. 1843); and his other publications include 'Targum: or, Metrical Translations from Thirty Languages and Dialects' (1835) 'The Zincali: or, an Account of the Gypsies in Spain' (1841); 'Lavengro, the Scholar, the Gypsy, the Priest' (1851), a sort of idealized autobiography; 'The Romany Rye,' a sequel to 'Lavengro' (1857); 'Wild Wales, Its People, Language, and Scenery' (1862); and 'Romano Lavo-Lil' (1874), a dictionary of the gypsy language. Borrow was a strong, manly character, delighting in the free, open-air existence of the gypsies whose life he knew so well, and despising heartily all affectation and false gentility. His later works, by their outspokenness, lost him much of the reputation earned by his 'Bible in Spain.' See the 'Life Writings, and Correspondence' by Dr. Knapp (2 vols. 1899).

Borrowing Days, the last three days of March, Old Style; the popular notion being, in Scotland and some parts of England, that they were borrowed by March from April. The fiction is of great antiquity, and probably arose in the observation of a frequent wintry relapse about the end of March.

Borrowstounness' (popularly pronounced and now often written Bo'NESS), a town in Linlithgowshire, Scotland, distant 17 miles west by north of Edinburgh. It is situated on a low peninsula, washed by the Forth, and possesses three principal streets running from west to east, one of them a continuation of the other two. The chief industrial establishments are potteries, iron-foundries, engineering shops, chemical manure works, saw-mills, timber-yards, coal and coke works, distilleries, brick-fields, etc., and in the vicinity are very extensive collieries. A new dock has recently been constructed and the old harbor improved, hydraulic hoists and other appliances being provided. The wall of Antoninus ran through Borrowstounness, and traces of it are still visible. Pop. (1901) 9,100.

Borsip'pa, a very ancient city of Babylonia, the site of which is marked by the ruins Birs Nimrud.

Bort, a rounded, translucent variety of diamond, harder than the distinctly crystallized gem variety. It is of much value as an abrasive.

Bortnyanski, Dmitri Stepanovitch, dmě'trě stěp-ăn'ô-vich bort-nyăn-ske, Russian composer: b. Glukhov, 1751; d. St. Petersburg, 9 Sept. 1825. He received his education at Moscow and at Venice and other Italian cities, under Galuppi. In 1779 he returned to Russia and was appointed director of the Imperial Chapel, devoting himself to the improvement and training of the choir. His compositions are almost entirely church music, including 35 sacred concertos, a liturgy for three voices, and a collection of psalms. His music, combining the

spirit of both the Slavic and the Italian, is thoroughly original and made an epoch in Russian church music.

Bory de Saint Vincent, Jean Baptiste George Marie, zhôn băp-těst zhôrzh mă-rě bô-rě dè săn văn-sôn, French naturalist: b. 1780; d. 1846. About 1800-2 he visited the Canaries, Mauritius, and other African islands. He afterward served for a time in the army, and conducted scientific expeditions to Greece and to Algiers. Among his chief works are 'Annales des Sciences Physiques' (8 vols. 1819-21); 'Voyage dans les Quatre Principales Iles des Mers d'Afrique' (3 vols. 1804); 'Expédition Scientifique de Morée' (3 vols. 1832); 'L'Homme, Essai Zoologique sur le Genre Humain' (2 vols. 1836).

Borysthenes, bô-ris'thên-ês, the ancient name of the Dnieper.

Borz'oi, or **Russian Wolfhound**, a hunting-dog of northern Europe, substantially the same as the ancient long-haired greyhound of the Arabs and Persians, whose coat has been lengthened in adaptation to a cold climate. It is a lithe, active dog, standing 28 inches high at the shoulders, and upward, and weighing from 75 to 100 pounds. Its hair is silky and loose, especially so on the tail, which, contrary to the other greyhound characteristics, is "feathered" longer than is the setter's, which it very much resembles. It has large padded feet. In color the borzois are combinations of black, white, and tan. These dogs are popular, especially as stately attendants upon ladies, and good specimens may be seen at all the principal kennel shows of the country.

Bos, Lambert, Dutch philologist: b. Workum, Friesland, 23 Nov. 1670; d. 6 Jan. 1717. He was instructed by his father in Greek and Latin. Vitrina, the distinguished Oriental scholar, was professor at Franeker, and thither young Bos went to pursue his philological studies. Not long after he was chosen Greek professor in that university. He is best known by his work entitled 'Ellipses Græcæ' (1702), though he was the author of several others, among which may be mentioned an edition of the Septuagint and 'Animadversiones ad Scriptores Græcos.'

Bosa, a seaport on the west coast of Sardinia, province of Cagliari, built partly on the side of a hill crowned by an old castle, and partly in an unhealthy plain. It has a cathedral and other churches, a theological seminary, and is the residence of a bishop, suffragan to the archbishop of Sassari. It is in a wine and oil producing region and carries on coral fishing and tanning. Pop. (1901) 6,846.

Bosanquet, bo-săn-ka, **Bernard**, English philosopher: b. 1848. He was lecturer at University College, Oxford, 1871-81, and from 1881 to 1897 was much engaged in university extension lecturing and charity organization. He has written 'Logic, or Morphology of Knowledge'; 'History of Æsthetic'; 'Knowledge and Reality'; 'Essays and Addresses'; 'Civilization of Christendom'; 'Essentials of Logic'; 'Aspects of the Social Problem'; 'Psychology of Moral Self'; 'Companion to Plato's Republic, for English Readers'; 'Education of the Young in Plato's Republic'; 'Philosophical Theory of the State.'

Bosc, Louis Augustin Guillaume, French naturalist: b. Paris, 29 Jan. 1759; d. there, 10 July 1828. Employed in various public offices until 1793, his political sympathies made him obnoxious to the terrorists, and concealing himself in the forest of Montmorency, he resumed there, under the greatest difficulties, his favorite science of botany, having already previously gained some distinction as a naturalist. On returning to Paris after the fall of Robespierre he was sent in 1796 as French consul to the United States; but, not recognized in this position by the American authorities, he explored the country for scientific purposes. In 1799 he was appointed chief of the administration of prisons, but lost this office on the 18th Brumaire. Applying himself thenceforward to literary labors, he made numerous contributions to natural science. His *'Histoire Naturelle des Coquilles'* (5 vols. 2d ed. Paris 1824) and *'Histoire des Vers et des Crustacées'* (2 vols. 2d ed. Paris 1829), and his studies on the vines of France, are his principal achievements. He was made a member of the Academy of Sciences, of the Central Agricultural Society, and finally, after having been inspector of the gardens at Versailles, he became professor at the Jardin des Plantes at Paris. Roland, under whose administration he had served, and who perished with his wife on the guillotine, made him guardian of their daughter. Bosc published memoirs of the celebrated Madame Roland, and succeeded in obtaining for Mlle. Roland the confiscated property of her unfortunate parents.

Boscan Almogaver, Juan, Spanish poet: b. Barcelona, about 1493; d. near Perpignan, April 1542. His parents, who belonged to the most ancient nobility, gave him a careful education. He followed the court of Charles V. and in 1526 was attached to it for some time in Granada. His noble manners and character gained him the favor of the emperor, and the education of the Duke of Alva was committed to him. After his marriage Boscan lived at Barcelona, occupied in publishing his works, together with those of his deceased friend Garcilaso, in which task he was employed at the time of his death. Boscan first introduced Italian measures into Spanish, and thus became the creator of the Spanish sonnet. He published his poetical works in 1543. His poems are still esteemed, the best edition being that published at Madrid in 1875. Among his works are *'Leandro y Hero'* and *'La Alegoria.'*

Boscawen, Edward, British admiral: b. Cornwall, England, 19 Aug. 1711; d. near Guildford, Surrey, 10 Jan. 1761. He was a son of Viscount Falmouth. Having entered the navy he distinguished himself at Porto Bello (1740) and Cartagena (1741), where he stormed a battery at the head of a part of his crew. In 1744 he was promoted to the Dreadnought, a 60-gun ship, in which he took the French frigate Medea. Three years afterward he signaled himself under Anson, at the battle of Cape Finisterre. Toward the close of this year he was appointed commander-in-chief by sea and land in the East Indies, and was despatched thither with a squadron. He failed in attempts on Mauritius and Pondicherry, and in 1750 returned to England, where he obtained a seat at the admiralty board. In 1755 he became vice-admiral and sailed for North America, and in

an action with a French squadron two ships of the line fell into his hands. It was he who signed the immediate order for the execution of Byng in 1757. In 1758 he was promoted to the rank of admiral of the blue, and in conjunction with Lord Amherst, who commanded the land forces, he was present at the capitulation of Louisburg. The year following, having then the command in the Mediterranean, he pursued the Toulon fleet, under De la Clue, through the Straits of Gibraltar, and coming up with it in Lagos Bay, completely defeated it, burning two ships and taking three. For these services he received the thanks of Parliament and \$15,000 a year, with the rank of general of marines, in 1760.

Bosch, Balthazar van den, Dutch painter: b. Antwerp, 1681; d. 1715. The first work which brought him into notice was an equestrian picture of the Duke of Marlborough, executed in concert with Van Bloemen, who painted the horse. He was afterward employed on a number of works, for which he is said to have received as high prices as Teniers or Ostade; and a short time before his death was appointed director of the Academy of Antwerp.

Bosch, Ernst, German painter: b. Crefeld, 1834. He studied under Schex at Wesel and at the academy in Düsseldorf. His works show a pleasing combination of figure, animal, and landscape painting; many of his pictures excel in humor. Among his best paintings are *'The Smuggler'*; *'Defense of a Block-house against Indians'*; *'Gipsy Gang in the Village'*; *'The Rogues' School'*; *'Hermann and Dorothea at the Spring.'*

Bosch, Hieronymus, Dutch painter and engraver: b. Bois le Duc, Netherlands, about 1462; d. there 1516. His fancy partook of the grotesque, Gothic character of the Middle Ages, and his pictures are ingenious representations of devils, spectres, and the torments of the lost. Some of his works, however, representing scriptural scenes, possess greater dignity. His engravings resemble his paintings, and have become very scarce.

Boschbok, the Dutch form of the English name "bush-buck," given to several South African antelopes, specifically the *Tragelaphus sylvaticus*. It is prized for its venison.

Boschvark, the bush-hog or bush-pig of South Africa (*Charopotamus* or *Potamocharus africanus*), one of the swine family, about five feet long, and with very large and strong tusks. The Kaffirs esteem its flesh as a luxury, and its tusks, arranged on a piece of string and tied round the neck, are considered great ornaments.

Boscobel, England, a parish in Shropshire, unimportant in itself, but remarkable historically as the hiding place of Charles II. for some days after the battle of Worcester, 3 Sept. 1651. Boscobel House belonged at the time to a staunch royalist, and as it was judged a convenient place of retreat, Charles at once proceeded in that direction, and hid himself during the day in the thickest part of the wood. After making one attempt to escape from England through Wales, he was compelled to return again to his former hiding-place, and concealed himself among the branches of a pollard oak in Boscobel Wood, where it is related that he could actually

see the men who were in pursuit of him, and hear their voices. The "royal oak" which now stands at Boscobel, is said to have grown from an acorn of this very tree. An account of Charles' adventures after the battle of Worcester was published in 1662, with the title, 'Boscobel, or the Compleat History of his Sacred Majesty's most Miraculous Preservation after the Battle of Worcester.' This history is said to have been the work of Thomas Blount.

Boscovich, Roger Joseph, Italian astronomer and physicist: b. Ragusa, Dalmatia, 18 May 1711; d. Milan, 12 Feb. 1787. He was educated among the Jesuits, and entering into their order, was appointed professor of mathematics in the Roman College, before he had entirely completed the course of his studies. He was employed by Pope Benedict XIV. in various undertakings, and in 1750 began the measurement of a degree of the meridian in the Ecclesiastical States, which operation occupied him for two years. He afterward visited the Pontine Marshes, to give advice respecting the draining of them. He was then intrusted by the Republic of Lucca with the defense of its interests, in a dispute about boundaries with the government of Tuscany. This affair obliged him to go to Vienna, and having terminated it with success, he visited Paris and London. He was elected a Fellow of the Royal Society, and dedicated to this body a Latin poem on eclipses. Returning to Italy, he was appointed mathematical professor in the University of Pavia; whence, in 1770, he removed to Milan, and there erected the celebrated observatory at the College of Brera. On the suppression of the order of Jesuits, he accepted an invitation to France from Louis XV., who gave him a pension of 8,000 livres, with the office of director of optics for the navy. This appointment induced him to pay particular attention to that part of optical science which treats of the theory of achromatic telescopes, on which subject he wrote a treatise of considerable extent. He was obliged to leave Paris in 1783, on account of ill health, when he retired to Milan. He was one of the first among continental philosophers to adopt the Newtonian theories. An edition of the works of Father Boscovich was published by himself at Bassano, in 5 volumes, 4to, 1785. His 'Theoria Philosophiz Naturalis reducta ad Unicam Legem Virium in Natura Existentium,' first published in 1758, is a curious production containing speculations of which Dr. Priestley availed himself in his writings in favor of materialism. He wrote also 'De Maculis Solaribus.'

Bosio, Angiolina, Italian opera singer: b. Turin, 22 Aug. 1829; d. St. Petersburg, 12 April 1859. At an early age she showed so decided a taste for music, that her parents were induced to place her under the instruction of Cattaneo, at Milan. The best evidence of her progress and talent for singing, was her debut in her 15th year at Milan, in Verdi's 'Due Foscari,' with decided success. Thenceforth a series of triumphs awaited her.

Bosio, François Joseph (BARON), French sculptor: b. Monaco, 19 March 1769; d. Paris, 29 July 1845. He was much employed by Napoleon I., for whom he executed busts of Josephine and Hortense, and by the successive Bourbon and Orleans dynasties. His works are well known in France and Italy.

Bosna-Seraï, or Serajevo (ancient TIBERIOPOLIS), formerly capital of the province of Bosnia, now of the Austro-Hungarian district of Serajevo, situated on the Miliatzka, which is here crossed by a handsome stone bridge, 122 miles southwest of Belgrade, and 570 miles west-northwest of Constantinople. The town was founded about 1263. It is well built, and although most of the houses are of wood, has a gay and pleasant appearance from the number of towers and minarets with which it is embellished. Many improvements have been introduced since the Austrian occupation. It contains a *serai* or palace, built by Mohammed II., to which the city owes its name; many mosques, great and small; churches, monasteries, two large bazaars, schools, baths, and charitable institutions. It was formerly surrounded with walls, but these are now completely decayed; and its only remaining defense is a citadel, built on a rocky height at a short distance east from the town, mounted with cannon. Serajevo is the chief mart in the province, the centre of commercial relations between Turkey, Austria, and South Germany; and has, in consequence, a considerable trade. It has manufactures of arms and utensils of copper; ironware, woolen and worsted stuffs, morocco leather, cottons, etc. There are also several tanneries in the city, and at a short distance from it several important iron mines; and on a plain which stretches to the west the baths of Serajevesko. Pop. 26,286.

Bosnia (properly BOSNA), the extreme northwestern province or eyalet of European Turkey, comprising Bosnia proper, Herzegovina, and parts of Turkish Croatia and Dalmatia, bounded north by the river Save, west by Dalmatia and the Adriatic, east by Servia, and south by Albania and Montenegro. By the terms of the Treaty of Berlin (1878), it was occupied by Austrian troops, to be administered for an undefined future period by the Austrian government. It comprehends, besides the ancient Bosnia, part of Croatia, a tract of Dalmatia, and Herzegovina, and contains from 23,000 to 24,000 square miles (of which Bosnia proper occupies 16,200). The inhabitants are mostly of Slavonian origin, and comprise Bosniaks, Servians, Morlaks, and Croats, besides Turks, Greeks, Jews, Gypsies, etc. The Bosniaks are the most numerous. They are partly Mohammedans, partly Roman and Greek Catholics. The Servians and Croats are next in point of number. The country is level toward the north; in the south mountainous and woody. Its chief rivers are the Save, the Verbas, the Bosna, Rama, and Drina. Bosnia contains fertile fields, orchards, and vineyards; the breed of cattle is excellent, and the mountains furnish good iron, of which a great part is manufactured in the country into guns and blades. The other articles manufactured are leather, morocco, and coarse woolen cloths. In the 12th and 13th centuries Bosnia belonged to Hungary. In 1339 it fell into the hands of Stephen, king of Servia. After his death it remained independent, and the Ban Twartko took the title of king in 1370. In 1401 it became tributary to the Turks, and since 1463 has been a Turkish province. It is divided into the southern and northern parts, or Upper and Lower Bosnia. The former is commonly called Herzegovina (q.v.). The capital of Bosnia is

Bosna-Serai (q.v.); Zvornik, Banyaluka, Mostar, and Travnik are also important places. The Bosniaks are boorish in their manners and uncourteous toward strangers, but industrious and temperate. The women, like the men, are well and strongly made, and mostly good-looking. The Bosniaks are fond of hunting and fishing, and engage to some extent in agriculture and cattle-raising. Servian is the language generally spoken. Bosnia has often attempted to throw off the Turkish yoke, and after the Russo-Turkish war of 1877-8, which was led up to by an insurrection in Herzegovina and Bosnia, the provinces were with the consent of the great powers occupied by Austria. Pop. including Herzegovina (1895) 1,591,036.

Bosporus, or **Bosphorus** (that is, "Oxford"), the strait, 18 miles long, joining the Black Sea with the Sea of Marmora, called also the Strait of Constantinople. It is defended by a series of strong forts, and by agreement of the European powers no ship of war belonging to any nation shall pass the strait without the permission of Turkey. The shores of the Bosporus are elevated and the scenery picturesque. Over this channel (about 3,033 feet wide) Darius constructed a bridge of boats, on his expedition against the Scythians. The Cimmerian Bosporus was the name given by the ancients to the strait that leads from the Black Sea into the Sea of Azov, now the strait of Kaffa or Yenikale, the other Bosporus being distinguished as the Thracian Bosporus. There was anciently a Greek kingdom of the name of Bosporus, so called from the Cimmerian Bosporus, on both sides of which it was situated. The capital of this kingdom was Panticapæum (represented by the modern Kertch), in the Tauric Chersonese, the ancient name of the Crimea. This kingdom was founded about 480 B.C. Spartacus was among the first kings. Under a successor, Satyrus, the kingdom was extended to the coast of Asia, and his son Leucon farther extended it. He improved the commerce of the country (in particular by the exportation of corn to Athens, also of fish, fur, skins, bees'-wax, and slaves). From him his descendants were called Leuconidae. Leucon became tributary to the Scythians 290 B.C., and the tribute was finally so oppressive that Parisades, the last of the Leuconidae, preferred to submit to Mithridates king of Pontus, who vanquished the Scythians under Scilurus 116 B.C., and made his son king of Bosporus. At the death of Mithridates the Romans gave the country, 64 B.C., to his second son, Pharnaces, who was afterward murdered. The Romans placed different princes successively upon the throne, who all pretended to be descendants of Mithridates. When this family became extinct, 259 A.D., the Sarmatians took possession of the kingdom, from whom it was taken by the Chersonesians in 344. The Tauric Chersonese then belonged to the Eastern Empire, till it was seized by the Chazars, and afterward by the Tartars, under the Mongol princes.

Bosquet, bos-kā, **Pierre François**, French soldier: b. Mont de Marsen, France, 8 Nov. 1810; d. Toulouse, 5 Feb. 1861. In 1829 he entered the Polytechnic School, and, in 1833, became a sub-lieutenant in the artillery. In 1835, he went with his regiment to Algeria, where he began to distinguish himself. Be-

tween 1836 and 1848 he had passed through the successive ranks of captain, chef-de-bataillon, lieutenant-colonel, and colonel, when, in that year, he was appointed by the Republican government general of brigade. In 1854 the Emperor Napoleon III. raised him to the rank of general of division, and enrolled him in the staff of the army of Marshal St. Arnaud. He was with the French army in the Crimea, where he greatly distinguished himself, and was wounded in the assault on the Malakoff Tower at the siege of Sebastopol. In 1856, he was made a marshal of France, and a senator. In 1859, he was appointed to a command in the war against Austria.

Boss, **Lewis**, American astronomer: b. Providence, R. I., 26 Oct. 1846. He was graduated at Dartmouth College, in 1870; astronomer of the Northern Boundary Survey for the determination of the line between the western part of the United States and British America; and, since the completion of that work, director of the Dudley Observatory, Albany, N. Y. He was chief of the United States party sent to Chile in 1882 to observe the transit of Venus; was elected a member of the National Academy of Science, in 1889, and an honorary foreign associate of the Royal Astronomical Society, in 1890. He is best known for his work upon star declinations, undertaken in connection with his work on the boundary survey, which is the most complete investigation of the kind ever executed, and for his 'Catalogue of 8,241 Stars'—which was a part of the 'Co-operative Catalogue' prepared by leading astronomers of Europe.

Boss, a master or overseer, a term often applied to the superintendent of a gang of workmen. In American politics, the term came into use, after the exposure of the Tweed Ring, to designate the leader of a political organization who retains his power by unscrupulous methods and the use of public offices as rewards for his supporters.

Boss, in Gothic architecture the protuberance in a vaulted ceiling formed by the junction of the ends of several ribs, and serving to bind them together; usually elaborately carved and ornamented.

Bosse, bōs, **Abraham**, French engraver and etcher; b. Tours, 1605(?); d. there, 1678. He lived most of his life in Paris and was professor in the Royal Academy of Painting there. He prepared about 800 plates representing festivals and various scenes in the life of the people. He wrote also 'Traité des Manières de Graver en Taille Douce sur l'Airain par l'Eau Forte et les Vernis Durs et Mols.'

Bosse, bōs-sē, **Robert**, German statesman: b. Quedlinburg, 1832. He studied law at Heidelberg, Halle, and Berlin, held different offices in Prussia, and in 1876 he entered the Prussian ministry. In October 1889 he became under-secretary of state in the imperial Department of the Interior, and in this capacity had an important part in framing the laws for the insurance of workmen, and in defending them in the Reichstag. In 1891 he became secretary in the Department of Justice, and was president of the commission to frame the new Civil Code. In 1892 he again entered the Prussian ministry as minister of education. He was

editor of the 'Monatsschritte für Deutsche Beamte'; and he wrote 'Commentary on the Laws of 1889 for the Insurance of Invalids and the Aged'; 'An Official Journey to the Orient' (1900) and several articles in sociological and legal periodicals.

Bossi, Enrico Marco, ěn-rĕ'ko mār-kō bōs-sĕ, Italian composer: b. Salò, 1861. He was educated at the Milan Conservatory, was organist in the Como cathedral and instructor in organ-playing at the Naples Conservatory. His musical compositions include an organ concerto, 'Il Cieco,' an opera, and 'Canticum Cantorum,' a sacred cantata. He has written (with Tebaldini) 'Method of Study for the Modern Organ.'

Bossi, Giuseppe Carlo Aurelio, Italian politician and poet: b. Turin, 15 Nov. 1758; d. Paris, 20 Jan. 1823. When only 18 years old he made a successful début as a dramatist. In 1792 he was sent on a diplomatic mission to Berlin, and a few months later to St. Petersburg. In 1796 King Charles Emanuel IV. appointed him his agent near Gen. Bonaparte. He acted a somewhat conspicuous part in the various changes imposed upon the Sardinian states by the directory and the consular government of France; and finally was, with Carlo Giulio and Carlo Botta, a member of the triumvirate which governed Piedmont previous to its annexation in 1802. Some two years later he entered the French civil service, and was appointed prefect of Ain. In 1810 he was made a baron of the empire, and promoted to the prefecture of Manche, which post he kept on the first restoration; but having, in March 1815, adhered to Napoleon, he was dismissed on the second return of the Bourbons. He wrote some lyrical poems, and also 'L'Indipendenza Americana,' 'La Olanda pacificata,' in two cantos, and 'Oromasia,' in 12 cantos, giving a description of the principal events in the French revolution.

Bossuet, Jacques Bénigne, Bishop of Meaux: b. Dijon, 27 Sept. 1627; d. 16 April 1704. While attending the Jesuit College at Dijon he got possession of a Latin Bible, which made an indelible impression upon him. At the age of 15 he was sent to Paris, where he entered the College of Navarre, the president of which, Nicholas Cornet, took pleasure in forming his mind. Bossuet, under the direction of this worthy teacher, studied Greek and the Holy Scriptures, read the ancient classics, and investigated the Cartesian philosophy. He was made Doctor of the Sorbonne and canon in Metz. Here he edified his hearers by his preaching and example; was commissioned by his bishop to refute the catechism of the Protestant minister Paul Ferry, and did it in such a way that even his antagonists were obliged to respect him. The queen-mother (Anne of Austria) was induced, by this work, to employ Bossuet in the conversion of the Protestants in the diocese of Metz. This business often called him to Paris, where his sermons met with great approbation. The sermon which he delivered in 1668, on the occasion of Marshal Turenne's joining the Roman Church, procured him the bishopric of Condom. In 1670 the king charged him with the education of the dauphin. In consequence of this appointment he resigned his bishopric in 1671, because he thought it inconsistent with his duty to retain it during a

continual absence from his diocese. At this time he delivered his sermon at the funeral of Madame the Duchess of Orleans—a princess who, in the midst of a brilliant court, of which she was the ornament, died suddenly in the bloom of youth. His last sermon of this kind (that at the tomb of the great Condé) is considered as a masterpiece. The manly vigor which characterized his orations is seen also in the 'Discours sur l'Histoire Universelle,' designed for the instruction of his royal pupil. The care which he took of the education of this prince was rewarded in 1680 by the office of the first almoner of the dauphin; in 1681 by the bishopric of Meaux; in 1697 he obtained the dignity of a counselor of state, and a year afterward that of the first almoner of the Duchess of Burgundy. His practice and his doctrine were equally severe. All his time was divided between his studies and the execution of his official duties; he seldom allowed himself any recreation. The learned Benedictines of the Brotherhood of St. Maur published a complete edition of the works of Bossuet in 43 volumes 8vo (Versailles 1815-19). Bossuet was unrivaled as a pulpit orator, and greatly distinguished for his strength and acumen as a controversialist. Among the most celebrated of his works are his 'Oraisons Funèbres'; 'Histoire des Variations des Eglises Protestantes'; 'Politique tirée des propres Paroles de l'Ecriture Sainte.' The French Academy consider him among their most renowned members. He has described his own life at length. For his dispute with the archbishop of Cambrai, Fénelon, see FÉNELON and QUIETISM.

Bossut, Charles, French mathematician: b. Tartaras, in the department of the Rhône, 11 Aug. 1730; d. 14 Jan. 1814. He was educated at the Jesuit College, Lyons, and having met with the 'Eloges of Fontenelle,' was smitten with so eager a desire to imitate the distinguished individuals therein described, that he wrote to Fontenelle himself on the subject. That veteran, now 90 years of age, not only answered the letter, but expressed such an interest in the future progress of his young correspondent, that Bossut repaired to Paris, and was introduced by Fontenelle to Clairaut and D'Alembert, the latter of whom he appears to have particularly admired and studied to imitate. In 1752 he was appointed professor of mathematics to the school of Mézières, and held that office for 16 years, during which he gained several prizes offered by the Academy of Sciences. He was afterward admitted a member of that body, and was at the same time appointed examiner of candidates for the artillery and engineers. At the Revolution he was deprived of all his appointments, and afterward lived in retirement till his death. His most important works are a 'Course of Mathematics,' which was long in repute as a textbook; a 'Treatise on Hydrodynamics'; the 'Introductory Discourse to Mathematics,' and various other articles in the Encyclopédie; and a 'History of Mathematics.' He also edited the works of Pascal.

Bostanji, a class of men in Turkey, numbering about 600, originally the Sultan's gardeners, but now also employed in several ways about his person, as mounting guard at the seraglio, rowing his barge, etc., and likewise in attending the officers of the royal household.

BOSTON

Boston, England, a municipal and parliamentary borough and port of Lincolnshire, situated on the river Witham, about five miles from the sea, 32 southeast from Lincoln. It derived its name (a corruption of Botolph's town) from St. Botolph, who founded a monastery here about the year 650. Its chief interest for Americans lies in the fact that it was the English home of the most influential of the settlers of Boston, Mass. The port had formerly a flourishing trade, but owing to various causes, and especially the fact that in dry seasons the river became choked up with sand brought in by the tides, this trade greatly declined. In 1881 a new channel was constructed so as to bring the town within three miles of the sea by navigable water; and a new dock of seven acres area, capable of admitting vessels of 3,500 tons at the highest tides, was opened three years later. Boston contains some fine buildings, notably the parish church of St. Botolph, the Cotton chapel, and various other places of worship, a grammar-school dating from 1554, the Athenæum, the Guildhall, and the Assembly rooms, under which are arranged the butter-market, poultry-market, and the police-station. St. Botolph's Church is a very large and handsome Gothic structure, with a tower, known as Boston Stump, 282 feet high, containing a carillon of 36 bells cast at Louvain. In the upper part of the tower, octagonal in shape, lights used to be suspended for the guidance of mariners at sea and travelers crossing the fens by night. The town is now well supplied with water brought from a reservoir distant about 14 miles. The leading industries comprise iron and brass foundries, the manufacture of farm implements, sails, ropes, and bricks, and tanning, brewing, and malting. Fishing also gives occupation to many of the inhabitants, and there is steam communication with Hamburg, Hull, and London. Pop. (1901) 157,111.

Boston, Mass., the capital of the State, and, according to the United States census of 1900, fifth city in population in the United States. It is situated on the western shore of Massachusetts Bay. The settlement from which it has grown was made in 1630 by members of the Massachusetts Bay Company, bearing with them the charter granted to this organization by Charles I. The leader of the first expedition of settlers who landed at Charlestown, 17 June 1630, was Gov. John Winthrop, a Puritan gentleman. In his fleet came others of like condition, Sir Richard Saltonstall, Isaac Johnson and his wife, the Lady Arbella, daughter of the Earl of Lincoln, together with a company of sturdy Puritans, chiefly from Lincolnshire. They landed 700 or 800 strong, a number soon increased to 1,000 and then to 2,000 by later arrivals—the most considerable settlement on the American coast. At the end of the first summer, a season of hardship, they moved across the Charles River to the promontory of Shawmut—an Indian word translated "living fountains." This headland, with ample water-supply, was called by the English settlers Trimountain, from the three-peaked hill, now Beacon Hill, which formed its highest eminence. On 17 Sept. 1630 it was voted to change its name to Boston, after the Lincolnshire town from which some of the chief settlers had come. The origi-

nal settler of the land, the Rev. William Blackstone (q.v.), a scholar who had left England to avoid the "lord-bishops," sold the newcomers his land and moved on to Rhode Island, in order to escape the "lords-brethren."

From the first the power of the Puritan clergy was important. Church and State were practically one. Trained in the English universities, the ministers set a true value upon education. A free public school was established in 1633, and in 1636 the General Court provided for the beginnings of Harvard College. The government both of town and of colony was purely democratic, having for its unit the town-meeting, which in Boston itself maintained its sway, with the single interruption of British military rule at the outbreak of the Revolution, until the town became a city in 1822. Besides the training in self-government thus acquired, Boston had the advantage of virtual independence through its early years. At first the Crown was fully occupied with its own problems in England; and when Cromwell came into power, so strongly Puritan a settlement was naturally left much to its own devices. Thus the charter of the Bay Company, and the liberties enjoyed under it, became very dear to the people of Boston. When Charles II. came to the throne there were grave fears that these liberties would be seriously curtailed. In 1664 four royal commissioners came from England to adjust difficulties in several colonies. Their mission to Boston was a failure, and for some years to come the town was secure under its original system of government.

Under James II. came the dreaded change. Complaints of the Boston spirit of independence and religious intolerance were borne more frequently to the English court, and before the death of Charles II. the Court of Chancery voted the Massachusetts Bay charter vacated. In the summer of 1686 the original government of the colony came to an end. Before the close of this year, Sir Edmund Andros, the new governor appointed by the king, the first chief magistrate in Massachusetts not chosen by popular election, arrived in Boston. Probably nobody in his peculiar place could have satisfied the people at this time. Within less than three years from his arrival a bloodless revolution in Boston, a well-organized uprising of the people, removed him from office. Early in 1690 he was sent back to England, where Increase Mather, the leading minister of Boston, had already been for nearly two years, trying to have the old charter restored, or to get the best possible substitute for it. This he succeeded in doing, after the accession of William and Mary, and had the further satisfaction of choosing the first governor under the new instrument making Massachusetts a royal province. With this governor, Sir William Phipps, Mather returned to Boston in the spring of 1692.

By this time Boston had grown to importance as the leading seaport, and in many respects the foremost town in America. Before the end of the 17th century its population was approximately 7,000. In another half century this number was more than doubled. A good idea of certain aspects of the town in this period is given by an Englishman, Daniel Neal, who wrote in 1719:

"The bay of Boston is spacious enough to contain in a manner the navy of England. The masts of ships here, and at proper seasons of the year, make a kind of wood of trees like that we see upon the river of Thames about Wapping and Limehouse, which may easily be imagined when we consider that by computation given into the collectors of his Majesty's customs to the governor upon the building of the light-house, it appeared that there was 24,000 ton of shipping cleared annually.

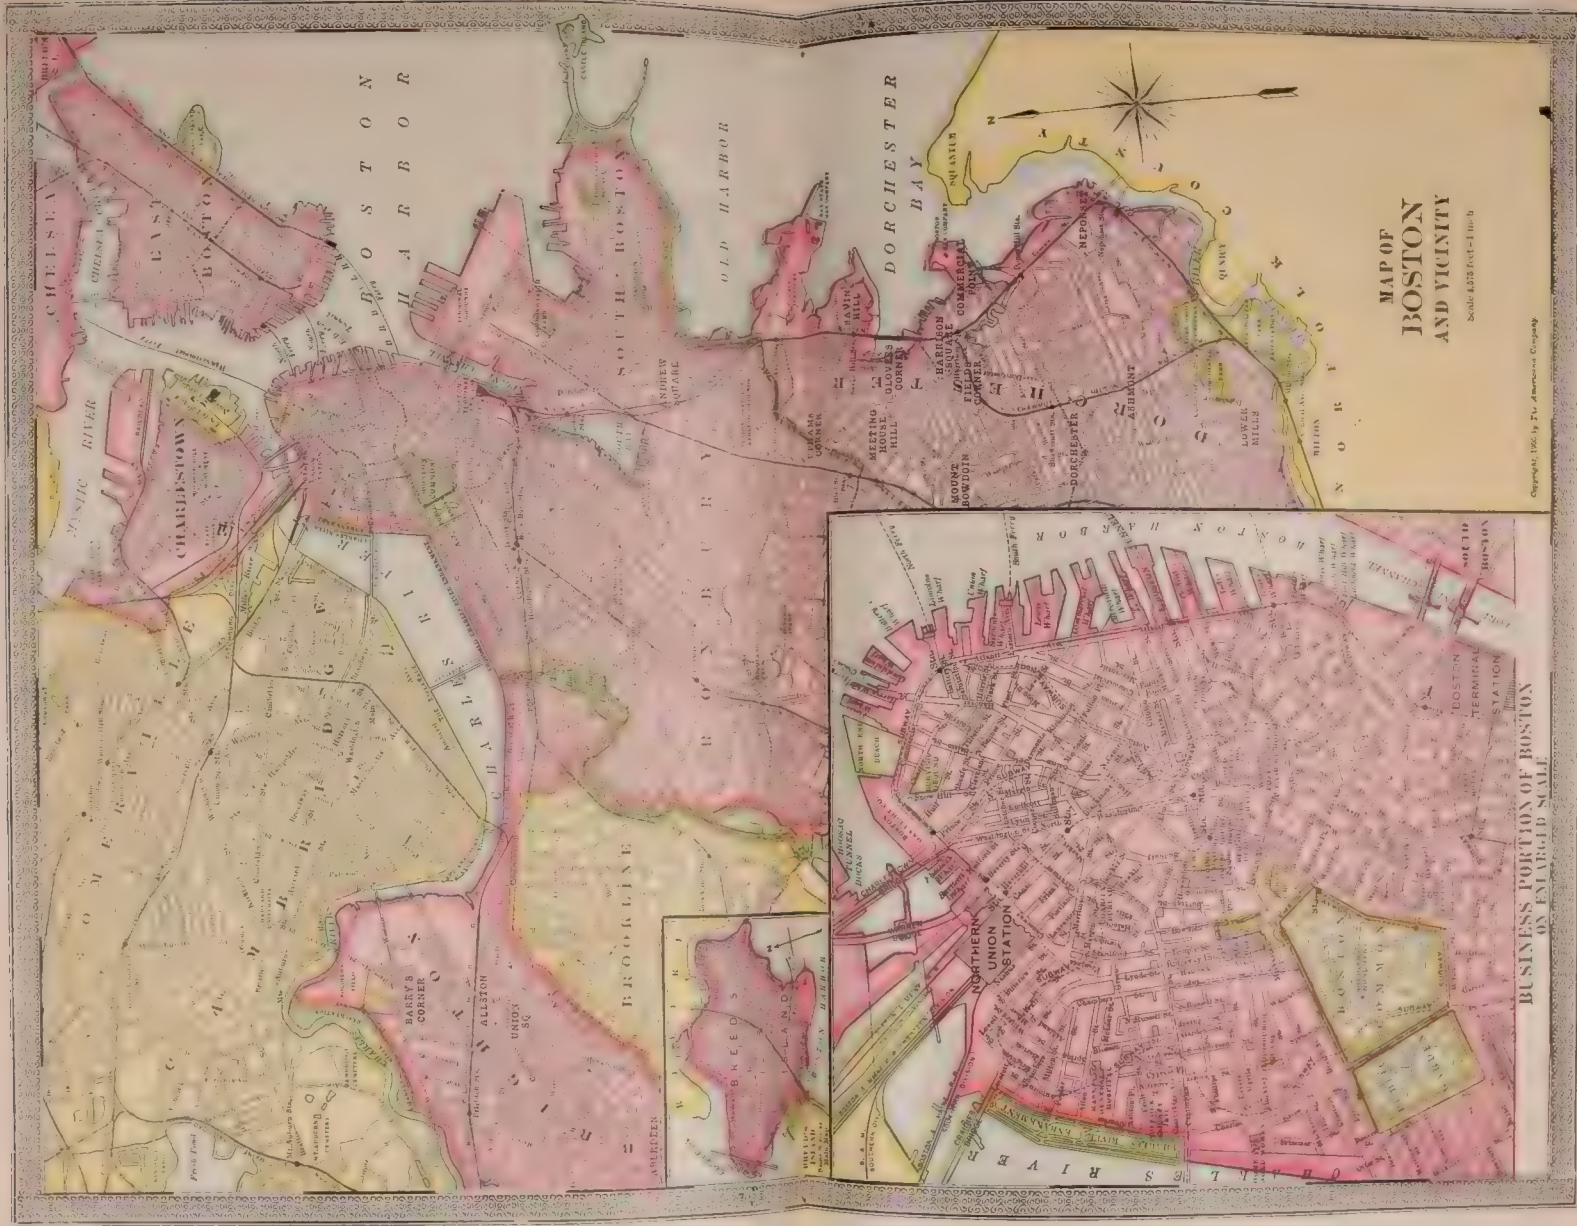

"At the bottom of the bay is a noble pier 1,800 or 2,000 foot long, with a row of warehouses on the north side for the use of merchants. The pier runs so far into the bay that ships of the greatest burthen may unlade without the help of boats or lighters. From the head of the pier you go up the chief street of the town [now State Street], at the upper end of which is the town house or Exchange, a fine piece of building, containing, besides the walk for the merchants, the Council-Chamber, the House of Commons, and another spacious room for the sessions of the courts of justice. The Exchange is surrounded by booksellers' shops, which have a good trade. There are five printing presses in Boston, which are generally full of work, by which it appears that humanity and the knowledge of letters flourish more here than in all the other English Plantations put together; for in the city of New York there is but one bookseller's shop, and in the Plantations of Virginia, Maryland, Carolina, Barbadoes, and the Islands, none at all."

As in the 17th so in the 18th century, the clergy and ecclesiastical affairs loomed large upon the local horizon. The prominence in Boston records of what is known as the "Mather dynasty"—of which Increase and his son, Cotton Mather, were the chief figures—bears witness to this condition. The younger of these Puritan priests is remembered largely for his connection with the witchcraft delusion, which had its worst effects in Salem, but in temporal matters and humanitarian work he impressed himself no less forcibly on the life of his time. Of the devout laity, educated at Harvard College, giving themselves to public service, living private lives of dignity and piety, Samuel Sewall, whose diary preserves the true flavor of ancient Boston, stands as an admirable type. In contrast with the background of lives like his, the society of which royal governors were the central figures presents a less austere picture. About the governors, established from 1716 onward in a sort of vice-regal state in the Province House, gathered the more worldly element of the place—prosperous merchants, officials of the Crown, members of the King's Chapel congregation and the two other Anglican churches established before the middle of the century. Under the Province charter religious liberty was increasing, and churches of various denominations—including even the Quakers, whose first representatives in Boston were hanged on the Common—had come into being. Meanwhile the constant friction between the governors and the General Court, always meeting in Boston, kept the spirit of political independence wide awake. A fruitful source of trouble was the annual grant voted by the court to the governor. A salary the people steadily refused to pay to an official not of their own choice; and the amount of the grant varied according to the personal popularity of the chief magistrate. Through all these years, moreover, the town-meeting was educating the people in self-rule, so that when the time was ripe for active opposition from American colonists to the colonial government of England, the men of Boston were ready to take a leading part in the struggle.

In 1761 James Otis, advocate-general of the province, resigned his position under the Crown in order to contest the Writs of Assistance,

which permitted customs officials to enter any house, search for smuggled goods, and on suspicion seize what they might find. The argument against these writs was the first of many conspicuous acts of resistance to royal authority. In 1765 the Stamp Act, taxing many articles of daily use in the colonies, was passed by Parliament. Its principle was bitterly resented in Boston, where riotous outbreaks soon took place. A mob completely destroyed the house of Thomas Hutchinson, chief justice of the Province, and was properly denounced by respectable citizens. In the next year the repeal of the act was joyfully celebrated by all classes. In 1770 occurred the "Boston Massacre" (q.v.), the result of friction between the inhabitants and the British troops stationed in the town. In the use of "a word which historians apply to such events as Cawnpore or the Sicilian Vespers"—the word "massacre" to describe "the careless shooting of half a dozen townsmen"—John Fiske finds "all the mildness of New England civilization brought most strikingly before us." The town-meeting was even more typical of this civilization, and from its training Samuel Adams, at about this time, stepped into virtual leadership of the revolutionary cause in Boston. The Committee of Correspondence was formed upon his motion, and out of it grew by degrees the union not only of towns, but of colonies, in their opposition to the throne. On 16 Dec. 1773, occurred the "Tea Party," a cleverly planned and executed plot for throwing into Boston harbor, by men disguised as Mohawk Indians, the cargoes of three vessels bearing tea upon which the people of Boston would not pay the hated tax. Parliament retaliated by passing the Boston Port Bill, which closed the harbor and brought the chief industry of the town, its maritime trade, to a standstill. A military governor, Gen. Gage, took the place of Hutchinson, who had been acting as the chief civil magistrate, and open hostilities were at hand.

The events of 19 April 1775—the warning ride of Paul Revere, the escape of John Hancock and Samuel Adams, the fights at Concord, Lexington, and along the road between the two towns—are the commonplaces of American history. They belong to Boston in so far as the Boston revolutionary leaders were concerned in them, and as the British troops set forth from the town and returned to it defeated. The battle of Bunker Hill in Charlestown, 17 June 1775, bears much the same relation to Boston history. On 3 July Washington arrived in Cambridge and took command of the American army, which from that time until the following March kept the British closely within the lines of the siege of Boston. Many of the inhabitants were permitted early to depart. Those who remained suffered hardships and privations, besides witnessing the destruction of much American property, and such scenes of desecration as the use of the Old South meeting-house as a riding-school. On the night of 4 March 1776 Washington made his memorable seizure of Dorchester Heights (now South Boston), and on the 17th Howe with all his army and a large following of American Tories sailed for Halifax. Thereupon Washington entered the city, and even before the signing of the Declaration of Independence Boston ceased to be a scene of active warfare in the long conflict. Yet John Adams, Hancock, and other Boston men bore

an important part in the counsels of the young nation, in whose army and navy the town was fully represented.

The recovery from the effects of the siege was slow. To take the place of the departed Tories, and to occupy their spacious houses, there was in the remaining years of the 18th century a gradual immigration from the neighboring country (where Tories were few) of families possessing wealth, energy, and qualities of leadership. Local government by town-meeting was resumed. In 1780 a State government for Massachusetts was formed, and John Hancock was chosen the first governor. In the general readjustment maritime affairs took their previous place of importance. Cut off by British legislation from the West India trade, the Boston merchants looked farther abroad. The prospects of the fur trade on the northwest coast of America became known through Capt. Cook's journals, published in 1784. In 1787 two small vessels, the *Columbia* and the *Washington*, sailed from Boston to attempt this trade. Before her return in 1790 the *Columbia* had circumnavigated the globe—first of American vessels to accomplish this feat. The furs collected in the Northwest had been sold in China, and the example thus set led the way to an important trade with the East in which Boston long maintained the American supremacy. In such a seaport as Boston, Jefferson's Embargo and the War of 1812 were naturally unpopular. The Federalist party, moreover, had much of its best strength in Boston. The powerful mercantile class saw its best interests in a strongly centralized government and conditions of general stability. The opinions of this class colored the influential feeling of the community to an extent which laid Boston open to charges of something very near disloyalty to the national government. The crippling of commerce, however, had the good effect of turning capital and energy toward manufacturing. In 1814 Francis C. Lowell, of Boston, made the first American use of the power-loom in his mill at Waltham at almost the same time with its introduction into England. The growth of the great cotton industry at Lowell followed rapidly upon this invention. With the spread of manufactures Boston itself was growing. In 1820 its population was over 43,000. The old form of town government had become unwieldy. For some years efforts had been making toward the adoption of a city charter. In 1822 this was finally achieved.

From the time of this change in local government to the present, the outward growth of the city, as figures can speak for it, has been unbroken. In matters not computed in this way, the development has been in several important respects unique. With Boston, for example, the Unitarian movement in America is especially associated. Before the town became a city there were divisions among the clergy of Congregationalism—practically the established order in New England—on various doctrinal points, notably that of the Trinity. Under the leadership of William Ellery Channing the "liberal" clergy and most of the older and more influential religious societies turned from Calvinism to the new theology. Especially between 1820 and 1830, an acute controversy took place. Between 1840 and 1850 the Unitarian body itself was disturbed by differences between the more conservative

element and the radicals, of whom Theodore Parker was a type. The result of the successive controversies has been a liberalizing of religious beliefs not only in what came to be Unitarian Boston, but in the many Protestant bodies which now acknowledge an important debt to Unitarianism. Another far-reaching movement which had its headquarters in Boston was that of anti-slavery. Here in 1831 William Lloyd Garrison established his journal, the *Liberator*. A year later the first anti-slavery society in America was established in Boston. The agitation of the Abolitionists was for a long time opposed by the conservative class, which resorted even to mob violence in the hope of suppressing the reformers. But to Garrison and his associates it was due, as Mr. J. F. Rhodes has said, "that slavery became a topic of discussion at every northern fireside." When the Civil War broke out, the cause of the union, perhaps even more than that of abolition, enlisted the enthusiastic support of the Boston community; yet, as if in fulfilment of the work which Garrison began, it was from Boston that Gov. Andrew sent forth the first regiment of colored troops raised in the North.

With Boston and its immediate vicinity, moreover, are associated the names which stand for the most important contribution of the 19th century to American literature. Prescott, Ticknor, Bancroft, Motley, and Parkman; Emerson, Hawthorne, Lowell, Longfellow, Holmes, and Whittier,—these and their associates, bound together by many ties of sympathy and friendship, constituted a group of writers which gave the place a unique distinction in letters. The '*Atlantic Monthly*,' founded in 1857, became the vehicle for much of their most characteristic utterance. The influences of Transcendentalism (largely a local movement, culminating in the forties), of anti-slavery feeling, of creative expression, combined to give to this utterance as a whole something of the distinction which the individual writers won each for himself.

During the 19th century two important changes in the Boston landscape affected the future of the city, in the regions both of residence and of business. The first of these was the filling in of the Back Bay, an arm of the Charles River which spread between the Common and the hills of Brookline, running south and east as far as the Neck or narrow strip of land connecting Boston and Roxbury. From the early years of the century changes in the shore line of Boston had been wrought by cutting down the principal hills and filling out the irregularities of the harbor front. The first step in the series of events which led to the conversion of the Back Bay from water into land was the granting of a charter in 1814 to the Roxbury Mill Corporation, permitting the building of dams across the Back Bay and confining its water for mill purposes. To these rights the Boston Water Power Company succeeded in 1832. At about the same time the Boston & Providence and Boston and Worcester railroads invaded the Back Bay with their bridges. Moreover the waters became unsanitary through drainage, and to solve the entire problem, hygienic and legal, a State commission was appointed, and made a full report in 1852. Its recommendations to create the whole tract of land now known as the Back Bay did not at once satisfy the various conflicting interests,

but in 1858 the actual work of filling up the waters was begun. The result was a large enrichment of the State treasury, and the addition to the city of the whole district occupied by the residences, clubs, churches, hotels, and other institutions connected with the most prosperous life of the city. The original peninsula of Boston contained 783 acres. Through its encroachments upon water, largely in the Back Bay, it has grown to 1,829 acres. With the accessions of outlying districts, the total area of the city is now 23,707 acres.

The second great change in the outward aspect of Boston resulted from the great fire of 9 and 10 Nov. 1872. From the beginning of its history Boston had been afflicted by serious fires. This greatest of them all destroyed 776 buildings, all but 67 of which were of brick and stone. It devastated Summer Street (both sides), Washington Street from Summer to Milk, Milk Street to the post-office, Devonshire Street, Water (both sides), Congress, Lindall and Oliver streets to the harbor. From the corner of Washington and Franklin streets the shipping at the wharves was in clear view. Nearly 2,000,000 feet of land were burned over. The total loss was estimated at more than \$75,000,000. Yet by private enterprise and State aid the recovery was immediate. The opportunity to widen and straighten streets in the business district was seized. Stateliner buildings rose in the place of those destroyed, and a new business region, corresponding to the new district of residences, was created.

The census of 1900 gave the population of Boston as 560,192. The metropolitan district, including the 38 cities and towns of which Boston is the centre, has by the same census a population of 1,162,197. The territory within 50 miles of Boston has 2,849,686 inhabitants—a population second in America only to that in the corresponding area about New York. The assessed valuation of all taxable property in Boston itself is \$1,191,308,100—a figure surpassed in the United States only by the corresponding figures for New York and Philadelphia.

The city government is conducted by a mayor, elected for two years, salary \$10,000; a board of 13 aldermen, elected annually; and a common council of 75 members, three for each ward, elected annually. The fire department is controlled by one commissioner, the police and health departments by three each. The school committee consists of 24 members, of whom 8 are elected annually for a term of three years. In the 807 public schools under their charge there were, according to the 'Boston Municipal Register for 1902,' 1,939 teachers and 84,778 pupils.

The park system of Boston is under the joint control of the Metropolitan Park Commission (appointed by the governor of Massachusetts) and the Board of Park Commissioners (appointed by the mayor of Boston). These commissioners serve without pay. In the Metropolitan system are included the Blue Hills Reservation (4,232 acres), the Middlesex Fells and Mystic Lakes (3,002 acres) and smaller reservations, including 66 acres at Revere Beach, where the State bath-house of 1,000 rooms provides the best facilities for sea-bathing. To the Board of Park Commissioners falls the management of the Marine Park at South Bos-

ton, Franklin Park at West Roxbury, Arnold Arboretum at Forest Hills, boulevards, fens, playgrounds, and open-air gymnasia. The Common (48½ acres) and the adjoining Public Garden (24¼ acres), both in the heart of the city, are in charge of the Public Ground Department of the city of Boston. The State commission acts in consultation with local boards, including that of Boston, and serves the people of 12 cities and 25 towns within a radius of 25 miles from the State House. The general park system thus provided is remarkable for its beauty, accessibility, and actual benefit to the community. The work of the city bath department is a characteristic example of municipal service to the people. The five trustees of this department maintain seven beach baths, one river bath, two swimming-pools, nine floating baths, five gymnasia, and the Dover Street bath-house, a model building with free baths for men and women throughout the year. Metropolitan commissions of water and sewerage corresponding to the Park Commission, serve the city and surrounding towns. The water-supply is drawn from lakes and rivers in eastern Massachusetts,—the Sudbury River, Mystic Lake, Lake Cochituate, and watersheds of wide area. A city water department does its separate work in connection with the Metropolitan Commission.

The churches of Boston, according to the 'City Directory' of 1902, are 309 in number. Of these 50 are Roman Catholic (including Polish, German, Italian, French, Portuguese, and Syrian parishes), 38 are Baptist, 37 Congregational-Trinitarian, 34 Methodist-Episcopal, 32 Protestant Episcopal, 25 Congregational-Unitarian, 13 Lutheran, and 10 Universalist, with others in smaller numbers. The First Church of Christ (Scientist) is the "mother church" of "Christian Science" throughout the country and the world. Charitable organizations, both municipal and private, abound, and enlist the unpaid services of a large class in the community. An admirable organization of Associated Charities gives direction to the proper sources or seeks to obtain therefrom for the sick and needy adequate and suitable relief. The principal hospitals are the Boston City Hospital, a city institution, the Massachusetts General, supported by private endowment, the Carney, in charge of Roman Catholic Sisters of Charity, and the Massachusetts Homœopathic. These are open to persons of all races and creeds. In the Massachusetts General Hospital in 1846 the properties of ether as an anæsthetic were first demonstrated. From the discovery then made the progress of modern surgery took its first great step. There are, besides the institutions mentioned, many smaller hospitals for special classes, children, women, etc. The provisions for industrial training and the education of defectives are ample. The Perkins Institution and Massachusetts School for the Blind (incorporated 1829) typifies the good work they have done and are doing. Here Dr. Samuel G. Howe did his memorable pioneer work in the case of Laura Bridgman.

As a centre of higher education in many branches Boston attracts and maintains a large population of students. The Public Library, housed in one of the most beautiful buildings in the country, and distributing its more than 800,000 volumes through 10 branch libraries and 21 delivery stations throughout the city, puts the

COPLEY SQUARE, BOSTON.

MUSEUM OF FINE ARTS, BOSTON.

BOSTON CASE—BOSTON MASSACRE

materials of scholarship within the reach of all. Harvard University is close at hand. Its Medical School is in Boston itself. Here also are the Massachusetts Institute of Technology, Boston University, the Boston Museum of Fine Arts, with its School of Drawing and Painting, and the New England Conservatory of Music, supplemented by the concerts of the Boston Symphony Orchestra. The courses of free lectures provided by the Lowell Institute, established in 1838, with an original endowment of \$237,000, have made a constant contribution to the cause of general education. If the suggestion to co-ordinate these and the many other educational institutions of Boston into a general university is ever carried out, the place may well become one of the foremost centres of organized learning in the world.

In 1894 the Union Station at the North End of the city brought together the terminal facilities of all the railroads connecting Boston with northern New England, with Canada, and, through Fitchburg, with the West. On 1 Jan. 1899 the first train entered the South Station, the largest railway terminal in the world. Here the railroads connecting Boston with southern New England, New York, the South, and the West, by way of Albany, meet under one roof. The North and South Stations are connected both by surface and by elevated electric cars—a part of the system of the Boston Elevated Railway. This company has succeeded to the rights of the several street railways formerly holding franchises, and by surface cars, elevated lines, and subways, upon which the underground systems of other cities have been modeled, gives the city, with the attractive and accessible suburbs for which Boston has always been noted, a rapid-transit service of unusual comfort and effectiveness. The subway system will be still further extended, first of all by the completion of the tunnel now building under the harbor to connect Boston and East Boston.

In the Rivers and Harbors Bill passed by the United States Congress in June 1902 an appropriation of \$3,600,000 was made for the improvement of Boston Harbor. Its expenditure in making a broader and deeper channel from Charlestown and Chelsea bridges to the sea is expected to forward the progress made in recent years by Boston as a seaport. Its ample harbor, well protected from the sea by islands, has always played an important part in the life of Boston. In foreign commerce for the government fiscal year ending 30 June 1902, Boston stood second in the United States only to New York, with imports and exports valued at \$172,325,740. For peculiar temporary causes this was smaller by more than \$40,000,000 than the volume of trade for the year before. Fourteen transatlantic steamship lines run from Boston. The coastwise commerce of the port is valued, in merchandise, in sums ranging annually between \$85,000,000 and \$131,000,000. As a wool market Boston stands second in the world only to London. In the single week of 1901, in which Boston made its greatest record in the sales of wool, it sold more than the total clip of any State in the Union, excepting Montana and Idaho, for that year. In the business of shoes, leather, and hides, Boston is the chief distributing centre of the United States. The trade in salt and fresh fish—as befits the capital of the State with a cod for its emblem—

is larger than in any other city of the country. The cotton industry of Massachusetts looks to Boston for much of its capital and control. Miscellaneous trades and manufactures, added to the branches of business enumerated, give Boston a high place among the commercial and industrial cities of the country.

In the growth from an ancient to a modern city many historic buildings have inevitably disappeared. But Boston is fortunate in a few of those that remain. Chief among these are Christ Church (1723), the Old South Meeting-house (1729), Faneuil Hall (1742, enlarged in 1806), the Old State House (1748), King's Chapel (1749, built around the previous wooden church erected in 1688), the front portion of the present State House (1795-8), and Park Street Church (1809).

'The Memorial History of Boston' (Boston 1881) in four volumes, edited by Justin Winsor, completely covers the local history from 1630 to 1880. Its chapters are written by persons with special knowledge of the themes assigned them. 'Boston,' by Henry Cabot Lodge in the series of 'Historic Towns' (New York 1892) is an excellent shorter history.

M. A. DEWOLFE HOWE,

Author of 'Boston: The Place and the People.'

Boston Case, in the history of slavery, a case where a Georgia slave hid or was hidden on the ship Boston returning from Georgia to Maine, and on arrival escaped to Canada. The governor of Georgia issued a requisition to the governor of Maine for the surrender of the captain to the Georgia authorities, as a slave-stealer and fugitive from justice; and on his refusal, the Georgia legislature demanded that Congress pass a law obligating the governor of Maine and all others in similar cases to comply with the requisitions. The resolution was warmly advocated by the Georgia senators, referred to the judiciary committee, and never reported on. In his next message, the governor of Georgia recommended that "all citizens of Maine who should thereafter come within the jurisdiction of Georgia on vessels, either as owners, officers, or mariners, should be considered to have done so with intent to commit the crime of seducing negro slaves from their owners, and be dealt with accordingly by the officers of justice."

Boston College, an educational institution in Boston, Mass.; founded in 1864; under the auspices of the Roman Catholic Church. Professors and instructors, 20; students in all departments, 477; scholarships, 15; volumes in the library, 34,109; value of grounds and buildings, \$537,000; income, \$17,000; and benefactions, \$3,000. The course is four years leading to the usual academic degrees.

Boston Massacre, a riot in Boston, 5 March 1770, provoked by the presence of the British regiments quartered there since 1 Oct. 1768. On Friday the 2d, some ropemakers started a war of insults with passing soldiers, and on being challenged to a boxing match, used sticks instead, to which the soldiers retorted with cutlasses; several persons were hurt when the fray was stopped by outsiders, but it was reported that it would be resumed Monday. Early Monday evening the soldiers passing to their posts from the main guard, at the head of King (State) Street, were met by a crowd

BOSTON MOUNTAINS—BOSTON PORT BILL

armed with canes and sticks, who refused to make way, and shouted insults; the soldiers were about to force a passage when an officer came up and ordered them into the yard; but the alarm-bell had called out the citizens, the hot-heads wished to assault the main guard, and apparently they and the boys set to harrying the sentinel in front of the custom-house opposite the main guard, who about 9 o'clock hit a specially annoying boy with the butt of his musket. The boy ran off and brought a crowd to the spot, headed by one Crispus Attucks (q.v., apparently a half-breed Indian), and pointed out the sentinel, at which they shouted "Kill him! Knock him down!" The sentinel retreated up the steps and loaded his gun amid a shower of snowballs and other missiles; told Henry Knox who was passing, and counseled him not to fire; that he would if they touched him; leveled the gun and warned off the crowd, and called for help from the main guard across the street. A sergeant and seven men were sent to his help, and he came down and took his place in line; soon afterward Col. Thomas Preston joined them, making 10 in arms. They loaded; the crowd jeered, hooted, taunted them as cowards, dared them to fire, and closed about them; the soldiers drove them back with clubs and bayonets; Preston, in turn warned by Knox, rushed among his men, and either with or without his orders they fired, killing Attucks and two others and mortally wounding two more. The crowd fell back, and Preston prevented the men firing again and rejoined the main guard. The drums beat to arms, and the vicinity was soon thronged with divisions of soldiers and masses of enraged citizens. Lieut.-Gov. Hutchinson quieted the tempest by having Preston bound over for trial, placing the implicated soldiers under arrest, and inducing the officers to order the companies back to barracks; but the next day a town-meeting forced Hutchinson to have the regiments removed to the Castle in the harbor. Preston was tried in October and the soldiers in November before the Superior Court, and defended by Robert Auchmuty, assisted by John Adams and Josiah Quincy, who took their futures in their hands from professional duty; Preston was acquitted, six soldiers were brought in not guilty, and two found guilty of manslaughter, branded in the hand, and discharged.

Boston Mountains, a range in western Arkansas, extending into the Indian Territory; highest summits, 3,000 feet above the sea.

Boston News Letter, 1704-76; the first real newspaper issued in America. A periodical called 'Publick Occurrences,' to be issued monthly, or oftener if "a glut of occurrences" made it advisable, had been essayed in Boston by Richard Pierce, 25 Sept. 1690; but it was instantly suppressed by the authorities as containing "reflections of a very high nature," and the first number was the last. The next venture was by John Campbell (q.v.), a Scotch bookseller and postmaster of Boston, who had been actively writing and sending "news letters" of European occurrences to New England governors for a year or more, and thought it would save trouble to print them for all. With official permission he issued on 24 April 1704 the first number of a weekly consisting of a single leaf, 8 x 12, printed on both sides, and dated

"From Monday April 17. to Monday April 24. 1704." It was printed by Bartholomew Green, for many years one of the best printers of Boston, who in 1722 became its editor. Dying in 1732, he was succeeded by his son-in-law, John Draper, who conducted it till his death in 1762, and made it a representative of the best interests of the province; he was a journalist of the highest character. His son Richard Draper, considered the best news compiler of his day, though in feeble health, edited the paper till his death in 1774, when his widow succeeded him and carried it to the end. Draper had been an ardent loyalist, and firmly supported the mother country in the stormy times of the previous decade; his widow naturally shared his feeling, and when the young man Robert Boyle whom she installed as editor showed sympathy with the Revolution, she replaced him by John Howe, who conducted it till the British evacuated Boston, 17 March 1776, when he and Mrs. Draper left with them and the paper ceased to exist. The British government gave her a life pension. There are only three copies of the first number extant: in the Massachusetts Historical Society at Boston, the American Antiquarian Society at Worcester, Mass., and the New York Historical Society at New York. A facsimile of the first page is given in the 'Memorial History of Boston,' Vol. II., page 389. See *NEWSPAPERS, AMERICAN*.

Boston Port Bill, of 31 March 1774, was Great Britain's retort to the destruction of the tea in Boston harbor, 16 Dec. 1773. (See *BOSTON TEA PARTY*.) The maintenance of English authority by force, or abdication in favor of a party which would maintain it, were the only alternatives left to the government. The King's Speech of 7 March 1774 charged the colonists with attempting to injure British commerce and subvert the constitution; and on the 18th Lord North brought in the Port Bill, providing that there should be no further "landing or discharging, lading or shipping of goods, wares, and merchandise at the town and within the harbor of Boston" till the town paid for the tea and promised submission to the laws; that the colony's seat of government should be removed to Salem, and Marblehead made a port of entry; the act to take effect 1 June. Even some of the best friends of America in Parliament at first approved it as moderate and reasonable, as the town could end the punishment at any moment by paying for legitimate merchandise destroyed by riot, and allowing law and order to have their course; but the Whig opposition soon collected itself, and the bill was fought in its various stages by Burke, Barre, Pownall, and others. In spite of them it became a law 31 March, without a division in the Commons, and by unanimous vote in the Lords. The fleet and army were of course to join in enforcing the blockade; Boston was filled with troops, and Gage made commander-in-chief. The immediate results were: a flood of contributions from the other New England towns, of grain and provisions, so great that the Boston leaders boasted that it would become the chief grain port of America if the act were not repealed; and, in connection with the regulating acts for changing the government of the province passed soon after, a speedy union of the colonies for joint defense.

BOSTON SYMPHONY ORCHESTRA — BOSTON TERRIER

Boston Symphony Orchestra, a large orchestra organized in Boston in 1881, having about 80 members in 1903. It gives a series of concerts in Boston annually, and in 1900 inaugurated a series of Wednesday afternoon concerts in New York. Daily rehearsals are the rule throughout the season, and the orchestra plays only at concert performances. The conductors are now appointed for five years; the conductor in 1903 was William Gericke; others who have held the position are, George Henschel, the first, Arthur Nikisch, and Emil Paur.

Boston Tea Party, 16 Dec. 1773. Till shortly before the Revolution, imported teas paid a shilling a pound duty at English ports; but the merchants received a drawback of three fifths on exports to the colonies, who were charged the remaining $4\frac{1}{5}$ d. in the selling price. As they obtained it more cheaply by smuggling from Holland, there was no English tea trade. In 1767, as part of a series of duties to raise revenue for paying the colonial executives and judiciary, to make them independent of popular control, this duty was reduced to 3d., but to be collected at American ports. This was done with the threefold object of aiding the straitened East India Company to market its tea; substituting a small collectible duty for a larger uncollectible one; and helping to break up the illicit free-trade which was the life of the colonies. The political purposes made Americans invincibly hostile to it. Associations were formed to abstain from the tea, merchants who handled it lost custom, and the Dutch smuggling went on. In 1770 the other new duties were repealed, but that on tea remained. In 1773 the East India Company, with 17,000,000 pounds of unsalable tea stored in London warehouses because of this non-importation, and in imminent danger of a failure most disastrous to English financial and political interests, asked Parliament for a colonial drawback of the entire shilling, to undersell the Dutch. This was granted 10 May, tea ships were sent to Boston, New York, Philadelphia, and Charleston, and consignees or "tea commissioners" appointed in each place. But the colonies were now resolved that no taxes, external or internal, should be paid except under their own control, and set themselves to prevent the collection of the duty. In the other cities than Boston this was done by forcing the consignees to resign, and in New York and Philadelphia the ships were sent back without unloading. In Charleston the duty was left unpaid for 20 days, when by law the customs officers seized it and offered it for sale to pay the charges, but as no one dared buy it, it spoiled unused. In Boston the tax was defeated by the refusal of the consignees — two sons of Gov. Hutchinson and three loyalist friends of his, to resign. On Sunday, 28 November, the Dartmouth, under Capt. Hall and owned by the Quaker Francis Rotch, arrived with 114 chests of tea, and was moored at Griffin's wharf. The committee of correspondence which really governed the province, induced Rotch to defer its entry until Tuesday, and on Monday morning called a great mass meeting at the Old South Church, which resolved that Rotch would enter the tea at his peril. The captain was cautioned to let none be landed, and a watch of 25 men was stationed at the wharf. The consignees, asked to send

the tea back, replied that it was not in their power, but they would store it till they could hear from their constituents. Tuesday afternoon, however, Rotch and Hall agreed to return it without its touching land or paying duty; and the owners of two other ships which arrived shortly after, the Eleanor and Beaver, made the same promise. These ships were moored at the same wharf, so that one guard might serve for all. But by law the ships could not be cleared till the cargo was discharged, and Hutchinson refused to give the owners permits to pass the Castle; had the guns loaded, and Admiral Montagu guarded the mouth of the harbor with two war-ships, though curiously neither of them put a guard on the tea ships. At midnight on the 16th, the Dartmouth's 20 days would expire, and the American victory be practically won by the seizure of the tea for unpaid duty, since none of it would come on the market. But the object of the Boston leaders was not merely to prevent the English exchequer profiting, but to commit the colony to open disobedience of English orders, and have some issue to unite upon with the other colonies. On the 14th Rotch was again ordered by a meeting at the Old South to apply for a clearance, and several leading patriots escorted him to the custom-house to see that he did so. The collector refused to give an answer till the next day, when, upon a final visit from Rotch and his volunteer bodyguard, he definitely refused unless the teas were discharged. At 10 the next morning Rotch appeared before another huge meeting at the Old South and reported the refusal. He was directed to protest against it at once, and apply to Gov. Hutchinson for a permit to pass the Castle. Hutchinson was at his house on Milton Hill, some eight miles out; and it was 6 p.m. before Rotch returned with the news that the governor also refused. Meantime some 7,000 people had gathered in and about the Old South, probably half of them from neighboring towns; addresses were made by Samuel Adams, Josiah Quincy, and several other leaders, and it was unanimously resolved that the tea should not be permitted to land. Hutchinson's refusal had been discounted, and 40 or 50 men disguised as Indians, with paint and gear, had gathered in the back room of a printing office near by, waiting for an agreed signal, and the meeting continued in session till long after dark, waiting Rotch's report. On receiving it, Samuel Adams gave the appointed signal, "This meeting can do nothing more to save the country," and a shout from the porch was answered by a war-whoop from the "Mohawks"; who at once rushed to the wharf followed by a thousand or so of others, and with perhaps a hundred of them boarded the ships, and for three hours worked steadily with hatchets, breaking open the chests and throwing the tea into the harbor. The entire 342 chests on the three ships, valued at about £18,000, were destroyed, without a sound from the mob, which then dispersed. Meantime a fourth tea ship was wrecked off Cape Cod. The immediate result of this was the Boston Port Bill (q.v.); but as the Bostonians had expected, the whole country rallied to their support.

Boston Terrier, a breed of dogs, resembling bull-dogs without their eccentricities, which originated in Boston about 1870, and

soon became popular for its admirable qualities as a companion. This terrier has a shapely bull-dog-like head, and the straight legs and active manners of the old bull-terrier. Those truly bred always have a white muzzle, a white blaze on the face and on the chest and feet, with a fine coat, short and bright, and a deep broad chest. Light-class ones weigh from 15 to 23 pounds, and the heavy from 23 to 30 pounds. This breed arose from a cross between Robert C. Hooper's "Judge" (a dog three quarters English bull and one quarter white terrier, which was a rich dark brindle with a white flare on his face), and Burnett's "Gyp," a pure white bitch low on the legs and stockily built, not unlike the old-fashioned bull-terrier. The product was Wells' "Eph." He was born in Boston about 1870 and was bred to Tobin's "Kate," an old-fashioned bull-terrier, and the result, Barnard's "Tom," may be said to be the first of the real new breed, for he developed the typical screw tail of the present Boston terrier. This dog has a most affectionate disposition, is well knit in build, and is stylish.

Boston University, a co-educational institution of Boston, Mass., organized in 1869. The work is divided into two main departments, the Schools requiring previous college training, and the Colleges requiring no such qualification. The schools are those of theology, law, medicine, and all sciences (for post-graduate work in language, philosophy, history, and science); the colleges are those of Liberal Arts and of Agriculture, the latter allied with the Massachusetts Agricultural College at Amherst. In 1905 the number of students was 1,324, and the number of professors and instructors 148; volumes in the library, 30,000.

Boston, a game of cards played by four persons, with two packs of cards. The cards are never shuffled; one of the packs is dealt, and the other cut alternately to determine the trump, which governs the game. The dealer deals five cards to each player twice, and three the last time around. If the first player can make five tricks, he says, "I go to Boston"; and his competitors may overbid him by saying, "I go 6, 7, 8, 9, 10, 11, 12, or 13," as the hand of each may warrant. Should either of them fail to make the number of tricks he "bids" for, he must pay to each competitor a forfeit regulated by a card of prices, which must be prepared beforehand. Without such a card Boston cannot be played. It is one of the most complicated of games. It is said to have been introduced into France by Dr. Franklin, who gave it the name of his native city.

Boston and Albany Railroad.—The Boston and Albany Railroad as it now exists was formed 28 Dec. 1870, by the consolidation of four railroad companies whose histories respectively are as follows:

The Boston and Worcester Railroad Company, chartered 23 June 1831, built a line between Boston and Worcester, a distance of 44.63 miles, the road being opened to the public 4 July 1835. This company prospered and at the end of eleven years the track between the two cities was paralleled. Branch roads were built to Milbury and Saxonville, to Lower Falls, Milford and Brookline, and to Framington Center, and were opened respectively in 1846, 1847 and 1849.

Meantime, on 15 Feb. 1833, the Western Railroad Company was chartered to build a line from the terminus of the Boston and Worcester road to Springfield, Mass., and thence to some point on the western border of the State. This road was opened to the public in 1841.

The Albany and West Stockbridge Railroad Company was chartered 5 May 1836, to build a line from Albany, N. Y., to the terminus of the Western Railroad Company on the Massachusetts State line, a distance of 39 miles, the company being financed by the Western Railroad Company. The construction of the road was begun two years after the date of its charter and in December, 1840, a section of the road from Albany to Chatham Four Corners was opened. In November, 1841, the Albany and West Stockbridge Railroad Company was leased to the Western Railroad Company for a term of 50 years from April, 1840. Work was now resumed on the remainder of the road, which was completed in September, 1842.

In 1854 interests allied to the Western Railroad Company purchased the Hudson and Boston Railroad, whose line extended from Hudson to the Massachusetts State line, a route parallel to that of the Albany and West Stockbridge Railroad. On account of this latter fact that part of the Hudson and Boston's line lying between Chatham Four Corners and the Massachusetts State line was abandoned.

In September, 1867, the Boston and Albany Railroad was formed by the consolidation of the Boston and Worcester and the Western Railroad Companies. In December, 1870, the new corporation absorbed the leased Albany and West Stockbridge, and consolidated with the Hudson and Boston road, forming the present Boston and Albany Railroad.

In 1866, by purchase of the Grand Junction Railroad the line was extended to East Boston; in 1880 the Springfield and Northern Railroad was purchased and put into operation as the Athol Branch; in 1889 the company bought the Spencer Railway.

The Boston and Albany Railroad is now leased to the New York Central and Hudson River Railroad Company (q.v.), the lease holding good for ninety-nine years from date, 1 July 1900. For this lease the lessee pays an annual rental of two million dollars, equivalent to eight per cent on the capital stock of the leased road.

In addition to this the lessee pays the organization expenses, a sum which at present amounts to \$10,000 per annum; the taxes; the interest on bonds of the leased road; and the rentals which the leased road pays for its leased lines. These lines, leased by the Boston and Albany, comprise the North Brookfield Railroad, the Pittsfield and North Adams Railroad, and the Ware River Railroad.

Boston & Maine Railroad. The Boston & Maine system, as it stands to-day, is one of the most remarkable examples of railroad evolution and consolidation to be found in the world. Including the constituent roads owned, leased, controlled, and operated, it represents fully 125 distinct units, ranging from a four or five-mile line, like the Troy & Bennington, to a great 400-mile "system," like the Fitchburg division. Some of its branches were incorporated as far back as the early thirties, while others are creations of the last 15 or 20 years.

BOSTON AND MAINE RAILROAD

To bring together all of these different and sometimes conflicting transportation units under a single management represents a feat of financing probably unique on this continent. Of the 2,290 miles now operated by the Boston & Maine Railroad no less than 1,665 miles represent roads leased by the parent company. One of these, the Troy & Bennington, is leased in perpetuity, and the lease having the longest term to run is that of the Vermont & Massachusetts road, which expires in 2873. The Massachusetts Valley road lease expires in 2869, the Fitchburg road lease in 1999, and the one to first expire will be that of the Suncook Valley road, in 1912.

To give a clearer idea of the full extent of the Boston & Maine Railroad system the following table, showing the leased roads, with the dates of their incorporation, the beginning and expiration of leases, and mileage has been prepared under the direction of Fourth Vice-President William J. Hobbs:

NAME OF ROAD.	DATE OF INCORPORATION.	DATE OF LEASE.	DATE OF EXPIRATION.	MILES OF ROAD.
Danvers	March 15, 1852	May 30, 1853	May 30, 1953	9.26
Newburyport,				
Danvers & Georgetown.....	May 7, 1851	Feb. 21, 1860	Feb. 21, 1960	26.98

Troy & Bennington.....	March 27, 1851	Oct. 12, 1872	Perpetuity	5.04
Total mileage				1,665.01

While it is impossible to give anything like a complete history of such a complicated system as that of the Boston & Maine Railroad in such a brief sketch as this must be, it is important to note some of the events in its history which stand out most conspicuously. For example, it is certainly worthy of record that the original railroad—the acorn from which the present great Boston & Maine system has sprung—was first conceived in the brain of its founder, Hobart Clark, of Andover, Mass., in the fall of 1832.

Mr. Clark, after traveling over the Albany & Schenectady Railroad, then the only line west of the Hudson river, saw the utility of a branch railroad to Andover, tapping the Boston & Lowell road (then under construction) at Wilmington.

The road was, in 1833, granted a charter under the name of the Andover & Wilmington Railroad, the first directors being Hobart Clark,

Abraham Marland, Amos Abbott, John Smith, and Merrill Pettingill, all residents of Andover. The capital stock was \$100,000.

Hobart Clark was elected president, and the road was surveyed under the direction of Col. Loammi Baldwin, of Charlestown, Mass., the well-known civil engineer.

Work was commenced in the spring of 1835, and the first section of the road was opened to Andover 6 Aug. 1836. By the fall of 1837 it had been opened to the Merrimac river, at Bradford; by 1840 to Exeter; by 1841 to Dover, and by 1843 to South Berwick Junction.

In 1835, a second charter had been obtained allowing the extension of the road to Haverhill, and the name was changed to the Andover & Haverhill Railroad; and a little later in the same year a charter was obtained from the New Hampshire Legislature for a road from the Massachusetts line through New Hampshire to the Maine State line, under the name of the Boston & Maine Railroad.

In the following year the Maine Legislature granted a charter extending the line to Portland, and thus was finally organized the original Boston & Maine Railroad, which to-day serves a very large section, annually transports 40,000,000 passengers and nearly 20,000,000 tons of freight, earns \$35,000,000 a year, owns 17,000 freight cars and 1,200 passenger cars, carries a veritable army upon its payrolls, and operates in five States and one Canadian province.

In addition, the Boston & Maine, through ownership of a majority of the capital stock, also controls the Maine Central Railroad, although that is separately operated.

The system had its beginning in the day of small things, and to-day it exists in an era of great ones, as far as railroad policies are concerned.

The slow but certain process of amalgama-

tion which has resulted in the present vast transportation system under one management has been an exceedingly interesting one, but its history would require too much space to be given even in outline here.

It has been attended by many exciting episodes, legislative and financial, particularly with reference to the leasing of the Connecticut River road in 1893, the Concord & Montreal in 1895, and the Fitchburg in 1900.

These leases were hotly contested by minority stockholders or opposing interests, but most of the leased lines were absorbed without much show of opposition.

It has for some time been the policy of the company to purchase outright its leased lines, whenever that has been practicable.

In view of the present highly-organized condition of railroad operation it is noteworthy that when the original Boston & Maine road was first built and operated the telegraph had not been invented and double tracks were essential for the safe operation of trains.

Moreover, civil engineering was then in its infancy and surveying instruments were clumsy and primitive, the transit not even having been produced at that time.

Few of those who were engaged in building the road had ever had any experience in such work, for railroads themselves were very new then, and there is a tradition that fully 75 per cent of the surveying for the line was done without instruments and by purely visual work. There were no time fuses to aid in blasting, and not even friction matches had come into existence.

Aside from the relocation of a part of the Central Massachusetts division, made necessary by the construction of the great Wachusett reservoir, the only considerable piece of railroad in the territory now controlled by the Boston & Maine which has ever been actually abandoned was part of the original Portsmouth & Concord road. This line once ran between Suncook and Candia, and that portion of it was afterward given up for a more favorable location.

According to the latest financial report issued by the company—that for the year ending 30 June 1905—the total earnings of the road during the previous 12 months were \$36,213,245. Deducting operating expenses, \$26,619,740, left the net earnings, \$9,593,505, an amount that was further increased to \$10,181,093, by the addition of \$587,588, which represented the road's income from other sources.

EDWARD O. WOODWARD,
Conveyancer, B. & M. R. R.

Bostonians, The, a novel of American life, by Henry James, published in 1886. Written in a satirical vein, it presents with unpleasant fidelity a strong-minded Boston woman possessed by a "mission," "who takes life hard," is never so happy as when struggling, striving, suffering in a cause which throughout the novel is the emancipation of women.

Boswell, James, English writer: b. 29 Oct. 1740; d. 19 May 1795. He was the son of a Scotch judge, Lord Auchinleck, who took this title from the name of his estate. He was educated at Edinburgh and at Glasgow, and early displayed literary tastes. In 1763, when on a visit to London, he was introduced to Johnson, and though this first meeting was not

very hopeful for the future, a warm friendship soon sprung up between them. During a year spent on the Continent, he made the acquaintance of Voltaire, Rousseau, and other prominent men of the day. Returning in 1766 he was admitted an advocate, but the practice of his profession was little to his taste. In 1768 he published a history of Corsica, with a lively account of his own experiences in the island. The same year he again met Johnson in London, and his intercourse with him was kept up by many subsequent visits to the metropolis; while Johnson himself came to Scotland in 1773, when the pair made their famous journey to the Hebrides. This year also Boswell became a member of the famous Literary Club, with various members of which, such as Burke and Reynolds, he was on terms of intimacy. In 1769 he had married, but he continued mainly dependent on his father till the latter's death in 1782, when he succeeded to the estate. In 1784 he met Johnson for the last time at a dinner at Sir Joshua Reynolds'. Two years after (1786) came out his 'Journal of a Tour to the Hebrides with Samuel Johnson, LL.D.' (Johnson's own account of the tour had appeared in 1775). Having latterly been admitted to the English bar, he went on circuit and held for a year or two the recordership of Carlisle; and from 1788 onward he mostly resided in London. In 1791 appeared his 'Life of Johnson,' a work which he had been long preparing, and which at once gave readers the same delight as it has ever since inspired. A second and enlarged edition came out in 1793. By this time Boswell's health had greatly suffered from his too convivial habits, and he died in London having been a widower since 1790. Boswell was a singular compound of sense and folly, of genuine ability and foible bordering on craziness. His good nature was universally admitted; his vanity and want of self-respect and self-control were his most evident faults. His weaknesses were easily seen, but the man who enjoyed the sincere affection of Dr. Johnson and the enduring friendship of Burke and Reynolds had better stuff in him than appeared to the superficial observer. His life of Johnson is such a masterly performance as only a genius for life-portraiture could have produced. Among editions of the Life may be mentioned that of Croker (10 vols.) and those of Rev. A. Napier (Bohn's Standard Library, 6 vols.), and Dr. Birkbeck Hill (Clarendon Press, 6 vols.), all containing the Tour. See Macaulay's essay, and the much more humane and penetrating essay by Carlyle. Boswell left two sons. The elder, ALEXANDER, born in 1775, succeeded to the family estate, sat for a year or two in Parliament, and was created a baronet in 1821. He wrote several well-known Scottish songs and various other things in verse and prose, and also set up a private press from which issued reprints of rare old works in the Auchinleck library. In 1822 he met his death in a duel with a Mr. Stuart, against whom he had made some severe attacks in a political journal. JAMES, the second son, born in 1779, died in 1822, was the editor of an improved edition of Malone's Shakspeare, generally known as the 'Variorum Shakspeare' (21 vols. 1821).

Bosworth, Francke Huntington, physician: b. Marietta, Ohio, 25 Jan. 1843. He was educated at Yale and Bellevue Hospital Medical

colleges. He is professor of diseases of the throat in Bellevue, consulting physician to the Presbyterian and St. Vincent's hospitals, and an authority on diseases of the nose and throat. Publications: 'Manual of Diseases of the Throat and Nose' (1881); 'A Study of Nasal Catarrh' (1882); 'Growths in the Nasal Passages'; 'The Three Tonsils'; 'Treatise on the Diseases of the Nose and Throat'; 'Malignant Disease of the Upper Air Tract'; 'Taking Cold'; 'Text-Book of Diseases of the Nose and Throat.'

Bosworth, Joseph, English philologist: b. Derbyshire, 1789; d. 27 May 1876. He was educated at Repton, Aberdeen, and Trinity College, and was ordained deacon in 1814, and after filling several livings in England was British chaplain at Amsterdam and Rotterdam for 12 years. He devoted much time to researches in Anglo-Saxon and its cognate dialects, the result of his studies appearing from time to time. His chief works are his 'Anglo-Saxon Grammar; Dictionary of the Anglo-Saxon Language; and Compendious Anglo-Saxon and English Dictionary.' In 1857 he was presented to the rectory of Water Shelford, Buckingham, and next year was appointed Rawlinson professor of Anglo-Saxon at Oxford, a post which he held till his death. He was M.A. and LL.D. of Aberdeen; Ph.D. of Leyden, and D.D. of Cambridge. In 1867 he gave \$50,000 to establish a professorship of Anglo-Saxon at Cambridge. He left a certain amount of materials that he had accumulated for a new edition of his larger Anglo-Saxon Dictionary, and these have been utilized and greatly added to by Prof. Toller of Manchester in the copious Dictionary which has been published under his editorship by the Clarendon Press.

Bosworth, or Market-Bosworth, England, a small town in the county of Leicester, about three miles from which is Bosworth Field, where was fought, in 1485, the memorable battle between Richard III. and the Earl of Richmond, afterward Henry VII. This battle, in which Richard lost his life, put a period to the long and bloody Wars of the Roses, between the houses of York and Lancaster.

Bot-fly. In these flies, so interesting in their habits, the body is stout, hairy, like the humblebees, and they are easily recognized by having the opening of the mouth very small, with rudimentary oral organs. The middle part of the face is exceedingly narrow, and the minute antennæ are inserted in rounded pits. The eggs hatch very soon after laying, and Riley thought, from the testimony of three independent witnesses, that the sheep bot-fly is viviparous, the larvæ hatching within the body of the parent, who deposits in the nostrils of the sheep the perfectly formed and living grub.

The larvæ are, in general, thick, fleshy, footless grubs, consisting of 11 segments exclusive of the head, which are spined and tuberculated, the former in rows, which enable them to move about readily when living under the skin or in the frontal sinus, and thus greatly irritate the animals on which they live. The stigmata are placed in a scaly plate on the thickened posterior end of the body. The mouth of the cutaneous larvæ consists simply of fleshy tubercles, while in those species that live in the stomach and frontal sinuses of their hosts, it is provided with

horny hooks. While in this state they moult twice, and then attain their full size. They feed on the purulent matter originating from the irritation produced by the movements of their bodies. Just before assuming the pupa state, the larva leaves its peculiar habitat, descends into the ground, and there becomes a coarctate pupa (see PUPA).

Besides the horse bot-fly (q.v.), the ox bot-fly (q.v.) and the sheep bot-fly (q.v.), there is included in the genus *Dermatobia* the "ver macaque" of Cayenne and Mexico, which is found beneath the skin of man in tropical America. It is disputed whether it be a true indigenous (*Cestrus hominis*," or one that originally attacks the monkey, dog, or other mammal. In Cayenne the species attacking man is called the "ver macaque"; in Eastern Brazil (Para) "ura"; in Costa Rica, "torcel"; in Colombia, "gusano peludo," or "muche." The "ver moyocuil" (*D. noxialis*) lives on the dog, sheep, cattle, and man; and is found in Mexico and New Granada. The larvæ are long, cylindrical, S-shaped, differing greatly in form from others of this family. The flies are closely allied to those of the preceding genus.

Leidy states that several specimens of the larva of a bot-fly were obtained in Honduras (by Le Conte). They were usually found beneath the skin of various parts of the body, and the eggs were suspected to have been introduced while the persons were bathing. The men were not aware of the circumstance, and the presence of the larva gave them comparatively little uneasiness. According to Kreff, a species of *Batrachomyia* is parasitic upon four species of Australian frogs. The larvæ are found between the skin and the flesh behind the tympanum. When they quit the frog the latter dies. The change to the pupa state is usually effected on the lower surface of a piece of rock in some damp locality. The perfect insect emerges in 32 days. Consult: Packard, 'Guide to Study of Insects' (1889); Brauer, 'Monographie der Oestriden' (Vienna 1863); Osborn, 'Insects Affecting Domestic Animals' (1896).

Botallack, a mine on the west coast of Cornwall, England, eight miles north of Land's End. The works are on the edge of the cliff; part of the underground workings (abandoned in 1875) extended 2,448 feet beneath the sea. The mine has been wrought for both tin and copper.

Botanical Gardens. The term botanical garden is used to designate a limited area of ground on which is grown a collection of plants including a large number of species brought together to subserve scientific, educational, æsthetic, or economic purposes. In the broadest sense, it is a museum of plants, and one of its chief ends is to represent, by means of living specimens so far as possible, the principal types of vegetation of the earth. It is impossible to cultivate more than a few thousand species on any given area under the natural conditions of soil and climate, and the open-air plantations are generally supplemented by collections grown under shelter, in glass houses, and in specially prepared soils. It has been found practicable to grow in this manner as many as 12,000 or 15,000 species of the higher plants in the botanical gardens at St. Louis and New York, at Kew, England, and at Berlin, Germany. A

BOTANICAL GARDENS

proper selection of this number may be made to represent somewhat fairly the principal forms of plants, which include about 250,000 species. That is to say, it is possible to grow in one place about one species out of every 17 in existence.

Living plants cultivated in the open air are most suitably arranged in plantations according to their general habit, and in such manner as to show their general relationships. Then special groups are often made of certain families, such as the conifers, the willows and poplars, the grasses, ferns, or mosses. The most common arrangement of plantations includes the herbaceous grounds, the aquatic plants, alpinum, viticetum, fruticetum, arboretum, and economic plantations. Some institutions bring together collections for the purpose of illustrating the local flora, or the flora of any given geographical district.

The herbaceous plantations are intended to include the representatives of small soft-bodied plants which die down to the soil during the winter or resting season, and which may or may not have a perennial underground stem-formation of some kind. Many of the species are annuals and must be grown from seeds every year.

The pools for aquatic plants are arranged to afford suitable means for the culture of forms which float or root in ponds and streams of fresh water, and include a wide variety, such as the water-lily, pondweeds, *Philotria*, water-hyacinth, etc.

An alpinum is a special plantation generally arranged to afford means of cultivation of species from cold climates on mountain-tops or in higher latitudes. Plantations of this kind are often termed rockeries, and are in the form of a ridge or hill covered with boulders. In such plantations precautions must be taken to give lime-loving plants a place among limestone rocks, and with the necessary low temperatures.

The viticetum is a plantation devoted to the cultivation of climbing and trailing vines, and may take almost any form demanded by the exigencies of practical gardening. Among the necessary features are trellises or supports for twining and tendrill climbing forms.

The fruticetum includes all woody perennial plants which do not form a central trunk six feet in height, and which are therefore not trees. These are most effectively grouped when the individuals of the separate species are placed in the ground separately in a scheme of general arrangement by which every plant may be inspected from all sides and is unshaded by its neighbors.

The arboretum includes trees, and these may be variously arranged, singly or in groups, always with respect to their mutual relationships. On account of their great size and comparatively slow growth and greater permanency, the placing of trees in any given landscape scheme in a garden is attended to with the greatest care.

The economic plantations may include useful plants arranged according to their relationships, and grouped according to the use or nature of the derivative. Thus a division may be made in which only species used for medicine, foods, or clothing are included, or a division may be made to include plants which yield starches, oils, gums, and resins.

Special plantations of selected families must

depend for their constituency upon the location of the garden. Thus it would be possible to form a collection of palms in a tropical garden, and one of pines or willows in a temperate climate. Geographical plantations may take any given district by variously arranged plantations.

Still another group of plantations is being made in some gardens to illustrate types of habit and structure. Some of the principal groups to be illustrated in this manner are parasites, which draw nourishment from the living bodies of other organs; saprophytes, which live on decaying organic matter; xerophytes, plants adapted to living under the driest conditions; plants with structures serving as a protection against animals. Forms of propagation and reproduction, methods of dissemination of spores and seeds, etc., also serve as subjects to be illustrated by separate groups.

The collections grown under shelter and in conservatories are generally grouped in such manner that species are partly assembled with regard to their climatic requirements, and partly according to their relationships. Thus a house may be devoted to tropical plants, or to temperate plants, or may contain only orchids, palms, ferns, cacti or succulents, or other special groups.

The part of the vegetable kingdom which may not be cultivated may be represented in a museum by dried specimens, material in preserving-fluids, and dissections of various kinds. Here again the arrangement may be upon the basis of natural relationship, or upon the basis of economic usefulness. The species which formed the vegetation of the previous geological periods are represented by fossil specimens, completing the history of the plant-world so far as it is known, and yielding suggestions as to the descent of the present types.

Two general educational purposes are served by an institution of this character. Its collections are arranged to present information on the form, relationship, mode of life, habit, and general biological character of the principal types of vegetation, in such manner as to be capable of comprehension by persons unacquainted with the technical aspects of the subject. Further interpretation of such facts may be made by means of books, journals, lectures, etc., devoted to this branch of work and study.

The material accumulated for the exploitation of popular knowledge of plants also affords an excellent basis for the induction of students into the more strictly scientific aspects of botany; and when such material is supplemented by laboratories furnished with apparatus, microscopes, and other instruments of precision, the activities of these students may be carried beyond the frontiers of the subject into the investigation and discovery of new facts and phenomena. This extension of the boundaries of knowledge concerning the plant-world may be carried on to advantage only when a library is at hand containing all of the more important literature bearing upon the subject.

Botanical gardens owe their origin to the needs of medical science, in accordance with which species showing valuable medical properties were grown in convenient places.

The first authentic record of the introduction of medicinal plants into cultivated plots of ground dates no farther back than the time of

the elder Pliny (23–79 A. D.), who writes of the garden Antonius Castor, at Rome, in which were grown a large number of medicinal plants. This step, however, may have been taken much earlier by the Greeks, Chinese, or Mexicans. Later the Benedictine monks of northern Italy paid great attention to the growing of remedial herbs, and devoted an important proportion of the monastery gardens to this purpose. This practice was also carried beyond the Alps, and in 1020 a garden was in existence at the monastery of St. Gall, in Switzerland, not far from Lake Constance, which contained 16 plots occupied by medicinal plants. A garden of this character was founded 1309 at Salerno, and another at Venice 1330.

The 16th and 17th centuries witnessed the foundation of many gardens in England, France, Germany, Holland, and Sweden, some of which have had a continuous existence to this day. The garden of Bologna was founded 1568; Leyden, 1577; Leipsic, 1579; Montpellier, 1596; Paris, 1597. The last-named was organized for the determination of "what variations were possible in the style of bouquets worn at the royal courts." Then followed the establishment of the gardens at Giessen, 1605; Strasburg, 1620; Jena, 1629; Oxford, 1632; Upsala, 1667; Chelsea, 1680.

The number of these institutions at the present time is nearly 300, only a few of which, however, are devoted to the more important purposes named above. Many botanical gardens are merely municipal parks in which some attempt is made to exhibit special groups of plants, and are devoted chiefly to floriculture. Others are almost entirely experiment stations for the exhibition and testing of economic species, while still others find their chief usefulness as an aid in teaching botany in schools and colleges.

D. T. MACDOUGAL,
*Director of Laboratories,
New York Botanical Garden.*

Botanical Geography. See DISTRIBUTION OF PLANTS.

Botany is that branch of biology, or the science of living organisms, which deals with plants, and is thus distinguished from zoology, which deals with animals. An individual plant, considered as a living or once living organism, may be studied in two ways—with reference to its structure or with reference to its functions. These represent the two great subdivisions of pure botanical science—*anatomy* and *physiology* respectively. All other phases of botanical science are special developments of one of these two, either alone or in combination with the other, or in relation additionally to some other branch of knowledge. *Anatomy* and *physiology* are thus the primary elements, as it were, of botany, which in varying combinations with each other and with the elements of other sciences constitute the branches of botanical science actually in existence, such as *taxonomy*, *ecology*, *cytology*, and *pathology*. The term *plant anatomy* is restricted frequently in actual use to *gross anatomy* and is often called *structural botany*. In this sense is covered about as much of the whole of anatomy as can be studied by the unaided eye or with a lens. *Minute anatomy*, or *histology*, covers the minute structure of plants,

the principal instrument in its study being the compound microscope. A study of the relationships of plants on the basis of anatomical resemblances constitutes comparative anatomy, or morphology. The classification of plants, known as *taxonomy* or *systematic botany*, is in the main a specialized branch of morphology, for the principal means by which plants may be grouped so as to indicate their genetic relationship is a comparison of their structural differences and resemblances. In its actual study *plant physiology* is closely associated with *plant histology* because most of the functions of the plant are intimately connected with the structure of plant cells, and the physiologist must of necessity understand these structures. A special branch of botanical research which has to do with the complex structure and activities of the plant cell is known as *plant cytology*. The study of the diseases of plants, whether they are due to fungi or other plant organisms, or are purely physiological, is *plant pathology*, sometimes called *vegetable pathology*.

History.—Among the ancients, Aristotle the Greek philosopher (384 to 322 B.C.), Theophrastus his pupil (about 372 to 287 B.C.), the Roman naturalist Pliny the Elder (23 to 79 A.D.), and the Greek physician Dioscorides (of the 1st or 2d century A.D.) left botanical records of historical interest, but botany as a modern science has developed in the last four centuries, dating from the Reformation. The writing, particularly by the Germans, of herbals, or treatises on economic and medicinal plants, and the founding of botanical gardens, occupied most of the 16th century, but in the year 1583 Cesalpino, an Italian physician, published the first formal and comprehensive classification of plants. This, though artificial, formed the basis of all generally recognized classification to and including the time of Linnæus in the latter part of the 18th century. The 17th century was chiefly notable for advances not in the classification of plants, but in their structure and vital processes. Malpighi, an Italian, and Grew, an Englishman, almost simultaneously published their researches on the gross anatomy and the cellular structure of plants, the first of which were presented in 1671. To the work of these men in plant anatomy little of importance was added in more than a hundred years. The other important discovery of the century was the demonstration by Camerarius in 1691, through direct experiment, of the sexuality of plants. The 18th century was marked especially by advances in classification. In the year 1700 Tournefort published his 'Institutiones,' in which for the first time genera were systematically named and described. During this century Linnæus, the great botanical compiler and systematizer, brought out his successive works, culminating in the 'Species Plantarum,' in 1753. It was later in the same century, too, that botanical exploration came to be recognized as an important department of the voyages of geographic and scientific discovery in which the nations of Europe became engaged. In 1789 A. L. de Jussieu published his 'Genera Plantarum,' in which was first systematically formulated a comprehensive classification of plants according to their natural relationship, as opposed to the artificial systems followed by Cesalpino and Linnæus. In the last two decades of this century were laid the foundations of our present know-

ledge of the important part played by the air in the nutrition of plants, a proper conception of which was possible only in the light of the new developments which took place at that time in chemistry. The 19th century witnessed enormous strides in plant anatomy and plant physiology, the latter largely contributed to by workers in chemistry and physics, and the former rendered possible by improvements of the compound microscope and accessory instruments, especially those which came into general use about 1840. From this movement has been derived most of our knowledge of the life history and relationship of the lower groups of plants, the fungi, algæ, and lichens, and the assignment of the pines and their relatives to their true position next above the ferns. The whole realm of botanical research was profoundly affected by the work of Darwin, beginning with the publication of his 'Descent of Man,' in 1858, which gave a new point of view for all subsequent work. In systematic botany the principle of the development of species from a common ancestor was substituted for the old view of the constancy of species. The remarkable adaptations for cross fertilization in the coloration, odor, and structure of flowers was given its true and significant explanation as a means for originating and perpetuating species. Darwin's work gave a new philosophical basis for the interpretation of observed phenomena and facts.

Progress in the United States.—At the beginning of the 19th century the advancement of botany in North America was largely in the hands of physicians, through their requirement of a knowledge of plants as *materia medica*. Professors of botany were unknown. Linnæus and other great botanists in Europe had had American correspondents, and geographic expeditions accompanied by European botanical collectors had touched the margins of the continent. Some botanical exploration, chiefly by European visitors, had been effected east of the Alleghany Mountains. The centre of botanical activity was at Philadelphia, among the members of the American Philosophical Society. With Lewis and Clark's expedition across the continent to the mouth of the Columbia, in 1803-6, began a series of American explorations of the great interior, directed first to the Louisiana Purchase, then to Oregon, and finally to California. These were supplemented on the north by the British expeditions of Sir John Franklin and others in quest of a Northwest Passage. In the fifties began the Pacific Railroad surveys and these were followed by the geological surveys. All these contributed materials for the discovery, description, and orderly arrangement of the North American flora, the collections going largely into the hands of Thomas Nuttall at Harvard University, John Torrey at Columbia, Asa Gray, who was Nuttall's successor, and George Engelmann, a physician of St. Louis. Meanwhile appeared a new factor which was destined to play an important part in the development of botanical science in America, the establishment of agricultural colleges in the late sixties. These institutions created a demand for a class of botanists who did not exist in the United States or anywhere else, botanists who had brought a critical scientific training to bear on the hard problems of agriculture. For the succeeding two decades the universities of the country, including some of the agricultural colleges them-

selves, were busily engaged in educating the required men, a movement which resulted in the preparation of many who were competent not only to act as teachers of botany in the agricultural colleges but, a still more important matter, to act as investigators in agricultural experiment stations, one of which was established in each of the States and Territories in the late eighties. The branch of botany which received its greatest impulse was pathology, the science of the diseases of plants. Plant pathology has already been carried to a point of high scientific development and practical application attained in no other country. Systematic, or, as it is now more commonly known, taxonomic, botany has made rapid strides forward in the past two decades, largely through the application of methods developed and perfected by American ornithologists. These methods differ from others chiefly in a full consideration of the geographic relationships of plants and the examination of very large series of specimens. A new revision of the whole North American flora along these lines and accompanied by systematic botanical exploration is now under way. For the future two lines of inquiry are likely to be conspicuous in American botany, first, the principles of heredity in plants and the applied phase of the subject, plant breeding on a scientific basis; and second, the correlation of plant functions with plant structures, a work which will have far-reaching importance in broadening our understanding of the processes of nature. The geographic location of American botanical research has undergone a profound change as a result of the Spanish-American war. The area to which up to that time the energies of American botanists had been chiefly directed was the north temperate belt of one hemisphere, but they now must deal in addition with botanical problems in the tropics of both the New World and the Old World.

Classification.—The plant kingdom is divisible into five great groups, the *Myxophyta*, or slime molds; the *Thallophyta*, including the bacteria, algæ, fungi, and lichens; the *Bryophyta*, including the liverworts and mosses; the *Pteridophyta*, including the ferns and their allies; and the *Spermatophyta*, or flowering plants. The first four of these are often jointly designated as the *Cryptogamæ*, or cryptogams, in contradistinction to the *Phanerogamæ*, an older name for the flowering plants.

The *Myxophyta*, or slime molds, known also as the *Myxomycetes*, *Mycetozoa*, and *Myxothallophyta*, are organisms which though usually treated as belonging to the vegetable rather than the animal kingdom, have no cellulose walls covering the cells of which they are composed; pass a part of their life as plasmodia, or masses of naked creeping protoplasm similar to the animals known as amoebæ; and are reproduced without even the simplest method of sexual regeneration. Most of them resemble fungi in that they grow upon decayed animal or vegetable matter. The *Thallophyta* include a wide variety of plants, associated with each other by exclusion, on the one hand, from the animal-like *Myxophyta*, and, on the other, from the *Bryophyta* and higher plants. The plant body is commonly not differentiated into stem and leaf, and may even be unicellular; a cell wall is usually present; chlorophyll is often wanting; and frequently sexual reproduction does not ex-

ist. Among the important groups belonging to the *Thallophyta* are the *Schizomycetes*, or bacteria; the *Schizophyceæ*, or bluegreen algae; the *Euphyceæ*, or true algae, including the diatoms, desmids, green algae, stoneworts, brown algae, and red algae; the *Eumycetes*, or true fungi; and the *Lichenes*, or lichens. The *Bryophyta*, or liverworts and mosses, are small plants, having in their life cycle a sexual generation in which the sexual organs are borne on a plant body usually differentiated into stem and leaves, followed by a non-sexual generation, which consists of a stalked or sometimes sessile spore-bearing capsule remaining attached to the plant body of the preceding generation. The female organ of reproduction consists of an oosphere in a sac called an archegonium, the walls of which are made up of many cells, much more complex structurally than the female organ of the *Thallophyta*. The male organ consists of motile antherozoids produced from an antheridium. The group consists of the *Hepaticæ*, or liverworts, some of which have a flat scale-like body called a thallus, and of the *Musci*, or mosses. The *Pteridophyta*, represented by the ferns, resemble the *Bryophyta* in their sexual organs, but differ in the possession of what is known as vascular, as opposed to merely cellular, tissues, and also in that the asexual generation becomes a large plant and maintains a separate existence independent of the earlier generation. The group includes, besides the true ferns, the grape-ferns, jointrushes, clubmosses, quillworts, and a few others. The *Spermatophyta*, or flowering plants, also known as *Anthophyta* or *Phanerogamæ*, find their essential difference from the *Pteridophyta*, not in the production of flowers, but in the relationship of the sexual and the asexual generations and in the character of the sexual organs and their embryonic product. In an ordinary fern the sexual generation is a small flat green organism, resembling a thallose liverwort, growing on the ground or other substratum and deriving its nourishment from it, but in the *Spermatophyta* the sexual generation is reduced to almost microscopic dimensions, and leads no independent existence but is enclosed within the body of the non-sexual generation, the male portion consisting of the pollen grain and the tube that grows out of it when the pollen grain germinates, the female portion consisting of a minute cellular structure within the embryo sac of the ovule. It is to be noted that no motile bodies are produced, as in the two preceding groups, and that the fertilization of the ovule results in the development of an embryonic plant called a seed, which is produced by none of the lower groups of plants. The *Spermatophyta* are divided into two groups, of which the lower is the *Gymnospermæ*, including the cycads, the cone-bearing trees, and a few related families. In these the ovules are borne not in ovaries but naked among the floral bracts, and the sexual generation of the female is still comparatively complex before fertilization and bears considerable resemblance to that of some *Pteridophyta*. In the other group, the *Angiospermæ*, the ovules are borne in ovaries, and only the simplest remnant of a sexual generation persists. In this group are the *Monocotyledones*, including the grasses, palms, lilies, orchids and their relatives, and the *Dicotyledones*, including the great majority of flower-

ing plants. The dicotyledonous and the gymnospermous plants were at one time classed as a group *Exogenæ*, in contradistinction to the group *Endogenæ*, which consisted of the monocotyledonous plants. This grouping of the flowering plants into exogens and endogens, however, is no longer maintained, it having been shown from embryological studies that the gymnosperms should stand next above the ferns. The old division of dicotyledonous plants into *Apetalæ*, *Gamopetalæ*, and *Polypetalæ* is also now discarded, the families included under *Apetalæ* appearing not to constitute a real group. They have therefore been interpolated among the families of the remaining two groups, most of them going with the *Polypetalæ*. All three of the old names have been abandoned, the name *Archichlamydeæ* being now used for the apetalous and polypetalous plants jointly, and the name *Sympetalæ* for the gamopetalous plants. The known species of plants as based on recent standard and conservative enumerations of the various large groups are approximately as follows:

<i>Myxophyta</i>	400
<i>Thallophyta</i>	59,000
<i>Bryophyta</i>	8,000
<i>Pteridophyta</i>	3,500
<i>Spermatophyta</i>	120,000

	190,900

Plants in Relation to Geology.—Plants play an important part in the configuration of the earth's surface by the prevention or retardation of erosion. This is accomplished by the direct binding action of roots on the soil, by obstructing the run-off of water as it filters through a layer of decaying vegetable matter, and by hindering the melting of snow under the shade of a forest cover. Wind erosion of sand or dust soils both on beaches and in arid regions is prevented chiefly by vegetation. In the building up of peat deposits, such as the sphagnum bogs of the Northern States, or the Dismal Swamp, Okefinokee Swamp, or the Everglades, plants are the principal factors. Deposits of coal and petroleum are of vegetable origin. The disintegration of rocks is hastened by the presence of living mosses and other plants. The fertility of soils is largely dependent on the admixture of decayed vegetable matter, or humus; and the so-called nitrifying organisms of the soil, which change nitrates, which can not be taken up as food by plants, to nitrites, which are readily absorbed, belong to a group of microscopic plants known as bacteria. A very important role in soil fertilization is played by a certain group of plants, the *Leguminosæ*, including the clovers, beans, and peas. One of the essentials of plant food is nitrogen. Ordinary plants have not the power to take free nitrogen from the air, where it exists in almost unlimited quantities, but absorb their nitrogen from certain nitrogenous substances in the soil. This element of soil fertility is soon exhausted. Leguminous plants, however, produce on their roots small tubercles containing bacteria which have the power to take free nitrogen from the air in the soil and put it into a form suitable for plant food. By the death and rotting of the plant the nitrogen thus absorbed from the air is incorporated in the soil and is available as food

for all sorts of vegetation. In this way the leguminous plants are almost indispensable for the rehabilitation of soils worn out by excessive cropping.

Plants in Relation to Geography.—Most of the land surface of the earth is covered by a green mantle of vegetation, which varies in its makeup at different points in accordance with several factors, the most general of which in its variation is temperature. Certain areas of the north polar and south polar regions, permanently or almost permanently covered with snow or ice, and various similarly cold areas on mountains of higher and higher elevation in lower latitudes, are devoid of vegetation. Next to this is an area of sufficient warmth in summer to produce a vegetation of herbaceous plants and shrubs but devoid of trees—the arctic, antarctic, and alpine vegetation. Then come the temperate areas of the earth, characterized by a vegetative covering able to withstand freezing during a portion of the year, yet sufficiently warm to permit an abundant growth of trees. Next follows the tropical area, with a vegetation not subjected to frost and characterized especially by forests made up in part of palms. A factor of probably even greater importance, but more broken and restricted in its distribution, is moisture. The four great temperature categories outlined above are cross-hatched by moisture lines parallel with the lines of equal precipitation. With too little moisture forests can not exist, and we have plains and deserts of grass or brush. Neither do forests exist in a soil too persistently moist and poorly drained, and thus we have moors, bogs, natural meadows, and savannas. The extreme of moisture is reached in the plants called aquatics, growing either in fresh water or in the ocean, often wholly submerged.

Each of the other factors in plant growth, light, air, food, and the complex mechanical relations of the plant, varies greatly from one locality to another, and in their various combinations with different degrees of heat and moisture they furnish an almost endless variety of environments. Each of these combinations of conditions has its characteristic association of plants, which, adapted to the conditions, and to each other, form a community. The study of plants in their detailed relation to these local surroundings forms a branch of geographic botany known as plant ecology. North America furnishes a good series of geographic areas with sufficient climatic differences to necessitate different floras. The vegetation of the continent is divided by Merriam into the following zones: Arctic, Boreal, Transition, Upper Austral, Lower Austral, Tropical. The Arctic zone extends from northern Labrador northwestward across the northern edge of the continent to Bering Strait, dipping southward along the shores of Bering Sea to Bristol Bay, Alaska. The vegetation of this zone consists of herbaceous or of depressed woody plants, trees being absent. Over large areas, known as tundra, the ground is permanently frozen underneath, a few inches of the surface thawing each summer and permitting the growth, in a cold, wet soil, of an often luxuriant but low vegetation. The Arctic zone is represented southward as far as southern California and northern Arizona by certain alpine plants on the summits of mountains high enough to have a timber line, approximately 12,000 feet in that latitude. The Boreal zone, sometimes

subdivided into a northern, or Hudsonian, belt and a more southerly, or Canadian, belt, extends from the Arctic zone southward to a line traversing the northern part of New England, Ontario, Michigan, and Minnesota, jumping to the higher elevations of the Adirondack and Appalachian Mountain systems, then continuing westward across North Dakota and Assiniboia to British Columbia, dipping south in the higher elevations of the Rocky Mountains nearly to Mexico, in the Cascades and Sierra Nevada to southern California, and along the shores of the Pacific to northern California. The most characteristic feature of this zone is forests of spruce or balsam fir. The Transition zone covers most of New England, New York, Michigan, Minnesota, North Dakota, about half of South Dakota, and the southern part of Assiniboia, thence extending southward through the Plateau and Great Basin to Arizona, New Mexico, and California, in the southern parts of those States reaching down to an elevation of about 6,000 feet. The most characteristic tree of the eastern, humid part of this zone is the white pine; of the western, arid part, the yellow pine. The Upper Austral zone, as represented in the eastern United States by the so-called Carolinian flora, covers the lower Hudson valley, southern New Jersey, Delaware, eastern Maryland, the Piedmont section of the south Atlantic States, middle Tennessee and Kentucky, and most of Ohio, Indiana, Illinois, Iowa, and Missouri, northwestern Arkansas, southeastern South Dakota, and eastern Nebraska and Kansas. It is especially characterized by its forests of certain species of oak and hickory. The flora of the western part of this zone, known as the Upper Sonoran, covers the principal part of the arid western plains, from Washington and Montana southward through the Mexican plateau. The flora is devoid of trees and is commonly characterized by sagebrush or bunchgrass. The Lower Austral zone is divided, like the last, into an eastern humid and a western arid part. The eastern, containing the Austroriparian flora, covers the coastal plain from Chesapeake Bay to middle Texas, extending northward in the Mississippi valley to extreme southern Illinois and Indiana. One of the most characteristic wild plants is the cane, while cotton is the most conspicuous cultivated plant. In the arid region of western Texas, the great valleys of New Mexico, and the deserts of southwestern Arizona, southern Nevada, and southeastern California, lies the western part of the Lower Austral zone, containing the flora known as the Lower Sonoran, characterized especially by the creosote bush and the mesquite. This flora has large extensions into northern Mexico. The Tropical zone covers the lower third of the Florida peninsula, enters the extreme southern point of Texas, and on the Pacific coast reaches north on the east side of the Gulf of California to the lower Colorado and Gila rivers. From these northern extremes the tropical flora extends southward through Mexico, Central America, and the West Indies. Various genera and species of palms form the most conspicuous and characteristic features of this flora.

Plants in Their Economic Relation to Man.—Every savage race is intimately associated with the flora of its region. Having no means by which to supply the ordinary necessities of life through foreign trade, as do many civilized

races, the savage has learned from necessity to know the precise qualities of the plants about him as foods, textiles, poisons, dyes, tans, fuels, etc. In connection with the making of a single aboriginal instrument, such as a bow or a fire-drill and block, there is required on the part of the savage a knowledge of the strength, elasticity, texture, and other qualities of all the kinds of wood occurring in the range of his travels, such as is not possessed by one person in a thousand among highly civilized races. The economic value of a correct and discriminating record of the uses of plants among aboriginal peoples is evident. The influence of a familiar flora in attracting a savage race to a wider geographic range or that of a strange flora in limiting migration in any direction is a natural outcome of the savage's exact knowledge of the plants of his native region. The practice of some of the migratory races of prehistoric man to transport their cultivated plants with them has resulted in the wide extension of these plants from the regions they naturally occupied. From this association it turns out that a critical study of the origin and distribution of the plants cultivated by aboriginal races throws important light on their prehistoric migrations. Some of these botanical facts appear to be of very great antiquity, perhaps even antedating those furnished by aboriginal arts or by language. This study of the relation of primitive man to his plant environment is called ethnobotany, or aboriginal botany. Some of the processes of plant life are important to man as being fundamental to his existence. The plant is an engine which through the energy furnished by sunlight is capable of transforming inorganic substances into organic compounds, without which animal life could not exist. The ordinary economic relations of plants to civilized man are many, and enter as important factors into such arts and industries as agriculture, horticulture, medicine, manufacture, and commerce. The production and elaboration of plant products and their transportation from those parts of the world in which they can be and are produced to other parts in which they are needed occupies probably the largest part of the energies of the human race.

FREDERICK V. COVILLE,

Chief Botanist, U. S. Dept. of Agriculture.

Botany Bay, New South Wales, Australia, so called by Capt. Cook on account of the many strange plants found growing here. Cook landed in Botany Bay on his first voyage in 1770, and took possession of the country in the name of his sovereign. The penal settlement, founded in 1788, and popularly known by the name of Botany Bay, was established on Port Jackson, where the town of Sydney now stands.

Botany Bay Gum, a gum resin produced by the *Xanthorrhoea hastilis*, or *resinifera*, of Australia.

Botargo, a relish made of the salted roe of the mullet or tunny, used on the Mediterranean coasts.

Botetourt, Norborne Berkeley, a conspicuous actor in American colonial history: b. England, 1734 (?); d. Williamsburg, Va., 15 Oct. 1770. He was the descendant of John Berkeley, the cavalier, who was ennobled by Charles II. in 1660. He was sent to Virginia as royal governor in 1768, just eight years before the Declaration of Independence. He had full instructions from the Crown and directions to assume more dignity than had been the wont of colonial governors, and accordingly he paraded the streets of Williamsburg with guards, a coach, and other requisites of vice-regal pomp. Conflicting duties to the king and the people made his situation most unpleasant. In 1769 the assembly took into consideration the incipient troubles with England, and on 16 May passed firm but respectful resolutions remonstrating against parliamentary taxation and the right claimed to send them to England for trial. So firm were they that Lord Botetourt summoned the speaker and burgesses before him and dissolved them. The result was that a convention met in a private house and took the incipient steps for the revolution. The convention did not attempt to legislate, but simply remonstrated with Parliament, sending its resolutions to the other colonies and to England. Under the influence of these resolutions Lord Hillsborough wrote a letter to Lord Botetourt, assuring him that it was not the intention of government to tax the colonies, and that the obnoxious imposts would be withdrawn, which letter Lord Botetourt communicated to the assembly. All these anticipations, however, were destroyed by the policy of Lord North, who succeeded Charles Townsend, and the promise was not fulfilled in full, the duty on tea being retained. Botetourt was deeply mortified, and soon died of disease aggravated by mental suffering. He was deplored by men of all classes in the colony, and the legislature erected a marble statue to his memory, which is still standing in the college of William and Mary.

Both, John and Andrew, two Flemish painters, were born at Utrecht about the year 1610, Andrew being the younger. They were the sons of a glass painter, who instructed them in the rudiments of drawing. They afterward made further progress in the school of Abraham Bloemaert, and went at an early age together to France and Italy. John, attracted by the works of Claude Lorraine, chose him for his model; Andrew preferred the painting of the human figure, and imitated the style of Bamboccio. But although their inclinations led them in different directions, their fraternal affection often united their talents in the same works. Thus Andrew painted the figures in the landscapes of his brother; and their labors harmonized so well, that their pictures could not be suspected of coming from different hands. The ease and fine coloring in the beautiful figures of John cannot be overlooked in spite of the excess of yellow sometimes found in them. Andrew was drowned at Venice in 1650. John, inconsolable for his loss, abandoned Italy, and returned to Utrecht, where he died shortly after.

Botha, Christian, Boer commander: b. the Transvaal; d. Kokstad, Griqualand West, 8

Oct. 1902. At the opening of the Boer war in 1899 he led a commando into Natal and was active in the siege of Ladysmith and at the defense of the Tugela crossing. After the relief of Ladysmith, he retreated to Laing's Neck, where he was left by his brother, Louis Botha, in command of the Boer forces. By opening negotiations with Gen. Buller he delayed that general's advance for several days, and after the fall of Pretoria he was placed in command of all the Boer forces in the southeastern Transvaal. His frequent raids into Zululand effected the diversion that allowed Gens. Louis Botha and De Wet to continue the war.

Botha, Louis, Boer soldier: b. Greytown, Natal, about 1864. He began life as a farmer, and, as a young man, had a share in the establishment of the Transvaal Republic. Later he fought in the Kaffir campaign. He was elected to the Volksraad at Pretoria. Upon the outbreak of the Boer war with England in 1899 he was given a subordinate command, and upon the death of Gen. Joubert in March 1900 he became commander-in-chief of the Boer forces. He demonstrated great capacity by his victories at Spion Kop and Colenso.

Bothie (Gael. *bothag*, a cot), a house, usually of one room, for the accommodation of a number of work people engaged in the same employment; especially, a house of this kind in parts of Scotland, in which a number of unmarried male or female farm servants or laborers are lodged in connection with a farm. Bothies are most common in the northeast of Scotland, and are chiefly for the accommodation of unmarried male farm servants engaged on the larger farms, who as a rule have to do their cooking and keep the bothie in order for themselves. The bothie system has often been condemned.

Bothnia, the name formerly given to a country of northern Europe, extending along the east and west shores of the Gulf of Bothnia, the east portion now being comprised in Finland, and the west in Sweden.

Bothnia, Gulf of, the northern part of the Baltic Sea, which separates Sweden from Finland. It commences at the island of Åland, lat. 60° N., and extends to 66°; its length is about 450 miles, its breadth from 90 to 130, and its depth usually from 20 to 50 fathoms. As its water contains little salt, it freezes over in the winter, so as to be passed by sledges and carriages. It abounds in salmon and other fish, and also in seals.

Bothriocephalus, a genus of cestoid worms which is found very abundantly in the intestines of predaceous fishes, and one species of which is sometimes found in the intestinal canal of man. It belongs to the same family as the tapeworm (*Tania solium*), but it is distinguished from it by having its segments broader than they are long; by wanting the four disks which surround the head of the tapeworm, and having in their place two lateral longitudinal openings; and thirdly, by having the sexual organs on one of the flat surfaces of each segment instead of at the edges of the segments. The two longitudinal openings (whence the worm receives its name, from *bothrion*, a little pit, and *kephalē*, the head) do not seem to be organs of nutrition, but merely a kind of suckers by which

the worm is enabled to attach itself to the intestines of the animal which it infests, while it is nourished by absorption throughout its whole length. Although, as already stated, this worm generally infests the bodies of predaceous fishes, it is capable of being transmitted to all vertebrate animals, and especially it is found in those birds which live upon fish. The only species which is found in the intestines of man is the *Bothriocephalus latus*, and it is rare to find even this species except among the inhabitants of two distinct parts of Europe, the north and the centre. It is found, on the one hand, in Russia, in Norway, and in Sweden, and on the other hand, in Switzerland, the north of Italy, some provinces of Germany, and some departments of France, but rarely elsewhere. It has been remarked that this worm is common where the *Tenia* or true tapeworm is rare, and *vice versa*. It is rare in the United States, but with the increase of emigration from the regions of Europe, where it abounds, its appearance may be looked for.

Bothwell, James Hepburn, Earl of, is known in Scottish history by his marriage to Queen Mary. He was the only son of the third earl: b. about 1536; d. 1578. He succeeded his father in 1556, thus obtaining important offices and estates, and by 1566 he had attained to high favor with the queen. The plot by which Darnley lost his life in 1567 was of his contrivance, and the queen was suspected of conniving at it. Bothwell was charged with the crime and underwent a mock trial, being of course acquitted. After the death of Darnley he seized the queen near Edinburgh, and carrying her a prisoner to Dunbar Castle, prevailed upon her to marry him. Before this he had divorced his own wife, Jean Gordon, sister of the Earl of Huntly. Though seemingly secure in the possession of power, and though created Duke of Orkney by the unfortunate queen, he soon found that his conduct had roused the indignation of the kingdom. A confederacy was formed against him by the barons, the queen was liberated from his power, and he escaped to the Orkneys, and afterward to Norway. The Danish authorities kept him imprisoned for some time at Malmö, latterly at Drangholm in Zealand, where he died insane. See the various histories of Scotland, and the 'Life of Bothwell' by Prof. Schiern (English translation 1880).

Bothwell, Scotland, a village of Lanarkshire, on the north bank of the Clyde. It is situated eight miles east of Glasgow, and about one mile beyond it stands Bothwell bridge, where a decisive battle was fought in 1679 between the Scottish Covenanters, commanded principally by their clergy, and the royal forces, commanded by the Duke of Monmouth, in which the former were totally routed. Near the village are the fine ruins of Bothwell Castle, once a stronghold of the Douglasses.

Botocodos, or **Aymores**, a Brazilian race of Indians. They live 70 to 90 miles from the Atlantic, in the virgin forests of the coast range (Serra do Mar or Serra dos Aymores), on the borders of the forests of Minas-Geraes and Espirito-Santo, especially on the Rio Doce. They receive their name from the custom which they have of cutting a slit in their under lip and in the lobes of their ears, and inserting in these, by way of ornament, pieces of wood shaped like

the bung of a barrel (Portuguese *botoque*). They have oblique eyes and projecting cheekbones. Their color is a dirty brown. They go quite naked, and paint their bodies, and a Botocudo warrior with his lip and ear plugs, his body painted black and red, and his face bright red, strongly reminds one of a denizen of the infernal regions. They are very skilful with the bow and arrow, and live chiefly by hunting. They now number only a few thousands, and are decreasing.

Botrychium, a genus of fern (adder's-tongue), of the sub-order *Osmundea* and tribe *Ophioglossa*, characterized by its distinct *theca* in a compound spike attached to a pinnate or bipinnate frond. The common American species are: *B. lunaria*, common moonwort, which grows on elevated lands and pastures where other ferns are seldom found. It was once supposed to possess great virtues, both magical and medicinal, and was carefully gathered by the light of the moon. *B. virginicum*, the largest of the species, is known by the name of rattlesnake fern, from growing in places frequented by that dangerous reptile.

Botrytis, a genus of fungi belonging to the section Hypomycetes, and familiar by name to cultivators from its connection with the potato disease. The genus contains a number of those minute plants known as molds and mildews, and of these some have the peculiar habit of growing in the tissues of living vegetables. The threads of which their growth consists creep among the loose cells of the under side of leaves, and send up their fertile shoots through the stomata. Many kinds of *Botrytis* are extremely destructive to various plants. Whole crops of onions are soon destroyed by one species; legumes suffer from another, but in a less degree; and a third species is sometimes injurious to turnips. The decay of the leaves and stem in the potato disease is now charged against *Phytophthora infestans*, but old writers attributed the trouble to *B. infestans*. Though extremely injurious to the farmer these molds are sometimes very serviceable by destroying weeds. Various agricultural pests may often be seen looking yellow and unhealthy, when an examination of the under side of the leaves will show that this is owing to the ravages of these minute parasites.

Botta, Anne Charlotte Lynch, American author: b. Bennington, Vt., 1820; d. 28 March 1891. She was educated in Albany, N. Y.; began her literary career in Providence, R. I., and, removing to New York, married Prof. Vincenzo Botta, in 1855. From the time of her marriage to her death, her house was a favorite centre of literary and art circles. Her publications included a collection of poems, many essays, reviews and criticisms, and 'A Handbook of Universal Literature.' She was a sculptor of much merit, and was influential in promoting the establishment of Barnard College for Women.

Botta, Carlo Giuseppe Guglielmo, Italian statesman, historian, and poet: b. San Giorgio del Canavese in Piedmont, 6 Nov. 1766; d. Paris, 10 Aug. 1837. During the time of the French Revolution he was a student of medicine at Turin, and adopting revolutionary opinions with enthusiasm, he suffered for his zeal by 'two years' imprisonment (1792-4). After pass-

ing as a physician he entered the French service, and accompanied the expedition which Napoleon sent to Corfu, and he was soon after elected as a member of the provisional government of Piedmont. When this territory was, in 1803, annexed to the French empire, Botta was elected a member of the Corps Législatif, where his behavior was characterized by a bold opposition to the emperor. During the "Hundred Days" he was rector of the academy at Nancy, and after the second return of the Bourbons he went in a like capacity to Rouen. The greater part of the remainder of his life was passed by him as a private gentleman at Paris. His chief works belong to the department of history. Among these are: 'Storia della Guerra dell' indipendenza degli Stati Uniti d'America'; 'Storia d'Italia dal 1789 al 1814' (10 vols.). He also furnished a continuation to Guicciardini's Italian History from 1490-1534, bringing it down to 1789.

Botta, Paul Emile, French traveler and archæologist: b. about the beginning of the 19th century; d. Poissy, April 1870. He was a son of Carlo Giuseppe Botta (q.v.). While still very young he made a voyage round the world, traversed the western portion of America, and took part as physician to Mehemed Ali in an expedition which set out from Egypt to Sennaar, of which he took advantage to make a considerable zoological collection. At a later period he was appointed French consul at Alexandria, and from this place he undertook a journey to Arabia in 1837, the scientific results of which he communicated to the world in his 'Relation d'un Voyage dans l'Yémen.' His chief service to science consists in his having discovered the ruins of ancient Nineveh, a discovery made by him in 1843 in the course of excavations in the neighborhood of Mosul, which he conducted with great energy and ability while acting as consular agent for the French government at that town. As the result of investigations made upon the spot he published two important works, one on the cuneiform writing of the Assyrians, 'Mémoire de l'Ecriture Cunéiforme Assyrienne,' and the other upon the monuments of Nineveh, 'Monuments de Ninive' (5 vols. folio, with drawings by Fløndin, Paris). The latter is a work of great splendor, and marks an era in Assyrian antiquities. From 1847 to 1857 Botta lived as French consul-general in Jerusalem, and from 1857 to the end of his life in the same capacity at Tripoli.

Botta, Vincenzo, Italian scholar: b. in Piedmont, 11 Nov. 1818; d. 5 Oct. 1894. He was elected to the Sardinian parliament in 1849. In 1853 he settled in the United States and was appointed professor of the Italian language and literature in the University of New York. He published 'Dante,' 'Modern Philosophy in Italy,' and other studies.

Bottari, Giovanni Gaetano, Roman Catholic prelate: b. Florence, 1689; d. 1775. After completing his studies he was admitted a member of the Academy della Crusca, and entrusted with the preparation of the celebrated dictionary of that body. He labored for six years on this work, which was published in 6 volumes folio. The ability which he displayed in it induced the Duke of Tuscany to give him the management of the grand-ducal printing office. He left Florence in 1730 and settled in Rome, where

Pope Clement XII. appointed him professor of ecclesiastical history and polemics in the Collegio della Sapienza; the same year he was appointed palatine prelate. Shortly after he was employed with the geometer Manfredi in examining the course of the Tiber from Perugia to the mouth of the Nova, with the view of rendering it navigable, and providing a remedy against its devastating inundations. The excellent report on the subject, though signed by Manfredi, is said to have been drawn up by Bottari. As a compensation for the performance of this task, the Pope appointed him keeper of the Vatican library. After living under several Popes, all of whom treated him with favor, he died at the age of 86. His works, in addition to those already mentioned, are partly original and partly corrected editions of celebrated writings previously published. Among the former are 'Lectures on Boccaccio, Livy, and Dante'; among the latter is a splendid edition of Virgil, with a learned preface and notes, and a corrected edition of Vasari's 'Lives of the Painters.'

Bottesini, Giovanni, Italian musician: b. Crema, Italy, 24 Dec. 1822; d. 7 July 1889. He was taught the double-bass in Milan, by Luigi Rossi, according to the method of Andreoli and Dragonetti, and soon became a first rate performer; meanwhile studying musical composition under several distinguished masters. When scarcely 23, he was engaged as contrabassist for the Italian opera in Havana, where in a few seasons he rose to the post of *maestro* and musical director of the company. Here he produced in 1846 his first opera, 'Cristoforo Colombo.' During the five years of his stay in Havana, he paid occasional visits to the United States, where he secured considerable fame by his wonderful performances in the concert room. His masterly handling of the huge instrument took everybody by surprise, while his style, at once elegant and impressive, won the admiration of all critics and amateurs. His success on his return to Europe in 1851 was not less complete; the concerts he gave in London and Paris established his reputation as the first living contrabassist. In 1853 he returned to the United States with M. Julien, and afterward accompanied Madame Sontag to Mexico. Subsequently he became director of the orchestra at the Italian opera in Paris, where his opera 'L'Assedio di Firenze' was successfully performed during the spring of 1856. Other works are: 'Ali Baba' (1871); 'Ero e Leandro' (1879); 'Garden of Olivet' (1887), an oratorio. He also published numerous overtures, symphonies, and quartettes.

Böttger, or Böttcher, also written **Böttiger, Johann Friedrich**: b. Schleitz about 1681; d. Dresden 13 March 1719. He was a Saxon alchemist whose pretended discovery of the philosopher's stone resulted in the useful invention of Saxon porcelain. After various vicissitudes he handed over to King Augustus II. an account of his discovery, which is still preserved in the archives of Saxony. The king, however, not availing himself of his suggestions, they were put in application by Count Tschirnhausen, who established a manufactory at Weissen in 1705, employing Böttger, who succeeded in producing of the reddish-brown clay which abounds in the vicinity of Weissen a porcelain of remarkable beauty and solidity.

Botticelli, Alessandro Filipepi, ã-lës-sân'-drô fil-i-pã'pë bôt-te-chêl'lê, Italian painter of distinction commonly called Sandro Botticelli: b. Florence 1447; d. there, 17 May 1510 or 1515. His name is derived from that of Botticello, his first master, a goldsmith, from whom he acquired his knowledge of gold afterward made useful by his employment of it in foliage, hair, and embroidered tissues. He subsequently became one of the most distinguished pupils of Filippo Lippi, the Carmelite, and is reckoned the richest and most fanciful colorist of the Florentine school. He excelled both in devotional and mythological subjects and was an admirable painter of flowers. He was employed by the most influential art patrons of his time, including Lorenzo de Medici. About 1481 he was commissioned by Sixtus IV. to paint the walls of the Sistine Chapel; three of the frescoes there are his work: 'The Life of the Muses'; 'The Temptation of Christ'; 'The Punishment of Korah, Dathan, and Abiram,' and several of the portraits of the Popes. He became an ardent follower of Savonarola, and is said latterly to have neglected his art and suffered many privations. He is said to be one of the engravers of a celebrated series of illustrations executed by Florentine artists toward the close of the 15th century, notably a set of designs for the 'Divina Commedia' of Dante, of which 686 are in the Berlin Museum. His works are to be found in various European galleries, his Madonnas being especially characteristic of his style. In these the Virgin appears peculiarly slender and with a melancholy expression as if oppressed by forebodings. He was greatly esteemed by his contemporaries, but subsequently fell into disfavor. Although opinions as to his merits differ widely, Botticelli is to-day very popular and forms the theme of much art discussion. See Ulmann, 'Sandro Botticelli' (1893); Pater, 'Studies in the History of the Renaissance' (1873); Phillimore, 'Botticelli' (1894); Berenson, 'Florentine Painters of the Renaissance' (1898); Supino, 'Sandro Botticelli' (1900); Steinman, 'Botticelli' (English translation 1901).

Böttiger, Karl August, German writer, particularly distinguished as an archæologist: b. Reichenbach, Saxony, 8 June 1760; d. Dresden, 17 Nov. 1835. After a philological course at Leipsic, he became in the first place a private tutor at Dresden, and then successively headmaster of a school at Guben, and another at Bautzen. In 1791, through the influence of Herder, he became director of the gymnasium at Weimar, and it was here that, while he enjoyed the society of Goethe, Schiller, Wieland, and other distinguished men, he began his fruitful literary career. In 1804 he removed to Dresden, where he devoted himself exclusively to archæology. Ten years later he was appointed chief inspector of the Museum of Antiquities in that city, where he continued to reside to the end of his life. In 1832 he became a member of the French Institute. Among his most important works are: 'Sabina, or Morning Scenes of a Wealthy Roman Lady'; 'Griechische Vasengemälde' ('Paintings on Greek Vases'); 'Thoughts on the Archæology of Painting'; 'Mythology of Art'; 'Lectures and Essays on Archæology'; 'Amalthea' (3 vols.).

BOTTICELLI.
Nymph and Centaur.

BOTTLE—BOTTLING

Bottle, a vessel designed to hold liquids, constructed of various materials and in various forms according to the necessities of local manufacture and the demands of the kind of liquid to be enclosed. It is now understood to mean a vessel made of glass, with a more or less narrow neck and mouth. In ancient times, however, the bottle was nothing more than a skin of some animal. Thus the Biblical aphorism concerning the putting of new wine into old bottles as an illustration of folly means that it would not be wise to trust a new wine, while yet active with fermentation, to the chance of bursting a leathern vessel necessarily weakened by use and age. In Spain, Turkey, India, and some parts of South America to this day, various skins, and especially that of the goat, are used for containing wine and water. The hide is stripped from the animal as entire as possible, and the various natural openings having been sewed up, with the exception of that of one of the legs, which is retained as a nozzle, the vessel is ready, after a certain preliminary curing of the skin, for the reception of the wine. The peculiar taste of Amontillado sherry is supposed to be owing to the fact of its being kept in leather. The ordinary bottle is, however, of glass. The various bottles used for different well-known purposes are generally distinguished by peculiar shapes and sizes, as, for example, the English wine, beer, ale, and soda bottles, the French champagne, Burgundy, and claret, and the Rhenish wine bottles. Port wine is occasionally put into very large bottles, called magnums, and acids in still larger ones termed carboys.

Bottle Charts, maps of the terminal points of the voyages of sealed bottles thrown into the sea, and either drifting to land or picked up afloat. These bottles had long been used by the victims of ship-wreck to convey messages or record their fate, or by travelers or seamen for joke or experiment; but the first serious note taken of them was by Lieut. Becher of the British navy, who in 1843 published in the 'Nautical Magazine' a Mercator chart of the Atlantic coast from lat. 6° S. to 63° N., or say from Cape St. Roque, in Brazil, to Hudson Strait, with straight lines from start to finish of a number of bottle voyages he had noted, the length of these lines, time elapsed since set afloat, etc. Of course some bottles leak and founder and others are crushed; but he was able to collect 119 bottles, one of which had traveled 3,900 miles in a straight line, and of course far more in fact, and 4 over 2,000, while the time of voyage varied from 3 days to 16 years. This chart has been repeatedly freshened up with new facts, re-engraved, and republished in the 'Nautical Magazine.' Later, several government departments, of which the United States Hydrographic Office is far the chief, have used this method systematically for the study of ocean currents. The office furnishes shipmasters with papers for inclusion in bottles, containing requests in several different languages for their delivery, with date and circumstances of finding, to the nearest United States consul, who will forward them to Washington. By this means three or four hundred new bottle voyages have been registered, with curious results. In general, their track is remarkably uniform, given the same local conditions. Of two bottles thrown out from the

Blonde within five days in 1826 (one of Becher's list), one was picked up 14 and the other 16 years after at the same spot on the French coast. Yet the effect of local winds is so great that of two set afloat simultaneously at the same spot, one was picked up on the Shetlands, the other on the west coast of France. Just north of the Azores, the surface conditions are so variable that of five bottles thrown out in one summer within 100 square miles, one drifted to the coast of Norway, two to the west coast of Ireland, one to France, and one to Spain. The longest recorded voyage was about 8,500 miles, from the Allertons, south of the Falkland Islands, to the shore of the great Australian Bight, in a little less than three years. See CHART; MAP.

Bottle-gourd. See CALABASH.

Bottle-tree, a medium-sized Australian tree (*Sterculia rupestris*) of the natural order *Sterculiaceae*. From the top of the globular stem, as from the mouth of a bottle, the branches extend. They bear lanceolate leaves two to four inches long, and axillary panicles of inconspicuous flowers followed by leathery six-seeded follicles. The soft brittle wood is of little economic value, but the stems are said to contain much water, which is frequently obtained by the natives and by travelers. Some other allied species, also called bottle-tree, furnish edible mucilaginous roots which are largely used by the aborigines.

Bottlenose, or **Bottlehead**, a small Arctic and North Atlantic whale (*Hyperoodon rostratus*) closely allied to the sperm whale, and so called from the dolphin-like shape of its head or snout, where the two pointed teeth are in the lower jaw. Placed farther back than ordinarily, and in smaller proportion, is a dorsal fin; the skin is smooth, and glossy, lead-colored on the back, graduating into white on the belly. These whales travel in small bands, generally keeping just south of the Arctic ice, and moving northward during the breeding season. They feed mainly on deep-water squids, for which they dive to great depths. Their chief value lies in the amount of oil and spermaceti that they yield.

Bottling, the process of enclosing liquids in bottles; including the operation of stopping or corking. The use of bottles for retaining liquids involves three requisites: that they shall be clean enough not to injure the purity, taste, or looks of the contents, or the looks of the bottle, or to cause chemical action which will do so; shall be strong enough to resist the probable pressure; and shall have stoppers which will not be disintegrated or corroded, and will be tight enough not to let air in or volatile substances out, the degree of such precaution varying with the liquid. For scientific preparations, which includes chemical analysis in criminal cases, an indispensable condition is that the bottle shall contain no impurities which would cast doubt on the result; hence chemists in such cases use only new bottles, cleanse them thoroughly with some preparation to remove external substances, and expose them to a red heat before using. For common household use, as there is no bottling under pressure, the kind or weight of glass is of no importance. For cleaning, it is best to shake up with warm water and caustic soda and clean with a bottle-

BOTTOM—BOTTOMRY

brush; to clean out gummy residues like paraffine from naphtha and gasoline bottles, shake up with sulphuric acid.

The material of the stopper is of the first importance. For scientific use, only glass is possible; as also to retain corrosive acids, and perfumes that would pass through the pores of a cork, in which latter case also nice taste as well as security is a desideratum. In general family use, for volatile fluids like gasoline and naphtha, and ammonia which might soak up and disintegrate the cork and let its gas escape, rubber is the usual stopper. In commercial bottling on a large scale, of beer, wine, mineral waters, and carbonated beverages generally, the only stoppers used are cork and rubber, except in the case of siphons with valves. For wine, the old-fashioned long cork, driven deep in and pulled with a corkscrew, still holds the field. The common stopper for "soft" drinks, and in part for beer, is a "terraced" rubber one fastened to the under side of an iron cap, and attached to the neck of the bottle by a wire loop whose leverage forces the rubber tightly into the mouth of it, and can be easily thrown off and the stopper removed. But in the United States, for beer even the rubber stopper is rapidly being displaced by a patent cork made in Baltimore, consisting of a crimped metal cap lined with cork, which a machine tightens around the neck of the bottle. It is easily lifted off by an iron ring, thrown over the neck and pulled up by a short handle; is much cheaper than the permanent rubber, and nearly as handy; and is cleaner, as good houses use only new ones. Indeed the use of old corks recleaned belongs to a low grade of goods. For milk bottles and others of which the corks are to last but a few hours, and need no strength, pasteboard or wood-pulp are much used.

Old bottles, however, are used over and over; and here thorough cleanliness is a prime requisite, both for salability and because dregs of old liquor might ferment and ruin the new. If any corks have been driven in, they are extracted by machinery; for the rest, in the large establishments, the bottles are placed in rows of pockets on the surface of a large drum, which their weight, as the upper rows are added and the emerging ones taken off, causes to revolve slowly through a vat of hot solution of caustic soda, which enters the open mouths and eats out the sticky remnants of the last filling. They are then taken out and placed by sets, inverted, in a frame over revolving brushes, now consisting almost entirely of two or three rubber prongs held apart by strings or centrifugal force,—the old bristle brushes being disused because they wear out and leave bristles in the bottles,—at a speed of from 2,500 to 3,000 times a minute; then rinsed in frames of from two to four dozen vertical sprinkling tubes, over which the bottles are set, and jets of hot water forced into them. The filling is done by siphonage, or air or gas pressure. A simple form for small breweries is an open trough filled from a barrel, and supplying several siphon tubes which the operator starts by sucking them, shifting the bottles as fast as filled; the siphon is tilted up by the weight of the bottle enough to give a flow, and the liquid in the trough is kept at a constant level by a float. But in the larger ones, a row of barrels or hogsheads is drawn upon by a set of rubber pipes with stop-cocks, to which the bot-

tles are held and filled by means of air or gas pressure, one pipe having several branches. With carbonated beverages there is danger of the bottles bursting, and they are filled in iron cages open only at the top, to protect the workmen; with heavily charged waters in siphons, the latter are of tougher glass and are tested beforehand, and the men sometimes wear rubber coverings for face, hands, or body. With flavored or sweetened drinks, the sirup is fed into the bottle from one spout while the carbonated water comes from another; in small works, however, the sirup is put in first and the bottle filled right-side up.

The recrimping of patent corks has been described; the old-fashioned long corks are shaped by a compressor and driven into the bottles by a plunger, operated either by hand or foot, or a self-feeder which can do 2,000 an hour. The corks are previously thrown into a hollow revolving drum for several hours, to rub against and batter each other, which knocks off the loose chips and shakes out the dust; then soaked and rinsed. There are wiring machines for either the small wires over the long corks, or the hinged wires with the rubber stoppers. The bottles when filled and corked are labeled by a machine, usually the bottles being laid in a crib with expansible sides, and a plunger forcing them down against the label, which at the same time is picked up and moved under the bottle across a paste roll; sometimes the label is pressed against the bottle. The speed of this process is practically limited only by the ability of the workman to feed bottles to the machine. A special label is sometimes fitted over the cork, for security against refilling the bottles of a reputed firm with inferior liquors. Sometimes the corks have a stamp or brand burnt into them with a hot die pressed down by a machine. Finally, the corks are often covered with tin-foil or caps of some kind; the former is done by hand.

Much capital is invested in this business, and there is a national association composed of manufacturers. Returns are made by nearly all these firms and companies to the association, from which it appears that this industry employs nearly 30,000 persons; it serves 4,489,038 customers, owns 22,940 horses, employs a capital of nearly \$51,000,000, and owns bottles to the value of \$12,747,633. Its loss of bottles annually is \$3,522,804. In this line are consumed annually, besides bottles, corks in great number, wire, patented arrangements for closing bottles, paper boxes for holding bottles, sealing wax, and labels. The cost of these materials is given at \$7,937,001. The capacity of corking-machines reaches 2,000 bottles per hour; that of labelling-machines 12,000 bottles daily.

Bot'tomry is the hypothecation or pledge of a vessel for the payment of a debt. The creditor has no right to take possession of the ship until the expiration of the time for which the loan is made, and then (under a bottomry contract in the usual form) only by the intervention of an admiralty court. If the loan is not repaid at the stipulated time, the lender applies to an admiralty court, which (the truth of the claim being established) decrees a sale of the ship to satisfy the debt. The conditions of such a contract usually are that, if the ship is not lost or destroyed by those risks which the

lender agrees to run, the debt is to become absolute. The risks assumed by the lender are usually the same as are enumerated in a common policy of insurance. If the ship is wholly lost in consequence of these risks, the lender loses his loan. In case of a partial damage, the bottomry bond usually provides that this damage shall be borne by the lender in the proportion of the amount loaned to the value of the ship. If this amount is equal to half the value of the ship, the lender is to bear half the amount of such loss, etc. As the lender thus assumes a certain risk he is justly entitled to a greater interest than if he did not thus take the hazard of the loss of the whole loan; and this is called "marine interest." He is entitled to the usual rate of interest on his loan, in addition to the usual premium of insurance for the same voyage or period. The stipulation for such a rate of marine interest is not a violation of the laws against usury, for it is not merely a compensation for the use of the money lent, but also for the risk assumed. The ship-owner may borrow money on bottomry whether his vessel be in port or at sea. But the captain of the ship, as such, cannot so borrow when in the port where the owner resides, or near enough to consult him on any emergency. In any other port he may pledge the ship on bottomry for the purpose of raising money necessary for repairing, supplying, and navigating her, if he can obtain it in no other way. If he borrow thus without necessity the bond is void, and the lender can look only to the personal responsibility of the captain.

Botts, John Minor, American legislator: b. Dumfries, Va., 16 Sept. 1802; d. Culpeper, Va., 7 Jan. 1869. He studied law and in 1833 entered the Virginia legislature. He was elected to Congress in 1839 and was frequently re-elected. Upon the outbreak of the Civil War he asserted his devotion to the Union, and in 1862 he suffered imprisonment on that account. After the war he published 'The Great Rebellion, Its Secret History, Rise, Progress, and Disastrous Failure'; was one of Jefferson Davis' bondsmen; and attended the Convention of Southern Loyalists in Philadelphia.

Botulism, bôt'û-lîsm, a form of poisoning due to the eating of tainted sausages, ham, head-cheese, or other impure meats. As a rule a certain stage of decomposition has taken place in the meat. Bacteria are abundant and generate toxins, some of which are responsible for the symptoms, which are those of acute gastrointestinal irritation. There is usually a period of from 12 to 24 hours (even 48 hours) after the eating of the meat before symptoms develop. The symptoms are various; there may be intense muscular weakness, with sudden nausea and vomiting; chills, small rapid pulse, cold extremities, headache, and pain are also present. Following the chilly sensations the temperature may rise, even to 103° or 104° F. Cramps, delirium, hallucinations, diarrhoea, and intense prostration may also be present. In some sudden and severe cases death has resulted with cholera-like symptoms. Recovery is very protracted. Many of the cases resemble internal hemorrhage, and great difficulty sometimes exists in the diagnosis. There are, however, more intestinal symptoms as a rule in meat poisoning (ptomaine poisoning). Abstaining from

all tainted meats is the sole preventive. See POISONS.

Boturini Benaduci, bôt-û-rě'ně bā-nā-doo'-chē, **Lorenzo**, Italian antiquarian: b., Milan about 1702; d. Madrid about 1750. In 1736 he went to Mexico and traveled there among the Indians, collecting a large number of their writings and valuable Spanish records; these finally came into the possession of the Mexican government and have been mostly lost or destroyed. He afterward lived in Spain, where he held the office of historiographer for the Indies. He wrote 'Idea de Una Nueva Historia de America.'

Bot'zen, or **Bolzano**, bôl-tzā'nō, Austria, a town in the Tyrol, 54 miles south of Innsbruck, at the confluence of the Talfer with the Eisack. It is a well-built, flourishing town, surrounded by a wall two miles in length, built to protect it from a mountain torrent close by. The parish church is a Gothic building of the 14th century, with an elegant spire; adjoining it is the new cemetery. The other objects worthy of notice are: the church of St. Nicholas, a gymnasium, custom-house, two monasteries, a normal school, and a nunnery. It has some silk and woolen manufactures, tanneries, dye-works, etc. Botzen has an important transit trade, and has four annual fairs, resorted to by commercial travelers from all parts of Italy and Germany. In the environs wine and fruits are produced. Pop. about 12,000.

Bouch, bowch, **Sir Thomas**, English civil engineer: b. Thursley, Cumberland, 22 Feb. 1822; d. Moffat, 30 May 1880. He was early attracted to engineering studies, and in 1839 began his apprenticeship to a civil engineer in the north of England. He was a resident engineer on the Stockton & D. Ry. for a period of four years, and in 1849 went to Scotland as manager and engineer of the Edinburgh & Northern Ry. While in the service of this company he devised a sort of floating railway for carrying goods trains across such estuaries as those of the Forth and Tay. After this he was for a time engaged in railway construction in England. He was engineer of the first railway bridge across the Tay, which was completed in September 1877, and opened in May of the following year. For this he received the freedom of Dundee, and in 1879 the honor of knighthood. On 28 December of that year the bridge gave way during a stormy night, while a train with some 70 passengers was crossing. All were drowned, and the accident caused such severe mental distress to Sir Thomas Bouch that it undoubtedly hastened his death.

Bouchardon, Edmé, ăd-mā boosh-ăr-dôn, French sculptor: b. Chaumont-en-Bassigny, 1608; d. Paris, 27 July 1762. In order to devote himself to statuary he went to Paris and entered the school of the younger Coustou. He soon gained the highest prize, and was made royal pensioner at Rome. The Duke d'Antin recalled him to Paris and gave him a studio at the Louvre. He assisted in repairing the fountain of Neptune at Versailles, and executed 10 statues which adorn the church of St. Sulpice. The fountain in the Rue de Grenelle, which the city of Paris ordered to be constructed in 1739, was made by him, and is considered his masterpiece. The execution of the greatest monument of that period, the equestrian statue of Louis

XV., which was erected by order of the city of Paris, was committed to him. He labored 12 years on this with inconceivable perseverance, and has left in the horse a model which may be ranked with any work of antiquity. His pieces bear the character of simple grandeur, but, in general, more fire is to be desired in his sculpture. Latterly he adopted a more polished, delicate manner, to suit the taste of the age. Caylus has written his life.

Boucher, boo-shā, Alfred, French sculptor: b. Bouy-sur-Orvin, 1850. He studied under Dumont and Paul Dubois. His statues include 'Venus Astarte' and 'At the End,' both bought by the French government for the Luxembourg Gardens; 'Eve After the Fall'; 'The Earth'; and 'A Sleeping Woman.'

Boucher, François, frän-swä, French painter: b. Paris, 29 Sept. 1703; d. 30 May 1770. While a pupil of the celebrated Lemoine he gained at the age of 19 the first prize of the Academy. He produced with remarkable facility, and his sketches alone amounted to more than 10,000. He also etched some plates, and many of his paintings have been engraved. Some of his more important works are: 'L'Aurore et Céphale'; 'Diane Sortant du Bain'; 'Femme Couchée'; 'Le But'; 'Le Repos en Egypte'; etc. He was a director of the Academy of Painters.

Boucher, bow'-chèr, Jonathan, English clergyman: b. Cumberland, 12 March 1738; d. Epsom, 27 April 1804. He came to Virginia about 1754; officiated first as private teacher, and, after receiving episcopal ordination in England, as rector in Virginia and Maryland until 1775, when he returned to his native country, his anti-revolutionary sentiments having given umbrage to his American congregation. From 1784 to the time of his death he officiated as vicar of Epsom, Surrey. He is the author of a glossary of provincial and archæological words, which was intended by him as a supplement to Dr. Johnson's dictionary. In 1799 he published 2 assize sermons, and 15 sermons which he had delivered during his ministry in America, and which treated of the American Revolution. These he dedicated to Washington; they are interesting from the political anecdotes which they contain.

Boucher, Pierre, pē-ār boo-shā, French pioneer in America: b. Perche, France, 1622; d. Boucherville, Canada, 20 April 1717. He came to Canada in 1635, took part in an Indian war, and was sent to France in 1660 as a deputy for the colony of New France. He was later made governor of Three Rivers. He wrote 'A True History of the Customs and Products of New France.'

Boucher de Crèvecœur de Perthes, Jacques, zhāk boo-shā dè krāv-kér-dè pārt, French anthropologist: b. Réthel, 10 Sept. 1788; d. Abbeville, 5 Aug. 1868. Through his father, an active botanist, he came under the notice of Napoleon, and was employed in numerous missions to Italy, Germany, Austria, and Hungary. After the Restoration he lived at Abbeville. He wrote travels, poems, and an early apology for free trade: but only his works on the archæology of man are of consequence now. The first, 'On the Creation' (5 vols. 1839-41), already brought him some reputation, but his long investigations on stone weapons and other

remains of early human civilization in the Tertiary and older Quaternary Diluvial strata made him famous. His most striking discovery was that of a fossil human jawbone in the quarries of Moulin-Quignon, near Abbeville, in 1863. Other works of great value are 'Celtic and Antediluvian Antiquities' (3 vols. 1846-65); and 'Antediluvian Man and His Works' (1860).

Bouches - du - Rhone, boosh dü rôn, ('Mouths of the Rhone'), a department in the south of France, in the ancient government of Provence, bounded north by Vaucluse, west by Gard, east by Var, and south by the Mediterranean. Chief town, Marseilles. Area, 1,971 square miles, of which about half is under cultivation, the remainder being occupied by forests, heaths, wastes, water, etc. Between the Rhone and the lagoon of Berre is the great plain of La Crau. Its borders are tolerably well cultivated and support a number of cattle; but the centre is little better than a desert of stones and pebbles, affording, however, winter pasture for sheep. The Rhone is the principal river; near Arles it divides into two branches which enclose an island called La Camargue. Several canals facilitate transport and are especially useful for irrigation. The climate is generally very warm, with little rain during the summer. A cold and generally violent wind, called mistral, always blows from the Cevennes after rain. It lasts from 3 to 9, sometimes, though rarely, even 12 days, and dries up the ground with astonishing rapidity. The soil of the department is for the most part arid and unproductive without irrigation. Vines, however, thrive, and almonds, figs, capers, nuts, and particularly olives, are extensively cultivated. The minerals are of little commercial importance. Salt is extensively manufactured from the lagoons, and the salt-works of Berre are celebrated both for the quality and quantity of their produce. The articles manufactured, besides salt, are principally soap, brandy, olive oil (the best in France), soda, chemicals, vinegar, scents, leather, glass, etc. The fisheries are productive. The department includes the three arrondissements of Marseilles, Aix, and Arles. Pop. (1896) 673,820.

Boucicault, Dion, dī'on boo'sē-kō, Irish dramatic author and actor: b. Dublin, 26 Dec. 1822; d. New York, 18 Sept. 1890. He was educated at London University and wrote his first play, 'London Assurance,' when he was only 19 years old. This was produced at the Covent Garden Theatre in London and won immediate success. He made his first appearance as an actor in 1852 in his own play, 'The Vampire'; in 1853-60 he was in the United States, where his success on the stage was as great as it had been in England. He founded a theatre in Washington and reconstructed the Metropolitan Theatre in New York, but was not very successful as a manager. Returning to London in 1860 he brought out 'The Colleen Bawn,' one of his best-known plays, and was at one time joint manager of the Adelphi and manager of a new theatre, the Westminster. The latter venture was unsuccessful, but he shortly afterward brought out a number of very popular plays. In 1876 he came to New York, where he lived until his death. He continued his work as both actor and playwright, and also opened the New Park Theatre on Broadway.

Boucicault wrote about 400 plays, many of which were adaptations; among the best not already mentioned are: 'Old Heads and Young Hearts'; 'Love in a Maze'; 'Used Up'; 'Corsican Brothers'; 'The Octoroon,' dealing with the condition of the slaves in the United States; 'The Streets of London'; 'The Shaughraun'; 'Daddy O'Dowd'; and 'Foul Play,' a dramatization of Charles Reade's novel of the same name. In 'The Colleen Bawn' he created one of his favorite types, the Irish hero that appears in many of his plays. He also rewrote and adapted 'Rip Van Winkle' especially for Joseph Jefferson's use. While writing his numerous plays he found time to engage in a political controversy with Lord Beaconsfield over the rights and liberties of the Irish people. He introduced many improvements in the staging of plays, being the first to use carpets on the stage and moving scenery.

Boucicault, Mrs. Dion, English actress. Before her marriage to Boucicault she had won success as Agnes Robertson in 'Our Clerks' and other plays. After her marriage she came with her husband to the United States, but returned with him to London in 1860 and took important parts in several of his plays. She again came to the United States and was later separated from her husband.

Boudin, Eugène, è-zhân boo-dăn, French painter: b. Honfleur, 12 July 1824; d. 8 Aug. 1898. He lived in Paris for most of his life, traveling somewhat in Brittany and Holland. He was devoted to the painting of seaports and river scenes, the gray expanses of French skies and waters, the picturesque confusion of ships in harbors. Among his works are: 'Fishing'; 'The Meuse at Rotterdam'; 'Low Tide'; 'High Tide'; 'Getting Under Sail'; 'A Dutch Bark at Antwerp'; and 'Bordeaux Harbor.'

Boudinot, boo-dî-not, Elias, American philanthropist: b. Philadelphia, 21 April 1740; d. Burlington, N. J., 24 Oct. 1821. He studied law at Princeton with Richard Stockton, and in 1760 commenced practice at Elizabethtown, N. J. He early became a devoted advocate of the patriot cause, and in 1774 was a member of the Provincial Convention which took the control of New Jersey out of Gov. Franklin's hands. Congress appointed him commissary-general of prisoners, 15 May 1777; he was elected to Congress in 1777, 1780, 1781, and 1782, and was chosen its president 4 Nov. 1782, and as such signed the treaty of peace with Great Britain. He was director of the mint at Philadelphia 1795-1805, being appointed by Washington, whose trusted friend and counselor he was throughout the Revolution and afterward. From 1772 to 1805 a trustee of the College of New Jersey (Princeton), he founded its cabinet of natural history with a liberal contribution. He was active in the organization of the American Bible Society, becoming in 1816 its first president. By his will he left the bulk of his large estate to various institutions and charities. He wrote: 'The Age of Revelation' (1790), to counteract Paine's 'Age of Reason'; 'Oration 4 July 1793,' before the New Jersey Society of the Cincinnati; 'Second Advent of the Messiah' (1815); 'The Star of the West' (1816), an attempt to identify the North American Indians with the descendants of the lost tribes of Israel.

Boudinot, Elias, Cherokee Indian: d. 10 June 1839. He was one of three Cherokee youth brought before Elias Boudinot (1740-1821) in 1818, and he received that philanthropist's permission to assume his name. He was educated at the mission school at Cornwall, Conn., and married a white lady of that place. He became a man of considerable talent and ability, and of influence among his people. In December 1835, he, with others of his nation, was persuaded to make a treaty with the United States. He was thereupon accused of having betrayed his country and was murdered by the John Ross party west of the Mississippi, 10 June 1839. He published 'An Address to the Whites' (1826), delivered at Philadelphia, 25 May 1825, and edited the *Cherokee Phoenix*, 1828-34.

Boufflers, Louis François, loo-ê frân-swâ boo-flâr (Duc de, dük dè), French soldier: b. 10 Jan. 1644; d. Fontainebleau, 20 Aug. 1711. He saw active service under Condé, Turenne, Crequi, Luxembourg, and Catinat, and was created a marshal of France in 1693. His defense of Namur in 1695, and of Lille in 1708, are famous. The siege of the former place was conducted by King William in person, and cost the allies more than 20,000 men. The latter was conducted by Prince Eugène. An order was sent from Louis XIV., signed by his own hand, commanding Boufflers to surrender; but he kept it secret until all means of defense were exhausted. The retreat of the French after their defeat at Malplaquet, under the direction of Boufflers, was more like a triumph than a defeat.

Boufflers, Stanislaus, Chevalier de, shë-vä-lë-ä dë stän'is-low, French soldier and author (son of the Marchioness of Boufflers, mistress of Stanislaus, king of Poland): b. Luniville, 31 May 1738; d. Paris, 18 Jan. 1815. He entered the army, was soon appointed governor of Senegal, and while in this office made many useful regulations. After his return he devoted himself to that light kind of literature which distinguished the age of Louis XV. His reputation gave him a seat in the States-General, where he was esteemed for his moderation and his good intentions. After 10 Aug. 1792 he left France and met with a friendly reception at Reinsberg from Prince Henry of Prussia, and Frederick William II. A large grant was made to him in Poland for establishing a colony of French emigrants. In 1800 he returned to Paris, where he devoted himself to literary pursuits which in 1804 procured him a seat in the French Institute. He lies buried near the Abbé Delille, and on his tomb is this inscription, written by himself and characteristic of his lively disposition: "Mes amis, croyez que je dors." His works were published in 8 12mo volumes in 1815.

Bougainville, Louis Antoine de, loo-ê äntwän de boo-gän-vël, French soldier and statesman: b. Paris, 11 Nov. 1729; d. same place, 31 Aug. 1811. At first a lawyer, afterward a distinguished soldier, diplomatist, and scholar, he was always remarkable for his energy of character. He fought bravely in Canada under Montcalm, and it was principally owing to his exertions in 1758 that a body of 5,000 French withstood successfully a British army of 16,000 men. Toward the conclusion of the battle he received a shot in the head. The governor of Canada, finding himself unable to

BOUGAINVILLE ISLAND — BOUGIE

defend the colony, sent Bougainville to France for reinforcements. He set off in November 1758, and returned January 1759, after the king had made him colonel and knight of St. Louis. After the battle of Quebec, 13 Sept. 1759, in which Montcalm was killed, and the fate of the colony decided, Bougainville returned to France and served with distinction under Choiseul Stainville, in the campaign of 1761, in Germany. After the peace he entered the navy and became one of the greatest naval officers in France. He persuaded the inhabitants of St. Malo to fit out an expedition for the purpose of establishing a colony in the Falkland Islands, and undertook the command of the expedition himself. The king appointed him captain, and Bougainville set sail with his little fleet in 1763. But as the Spaniards had a prior claim to the islands France was obliged to surrender them, and Bougainville, having returned to France, was commissioned to carry the surrender into execution on receiving from Spain a remuneration for his expenses. For this purpose he set sail with one frigate and a merchant ship from St. Malo, 15 Dec. 1766. After the immediate object of his voyage was accomplished he circumnavigated the world and returned to St. Malo 16 March 1769. He enriched the science of geography by a number of new discoveries. In the American war he commanded several ships of the line with great honor; was in 1779 chief of squadron and in the following year field-marshal in the land forces. After 1790 he devoted himself to science, and in 1796 was admitted to the Institute.

Bougainville Island, an island in the Pacific Ocean, belonging to the Solomon group and under German protection; area, 4,000 square miles. It is separated from Choiseul Island by Bougainville Strait.

Bougainvillea, a small genus of South American tropical shrubs of the natural order *Nyctaginaceæ*, largely used for ornament in warm climates and in greenhouses. Their chief beauties are their large, brilliantly colored bracts, which subtend the inconspicuous flowers. In the climbing species, which are the most popular, the bracts are so numerous as to conceal the foliage and stems as well as the walls upon which the plants are trained. They often remain thus attractive for months. Because of their ease of propagation and cultivation they are rapidly growing in popularity in the United States. For discussion of species, propagation, and cultivation, consult Bailey and Miller, 'Cyclopedia of American Horticulture' (New York 1900-2).

Bough, Samuel, English painter; b. Carlisle, 8 Jan. 1822; d. Edinburgh, 19 Nov. 1878. He never obtained any systematic art instruction. In 1845 he was a scene-painter in Manchester, and later in Glasgow, where Daniel Macnee encouraged him to become a landscape-painter; and he shortly produced 'Shipbuilding on the Clyde.' Among the more important of his oil pictures are: 'Edinburgh from the Canal' (1862); 'Holy Island' (1863); 'In the Trossachs' (1865); 'The Vale of Leith' (1866); 'Kirkwall Harbor' (1867); 'Borrowdale'; 'St. Monance'; 'London from Shooter's Hill' (1872). His 'Royal Volunteer Review' (1860) is in the National Gallery of Scotland. His best oil pictures are spirited and

expressive in touch, and possess a fine sense of atmosphere; but he frequently painted carelessly and hurriedly, and produced much, especially during his later years, that was unworthy of his brush. His numerous water-colors are of more uniform excellence; they are strongly influenced by the example of David Cox, and are especially remarkable for the delicate gray tones of their skies. He settled in Edinburgh in 1855. A collection of over 200 of his works was brought together in the Glasgow Institute in 1880.

Bought and Sold Notes, written memoranda of a transaction, made by the broker in the case, and delivered by him to his principals. They state respectively that the broker has bought for the vendee, and sold for the vendor, the subject of the transaction. When the broker has not exceeded his authority, both parties are bound thereby (4 Esp. 114; 2 Camp. 337). No particular form is required, but there are four kinds: (1) "Where the broker professes to act for both parties, whose names are disclosed in the note. (2) Where the broker does not disclose in the bought note the name of the vendor, nor in the sold note the name of the buyer, but still shows that he is acting as broker and not as principal. (3) Where the broker, on the face of the note appears to be the principal. (4) Where he professes to sign as broker, but is really the principal" (4 Am. & Eng. Enc. Law, 751). The bought and sold notes, however, do not constitute the contract. They may, however, be accepted as evidence of the contract, and not the original contract, when so established by the usage of trade.

Boughton, bôr'tôn, George Henry, English painter; b. near Norwich, England, 1833; d. London 19 Jan. 1905. His parents came to the United States in 1839, and settled in Albany. He studied art without a master, and in 1853 went to London and Paris to continue his studies. After 1861 he resided in London. His best pictures were 'The Idyl of the Birds'; 'Hay-Harvest in Brittany'; 'The Scarlet Letter'; 'Way-side Devotion'; 'Puritans Going to Church'; 'Snow in Spring'; and 'The Return of the May Flowers.' He became a member of the National Academy in 1871; associate of the Royal Academy, London, in 1879; and member of the Royal Academy in 1896.

Boughton, Willis, American educator; b. Victor, N. Y., 17 April 1854. He graduated at the University of Michigan, and since 1892 has been professor of rhetoric and English literature at Ohio University. He has won note in the work of university extension. His writings include 'Mythology in Art' and 'History of Ancient Peoples.'

Bougie, boo-zhê', Algeria, a port on the Bay of Bougie, 120 miles east of Algiers. Bougie was the Salde of the Romans, and in the 5th century was a chief seat of the Vandals. Under the Arabs it was raised to such importance that it was called Little Mecca, and was the entrepôt of the trade between Christendom and north Africa; but after various vicissitudes it had sunk to a small village in 1833, when the French captured the place. Their extensive works have since rendered it a strong fortress and a commercial centre of some value. Pop. (1892) 7,862.

WILLIAM ADOLPHE BOUGUEREAU.

Bougie (Fr. "taper"), in surgery, a smooth cylindrical rod, designed to widen the canals of the human body by its introduction therein, or to apply medicaments to a particular part of the interior of the body. It is distinguished from a catheter by being solid, while the latter are hollow and open at the ends for the purpose of affording a passage for fluids. Bougies are generally pointed at one end, and grow gradually thicker toward the other end, but in some cases they are of the same thickness throughout their whole length, the ends being only rounded off. They are made sometimes of linen dipped in wax and then rolled up, sometimes of a kind of plaster and linen, also of caoutchouc or gutta-percha, or of metal, such as lead, silver, or German silver.

Bouguer, Pierre, pē-ār boo-gā, French scientist: b. Croisic, Brittany, 16 Feb. 1698; d. 15 Aug. 1758. He studied the elements of mathematics under his father, who was an able hydrographer, and is well known as the author of an excellent 'Treatise on Navigation.' In 1727 he gained a prize at the French Academy for the best essay on the masting of vessels. He gained similar prizes in 1729 and 1731, and added still more to his fame by a work entitled 'Traité de la Gradation de la Lumière,' in which he endeavors to ascertain the quantity of light absorbed by transparent bodies, explains the construction of several ingenious instruments which he had invented for the purpose of facilitating such investigations; and maintains that the light of the sun is more intense at its centre than on the edges of its disk, while in the moon the reverse is the case. About this time the figure of the earth was the subject of frequent discussion in the Academy of Sciences; and for the purpose of ascertaining exactly how much it was elevated at the equator and flattened toward the Poles, it was proposed to measure the length of a degree at each of these positions, and at the same time make other observations and experiments of importance to astronomy and navigation. An expedition was accordingly fitted out, in which Bouguer was associated with Godin and La Condamine. The main burden of the task fell upon Bouguer, who published the results in a work entitled 'Théorie de la Figure de la Terre.' A quarrel with La Condamine concerning the honors of the work embittered the latter part of his life, and probably hastened his death.

Bouguereau, Guillaume Adolphe, gē-yōm-ē ād-ōlf boo-grō, French painter: b. La Rochelle, 30 Nov. 1825; d. there 20 Aug. 1905. After many hardships he succeeded in reaching Paris, where he was educated at the studio of Picot and at the Beaux Arts. In 1850 he gained the Prix de Rome and went to Italy to study. His first great success was 'The Body of St. Cecilia Borne to the Catacombs' in the Salon of 1854. Among his paintings are: 'The Meeting of Christ with His Mother'; an 'Annunciation'; 'The Holy Women at the Sepulchre'; 'The Triumph of Venus,' etc. He paints portraits occasionally, but his subjects are chiefly ideal, idyllic, and religious. He is a thorough draftsman, and is thought to excel in the painting of flesh. In 1885 he received the medal of honor at the Salon, was president of the Society of Artists, and received the medal of the Legion of Honor.

Bouilhet, Louis, loo-ē boo-ē-yā, French poet: b. Cany, 27 May 1822; d. Rouen, 19 July 1869. He first achieved fame with 'Mélénis, a Story of Rome' in the time of the Cæsars, and 'The Fossils,' a series of delineations of antediluvians. His versified dramas, 'Mme. de Montarcy' (1856); 'Dolorès' (1862); and especially 'The Conspiracy of Amboise,' are elegant in style, rich in imagery, perfect in melody, but lack compactness of structure and are open to moral censure. The same faults are found in his comedies, 'Uncle Million' (1861); 'Faustine' (1864); and especially in his posthumous 'Mlle Aissé.

Bouillé, François Claude Amour, frān-swā clōd ā-moor boo-ē-yā (MARQUIS DE), French soldier: b. Cluzel Castle, Auvergne, 19 Nov. 1739; d. London, 14 Nov. 1800. He distinguished himself in the Seven Years' war; was appointed governor of Guadaloupe in 1768; and conquered Dominica, St. Eustatia, Tobago, St. Christopher, Nevis, and Montserrat. After the Peace of 1783 he returned to Paris and was appointed lieutenant-general. He afterward traveled in England, through Holland and a great part of Germany, until he was made chief of the province Trois-Evêchés. In the Assembly of Notables (1787-88) he declared for the proposed reforms of Calonne, which, however, were defeated by Cardinal Brienne. He was opposed to the plan of Necker for the union of the provinces. At the breaking out of the Revolution he supported the existing government, both in his former province and in Lorraine, Alsace, and Franche-Comté. It was only at the urgent desire of the king that he swore allegiance to the constitution of 1791. He repressed in 1790 the rebellion of the garrisons of Metz and Nancy; and although the National Assembly decreed him a vote of thanks for the bravery and ability he had displayed on this occasion, still the revolutionists distrusted him. Shortly afterward he made preparations to assist Louis XVI. in his escape. Bouillé had made his arrangements well, and had not the king forbidden any bloodshed he certainly would have rescued him. Being thus compelled to leave the king at Varennes to his fate, he fled from the dangers to which he himself was exposed by the attacks of the revolutionists. From Luxembourg he wrote a threatening letter to the National Assembly, and then exerted himself to excite the foreign powers against the republic. He succeeded well at Vienna, gained over Gustavus III., and obtained the promise of 30,000 men from the Empress Catherine II., to be put under the command of the king of Sweden and the French general. But Gustavus was murdered, the empress forgot her promises, and Bouillé went over to England in 1796. Here he wrote his 'Memoirs of the Revolution,' which appeared in an English translation (Lond. 1797), and, after his death, in the original.

Bouillon, boo-ē-yōn, the name of one of the most distinguished historical families of France. The last Duke of Bouillon of the first line had sold the duchy to the bishop of Liège, but a new line arose toward the end of the 15th century. It originated with a cadet of the house of Marck, which, at the commencement of the 15th century, possessed the principality of Sedan. In 1482 William de la Marck, well-known as "The Boar of Ardennes," seized the

BOUILLON — BOULAINVILLIERS

territory of Bouillon, belonging to the bishopric of Liège, and conferred it on his brother Robert. The bishop of Liège attempted by force to regain it, but this Robert, and a son of the same name who succeeded him, were successful in resisting; and at the end of the war, which was brought to a close in 1492 by the mediation of the king of France, Robert the younger remained virtually, if not formally, Lord of Bouillon. The third Robert succeeded his father last mentioned; and having, like his predecessors, entered the service of France, was made prisoner with Francis I. at the battle of Pavia. He afterward obtained a marshal's baton, and under the name of Marshal de Fleuranges, which was the title he assumed, is known as the author of very curious memoirs. Robert IV., son of Robert III., appears to have been temporarily dispossessed by the bishop of Liège, but recovered possession, and not only became marshal of France, but received the title of Duke, and thus became the first Duke of Bouillon of the new line. He was taken by the Spaniards at the siege of Hesdin in 1553; and three years after, when he had been liberated on parole for the purpose of procuring the 60,000 crowns at which his ransom had been fixed, died by poison. His wife was a daughter of the celebrated Diana of Poitiers. His son, Henry Robert, lost Bouillon, which, by the Treaty of Château-Cambray, returned to the bishop of Liège, but he still preserved the title, and transmitted it to his son William Robert, who died in 1588 without having married. The male line thus became extinct. He was survived by a sister, who married Henri de la Tour d'Auvergne, Viscount Turenne, but died without children in 1594. She had, however, bequeathed her possessions to her husband, and thus the two powerful houses of Turenne and Bouillon were merged into one. This new Duke of Bouillon was one of the most distinguished personages of his time. He was at first devotedly attached to Henry IV. while he was fighting his way to the throne, but afterward leagued with his enemies; and, being implicated in the conspiracy which cost Marshal Biron his life, was long obliged to live in exile. He was restored to favor in 1606, and figured much during the intrigues in the subsequent part of the following reign; and, having embraced the doctrines of the Reformed Church, became one of its most distinguished leaders. He died in 1623, leaving two sons, the younger of whom was the celebrated Marshal Turenne. The elder, named Frédéric Maurice, after serving with distinction in the Low Countries, returned to France, became a Roman Catholic, served Louis XIII., then joined the insurrection against him headed by the count of Soissons, and helped him to gain the battle of Murfée. During the Fronde he joined the princes and took a prominent part in the civil war, but was reconciled to the court in 1651, obtained the title of prince, and received large accessions of territory in exchange for the principality of Sedan. He died in 1652, leaving interesting memoirs of his life and times. He was succeeded by Godefroi Maurice, who figured much in the wars of the period and became great chamberlain to Louis XIV., and who died in 1721. One of his brothers was the celebrated Cardinal de Bouillon, who was born in 1644, obtained the cardinalate when only 26 years of age, was long the representative of the

Gallican Church at Rome, made himself notorious by his vanity, ambition, and intriguing spirit, and died in 1715.

Bouillon, originally a German duchy, now a large district in Belgium, 9 miles wide and 18 long, on the borders of Luxembourg and Liège. This woody and mountainous tract consists of the town of Bouillon with 2,800 inhabitants, and 25 villages with 20,000 inhabitants. The town was once the capital of the duchy of the same name. This ancient place lies in the midst of hills, on the left bank of the Semois, which abounds with fish, 40 miles from Liège and 8 from Sedan. It has a strong castle upon a rock, which, however, is commanded by the neighboring mountains. Godfrey of Bouillon once possessed the dukedom of this name. He was Duke of Lower Lorraine, and Bouillon was bestowed upon him as belonging properly to the county of Ardenne. In order to supply himself with funds for his expedition to the Holy Land, Godfrey mortgaged his duchy of Bouillon in 1095 to the bishop of Liège. After the estate had been held for many years by the bishopric, the houses of La Marck and La Tour d'Auvergne laid claims to Bouillon, but in 1641 relinquished their pretensions to the bishop of Liège for 150,000 Brabant guilders. In the war of 1672 France conquered Bouillon, and Louis XIV. gave it in 1678 to the Chevalier La Tour d'Auvergne, his chamberlain. After this time it belonged to the house of La Tour until the Revolution, when it was taken from them in 1792. The last possessor, Godfrey Charles Henry de La Tour d'Auvergne, died December 1812. By the Peace of Paris, in 1814, the dukedom was included in that of Luxembourg, which had fallen to the king of the Netherlands. The title of prince of Bouillon was assumed in 1792 by Philip d'Auvergne, captain in the British navy, and he continued to bear it till his death in 1816. The congress which met at Vienna in 1815 appointed commissioners to investigate the comparative claims of this nobleman and Prince Charles of Rohan. They decided in favor of the latter. By him it was sold to the Netherlands in 1821, and on the division of the kingdom at the revolution of 1830 it fell to Belgium.

Bouilly, Jean Nicolas, zhōn nē-kō-lār boo-ē-yē, French poet: b. Coudraye, 4 Jan. 1763; d. Paris, 14 April 1842. He made his début with the comic opera 'Peter the Great' in 1790. For a few years he was judge and prosecuting attorney at Tours, and then was called to Paris to assist in organizing the primary school system. He was a man of ancient Roman virtue, and his character is reflected in all his works. His comedies and comic operas (music by the first masters) were eminently successful as well in Germany as in France, particularly 'The Abbé de l'Epée,' 'The Two Days,' 'Mme. de Sévigné.' He also wrote 'Stories for French Children,' and 'Counsels to My Daughter.'

Boulainvilliers, Henri de, ōn-rē dē boo-lān-vē-yā, French historian: b. Saint Saire, Normandy, 11 Oct. 1658; d. 23 Jan. 1722. He studied at the College of Juilli, entered the army, but shortly after became devoted to historical and antiquarian pursuits. He wrote a number of works in connection with the history of France, but is perhaps best known by his 'History of Mohammed,' in which he writes in a very Oriental style, lauds the Prophet, and

seems almost disposed to become a believer in the Koran. He is said to have been much addicted to astrology.

Boulanger, Georges Ernest Jean Marie, zhôrzh är-nést zhôn mǎ-rē boo-lôn-zhâ, French soldier: b. Rennes, 29 April 1837; d. Brussels, 30 Sept. 1891. After a successful career in Algeria and in the East he became minister of war in 1886, and the fact that a new man was in possession of that portfolio was speedily felt. He introduced many needful reforms, insisted on the adoption of a repeating rifle, and caused important experiments to be made with high explosives. In the ministerial crisis of 1887 he lost his portfolio and was appointed to the command of the 13th Army Corps, but was retired, 28 March 1888. In January 1889 he was elected deputy to the National Assembly by 81,000 majority, in consequence of which the Floquet ministry resigned. In August 1889 he was charged with embezzlement, treason, and conspiracy, and found guilty by the Senate; the elections in the 12 cantons were annulled, and he was sentenced to deportation.

Boulanger, Gustave Rodolphe Clarence, goos-täv rō-dōlf klā-rōns, French painter: b. Paris, 25 April 1824; d. Paris, 22 Sept. 1888. He had a wide reputation as a painter of classical subjects; received the Prize of Rome in 1849, and was decorated with the Legion of Honor in 1865.

Boulanger, Louis, loo-ē, French painter: b. Vercelli, Piedmont, 11 March 1806; d. Dijon, 7 March 1867. He studied under Guillon-Lethière and Deverias; became acquainted with Victor Hugo and illustrated many of his works; also taking subjects for many of his paintings from the poems of Hugo and Chateaubriand. Among his paintings are 'Mazeppa,' 'The Triumph of Petrarch,' and 'Macbeth.'

Boulay de la Meurthe, Antoine Jacques Claude Joseph, än-twân zhāk klōd zhō-zēf boo-lā-ē dē lā mērt (COUNT), French lawyer and politician: b. Chamousey, Lorraine, 19 Feb. 1761; d. Paris, 2 Feb. 1840. During the Revolution he served as a volunteer in the army, and as a judge on the bench, until the Reign of Terror, when he was outlawed. After the 9th Thermidor he was appointed presiding judge of the civil court, and afterward held the office of attorney-general at Nancy. He sat in the Council of Five Hundred, was active in the *coup d'état* of the 18th Fructidor, and aided in the revolution of the 18th Brumaire. Being appointed chairman of the legislative section in the Council of State, he took an active part in digesting the *Code Civil*. On the first restoration he kept aloof from public affairs; during the Hundred Days he was again a minister of state; in the abdication of Napoleon I. he caused his son to be proclaimed as Napoleon II., and was appointed minister of justice by the commission of government. He was, of course, outlawed by the returning king, and for four and a half years was an exile. In 1819 he was permitted to return to France.

Boulay de la Meurthe, Henri George, ön-rē zhôrzh (COUNT), son of the preceding: French statesman: b. Nancy, 15 July 1797; d. 1858. He took an active part in the revolution of 1830. In 1837 he was elected to the chamber of deputies. In 1843 he voted for the repeal of the

decree of banishment against the Bonaparte family. In February 1848 he sided with the moderate Republicans, was elected to the Constituent Assembly, and there again supported the motion for the return of the Bonaparte family. When Louis Napoleon was elected president the name of Boulay de la Meurthe was placed by him at the head of the list of candidates for the vice-presidency; and the assembly almost unanimously chose him. After the *coup d'état* of 1851 he was made a member of the Senate.

Boulder, Col., city and county-seat of Boulder County, situated on Boulder Creek and the Union Pac. and other railroads; 30 miles north of Denver, the State capital. It is in a noted gold, silver, coal-mining, agricultural, and stock-raising region, at the eastern base of the Rocky Mountains. It was settled in 1858 and received a city charter in 1880; is the seat of the State University; and has three national banks, daily and weekly periodicals, and a property valuation of over \$1,000,000. The famous Boulder Cañon is an object of wide interest to the tourist. Pop. (1900) 6,150.

Boulder, a rounded water-worn stone of some size; in geology, applied to ice-worn and partially smoothed blocks of large size lying on the surface of the soil, or embedded in clays and gravels, generally differing in composition from the rocks in their vicinity, a fact which proves that they must have been transported from a distance, probably by ice. When lying on the surface they are known as "erratic blocks."

Boulder Clay, the name given to the mass of clay, sand, and boulders deposited by the ice-sheet which invaded the northern portions of North America and Europe during the Pleistocene period. It is also known as "till" and "ground moraine." The material is generally compact and tenacious and shows no stratification, the stones and boulders being irregularly distributed. It represents the detritus carried along beneath the ice and finally left in its present position covering the eroded rock-surfaces upon the retreat of the glacier. Its thickness varies from a few inches to 100 feet or more; the heaviest accumulations are gathered into rounded hills called drumlins (q.v.). The stones included in boulder clay are usually oblong with rounded edges and frequently with striated surfaces, the latter being produced by the friction of the moving mass. See DRIFT; GLACIAL PERIOD.

Boulevard, bool-vär (O. Fr. *boulevard*, a word derived from the German *bollwerk*, the same as the English "bulwark"). The word was formerly applied to the ramparts of a fortified town, but when these were leveled, and the ditches belonging to them filled up, and the whole planted with trees and laid out as promenades, the name "boulevard" was still retained, and thus came to have its present signification. The most famous boulevards are those of Paris, especially those which, in the time of Louis XIV., took the place of the fortifications on the northern side of the city, and became first a promenade and then a street. Modern usage has applied the word to many streets which were not originally ramparts, but which have been cut through the older and denser parts of the town, or have been laid out in the new quarters. All that the more modern boulevards have in

common with the older ones is that they are broad and are planted with trees. The modern boulevards are for the most part situated at some distance from the bustle of the town, and are therefore less frequented than the older ones, which are in the very heart of the city, and in the neighborhood of the chief resorts of amusement and pleasure. In the United States the name is applied to wide avenues planted with shade-trees, and with more or less ornament in the way of statuary, flower-beds, lawns, etc. The Thames Embankment, in London, though not usually called a boulevard, is of this order. See PARIS.

Boulger, Demetrius Charles, English writer: b. 14 July 1853. He is an authority on military topics and with Sir Lepel Griffin founded the 'Asiatic Quarterly Review' in 1885 and edited it for nearly five years. He has published 'Life of Jakooob, Bey of Kashgir' (1878); 'England and Russia in Central Asia'; 'Central Asian Portraits'; 'The History of China'; 'General Gordon's Letters from the Crimea'; 'Armies of the Native States of India'; 'Central Asian Questions'; 'Lord William Bentinck'; 'Short History of China'; 'Life of Sir Stamford Raffles' (1897); 'The Congo State' (1898); 'The Belgians at Waterloo'; 'India in the 19th Century' (1901).

Boulger, Dorothy Henrietta (THEO. GIFT), English novelist: b. 30 May 1847. She is a daughter of Thomas Havers of Thelton Hall, Norfolk, and married George S. Boulger (q.v.), in 1879. She began to publish in 1871, and is the author of 'True to Her Trust,' 'Pretty Miss Bellew,' 'Maid Ellice,' 'A Matter-of-Fact Girl,' 'Visited on the Children,' 'Victims,' 'Lil Lorimer,' 'An Innocent Victim,' 'A Garden of Girls,' 'Not for the Night-time,' 'Dis-honored,' 'Wrecked at the Outset,' 'An Island Princess,' 'Women Who Work,' 'Cape Town Dicky,' 'The Little Colonists,' 'Fairy Tales from the Far East,' 'The Case of a Man with His Wife.'

Boulger, George Simonds, English botanist: b. Blechingly, Surrey, 5 March 1853. He has been professor of botany and geology at City of London College from 1884 and has published 'Familiar Trees' (1886-9); 'The Uses of Plants' (1889); 'Biographical Index of British and Irish Botanists,' with Britten (1893); 'The Country, Month by Month,' with Owen (1894-5); 'Elementary Geology' (1896); 'Flowers of the Field' (1900); 'Wood' (1902).

Boulogne - sur - Mer, boo-lōn sür mār, France, a seaport of the department Pas de Calais, at the mouth and on the right bank of the River Liane, with the suburb of Capécure on the left. The town proper consists of an upper and lower town. The former is surrounded with old and well-planted ramparts; the latter, which is the business section, has straight and well-built streets and is semi-English in character, many of the signboards being in English, the shops having an English air, and much English being spoken. The Church of Nôtre Dame (begun in 1827, consecrated in 1866) has a magnificent high altar, and a crypt, part of which dates from the 12th century. Among the churches, some of which are handsome edifices, there are several for the English population. The castle, which dates

from 1231, is a massive structure, communicating with the upper town by a bridge. It serves at present as a barrack and artillery depot. Here Louis Napoleon was imprisoned in 1840. Other noteworthy buildings are the Hotel de Ville, the Palais de Justice, the large and handsome bathing establishment, the library of 50,000 volumes, the museum of natural history and antiquities, the custom-house, the exchange, etc. Boulogne carries on various industries, is one of the chief French seaports, and is a great fishing centre, giving employment to about 5,000 hands. Extensive improvements in its accommodation for shipping are being carried out or projected. There is a large passenger traffic between Boulogne and Folkestone. Steamboats run daily between this place and England. Boulogne still exhibits some Roman remains. The Northmen took it in 882 and massacred the inhabitants. In 1544 the town was taken by Henry VIII. of England after a siege of six weeks. The English retained it till 1550, when Edward VI. sold it to France for 400,000 crowns. The Emperor Charles V. demolished it in 1553. During the first republic Boulogne received the name of Port de l'Union. With a favorable wind, vessels can reach the coast of England in two or three hours from this place. Bonaparte, therefore, ordered the harbor to be made deeper, and a number of vessels to be built in order to transport the army intended for the invasion of England, and some small forts and batteries to be erected in order to strengthen the harbor and the town. A large army remained here for many months in a camp, which almost resembled a town, waiting to embark; but upon the breaking out of hostilities with Austria in 1805 they were called to other places. Pop. (1896) 46,807.

Boulogne-sur-Seine, sân, France, a town in the department of the Seine, southwest of Paris, of which it is a suburb. It is from this place that the celebrated Bois de Boulogne gets its name. Pop. (1896) 36,984.

Boulton, Charles Arkoll, Canadian soldier and statesman: b. Coburg, 1841; d. 1899. He entered the British army in 1858 and served for 10 years. During the first Manitoba insurrection he fought against the rebels and was captured in 1870 and condemned to death; when the rebellion broke out the second time he commanded a corps organized by himself and known as the Boulton Scouts. He became a member of the Canadian Senate in 1889. He wrote 'Reminiscences of the Northwest Rebellion.'

Boulton, Matthew, English engineer: b. Birmingham, 3 Sept. 1728; d. Soho, 17 Aug. 1809. After being educated at a grammar school he was instructed in drawing by Worlidge, and he also studied mathematics. He engaged in business as a manufacturer of hardware, and as early as 1745 he is said to have invented and brought to great perfection inlaid steel buckles, buttons, watch-chains, etc., of which large quantities were exported to France, whence they were repurchased with avidity by the British as "the offspring of French ingenuity." In 1762 Boulton, finding his manufactory at Birmingham too confined for his purposes, purchased a lease of the Soho, about two miles distant, in the county of Stafford. This spot, then a barren heath, was gradually converted into an exten-

BOUNCING BET—BOUNTY LANDS

sive manufactory and school of the mechanical arts, where ingenious men found ample employment for their talents from the liberal patronage of the proprietor. The introduction of that important machine, the steam-engine, at Soho, led to a connection between Boulton and James Watt, of Glasgow, who became partners in trade in 1769.

Bouncing Bet, or **Old Maid's Pink**, an old-time garden flower common as a weed. See **SOAPWORT**.

Bound Brook, N. J., a town of Somerset County, situated on the Raritan River and on the Baltimore & O., the Central N. J., the Lehigh Valley, and the Philadelphia & R. R.R.'s. It has a large lumber trade, and manufactures woolen goods, electric dynamos, paint, roofing-paper, etc. During the Revolutionary War it was the scene of a surprise of the American troops by Cornwallis. The Americans, being largely outnumbered, were forced to retreat after a short battle. Pop. (1900) 2,622.

Boundaries, American. English monarchs were very ignorant of American geography and were perpetually making grants irreconcilably and even grotesquely conflicting; as when the grants to New Hampshire and New York each included all of Vermont, and those "westward to the South Seas" included all the possible territory out of which later grants, often with the very same phraseology, were made. The Wyoming dispute between Connecticut and Pennsylvania, and the Western Reserve of the former in Ohio, are only samples of the endless wrangles occasioned by these royal gifts; and a considerable part of intercolonial history is the account of the struggles—by influence before the Privy Council, or by compromise or outright war among themselves—by which the present limits were gradually shaped. Short of this, much interesting history is involved in the surveys, from that of Mason and Dixon's Line down to that between Connecticut and Massachusetts, which rectified lines admitted in theory. After the Revolution, jurisdiction over boundaries was assumed by Congress, which, in 1781, under the Articles of Confederation, provided minutely for the selection of a court to determine such cases, modeled on the Grenville Act of 1770. The adoption of the Constitution in 1788 placed all such matters in the final determination of the supreme court. The boundaries between foreign powers and the United States as a whole present a different problem, or rather a series of problems; for which see also **ALASKA**; **ANNEXATIONS**; **CANADA**; **FLORIDA**; **GADSDEN TREATY**; **LOUISIANA PURCHASE**; **MEXICAN WAR**; **NORTHEAST BOUNDARY**; **OREGON QUESTION**; **TREATY OF VERSAILLES**.

Bounty, a grant or benefaction from the government to those whose services directly or indirectly benefit it, and to whom, therefore, it desires to accord some recompense, or at least recognition. In law and commerce, it is a premium paid by a government to the producers, exporters, or importers of certain articles, or to those who employ ships in certain trades. This is done either with the view of fostering a new trade during its infancy, or of protecting an old one which is supposed to be of special importance to the country. In 1800 Congress passed an act providing for a premium to be paid to the producers of cane, beet, and sorghum sugar

by way of bounty. This bounty was in the nature of a contract (made with each and every person in the United States engaged in the cultivation of such varieties of sugar), providing that, in the event their produce attained a given standard of saccharine strength, they should receive the bounty provided therefor by the appropriation from the treasury. This act greatly stimulated the sugar-producing industry of the country, and large amounts of money have been invested, and a larger amount of sugar has been produced in the United States during the years that have followed the passage of the act than in any equal period in the history of the country. All bounties or premiums are not offered for the encouragement of domestic talent and industry to the exclusion of foreign competition. Many of those offered by the British and French governments, and by private associations, are held out to all competitors indiscriminately; and where the object is universal improvement, this is one of the appropriate modes of encouragement, though others concur with it, such as the monopolies of copyrights and patents, and the honors and distinctions conferred on those who make any important improvement. One other class of cases may, properly enough, be made the subjects of bounties or premiums; namely, the productions of extraordinary efforts of ingenuity and skill. A competition is in this way excited, by which none suffers, and all the effects of which are beneficial to a community.

Bounty Mutiny. See **BLIGH, WILLIAM**.

Bounty-jumper, a term used during the Civil War in the United States to denote one who enlisted in the United States military service to secure the bounty paid by the government for volunteers, and then deserted. Some of these enterprising individuals carried on a regular business of enlisting in one place under a certain name, hurrying to the front, receiving the bounty, deserting at once upon its receipt, and reappearing in some other place under a different name, only to re-enlist and repeat the process. The risks were great, but as the bounty was, in some cases, quite large, the practice found many votaries.

Bounty Lands. By royal proclamation of 7 Oct. 1763, American colonial governors were prohibited from making land grants west of the sources of the rivers flowing from the west or northwest into the Atlantic. This was to quiet the apprehensions of the Indians in the Ohio region that their lands were to be granted out. But Lord Dunmore of Virginia was empowered to offer bounties in land to all officers and soldiers who had served in the French and Indian war, and should personally apply to him for warrants,—5,000 acres to each field officer, 3,000 to captains, 200 to subalterns or staff officers, and 50 to private soldiers,—up to 200,000 acres, from the king's domain either in Canada or Florida, or the "crown lands." This was understood by Americans to mean precisely the above western lands, and those who had the ability and foresight selected choice tracts beyond the Alleghanies provisionally in hope of the government validating them later. Washington, for example, by himself and his land agent Crawford, had surveyed 70,000 acres, and secured patents in his own and other officers' names for 63,000, of which his own share was

32,000. Dunmore began giving these warrants on his own responsibility as early as July 1773, and on 21 Jan. 1774 notified all gentlemen, officers, and soldiers to have their surveyors assemble at the mouth of the Great Kanawha River and proceed to survey their claims. The land agents and surveyors who went down the river were stopped and in some cases attacked by the Indians; and this was one of the agencies in bringing about Dunmore's War (q.v.), although trouble had been gathering for a long period from white settlement and Indian murders. The name "bounty lands" has been defined as pertaining to the Northwest Territory lands belonging to the States, because on 16 Sept. 1776 Congress offered land bounties to volunteers in the Revolution (assessing the money to buy them on the several States, to which Maryland objected because the other States had lands and she had none, and so would be unfairly taxed); but it does not appear that the phrase was ever used of them at the time.

Bouquet, boo-kā, Henry, British officer in the French and Indian wars: b. Rolle, Switzerland, 1719; d. Pensacola, Fla., 23 Aug. 1765. He entered the army of the States-General of Holland, then served in the Sardinian army against France and Spain but returned to the Dutch service in 1748 as an officer of the Swiss Guards. When war broke out between France and England in 1755, Bouquet was made lieutenant-colonel of an English regiment known as the Royal Americans. He reached Philadelphia in 1756 and in 1757 was ordered to Charleston with a small detachment of his regiment; but in 1758 returned to Pennsylvania and was made second in command of an expedition against Fort Duquesne in which George Washington also took part. The French deserted and set fire to the fort before the expedition reached there. This gave the control of Pennsylvania to the English, but Bouquet remained in the province, mostly at outlying posts. In 1763 the Indians united in an attempt to expel the English; they massacred many settlers, coming within a few miles of Lancaster, and blockaded Fort Pitt. There was no time to raise provincial troops if the fort was to be saved, so Bouquet set out with a force of 500 regulars, made his way through the forest, taking every precaution against surprise, and defeated the Indians at Bushy Run, within 20 miles of Fort Pitt. The number of the Indians that attacked him was as great as his own force, and his soldiers had never seen Indian warfare, but by skilfully feigning a retreat Bouquet drew the Indians from their cover and completely routed them by a sudden charge. In the following year he led a force of regulars and provincial troops to the forks of the Muskingum River, 150 miles west of Pittsburg. The Indians, overawed by his former victory and by his boldness in penetrating so far into the wilderness, were ready to make peace and surrender their white prisoners. He was subsequently made brigadier-general and commandant of the Southern Colonies of British America and went to Pensacola, where he died.

Bouquet, Jean Claude, zhōn klōd, French mathematician: b. 1819; d. 1885. In 1865 he became professor of mathematics in the Faculté des Sciences of Lyons. He was then called to

Paris, where he taught special mathematics at the Bonaparte Lyceum, and subsequently at the Louis-le-Grand Lyceum. In 1873 he was appointed professor of mechanics at the Sorbonne, and was elected member of the Academy of Sciences in 1875 in the place of M. Bertrand. He also received the decoration of the Cross of the Legion of Honor.

Bouquet de la Grye, Jean Jacques Anatole, zhōn zhāk ān-a-tōl boo-kā-dē-la-gre', French hydrographical engineer: b. Thiers, Puy-de-Dôme, 20 May 1827. He studied at the Polytechnic School, whence he was graduated in 1847 in the hydrographical engineers, and in 1866 he became their engineer-in-chief. He became a member of the Institute; commander of the Legion of Honor, and a member of the Academy, elected in 1884. He is also a member of the bureau of longitudes and vice-president of the committee on hydrography. A project which he has long urged is to make Paris a seaport by means of a ship-canal up the Seine. He is also known as an inventor and improver of astronomical instruments. He has written 'Paris as a Seaport'; 'Notes on Soundings of the Sea'; 'A Hydrographic Study on the Bay of Rochelle,' etc.

Bouquet of Wine, a pleasant, non-spirituos aroma characteristic of good wines, and named on account of its real or fancied resemblance to the odor of flowers and fruits. The precise chemical nature of the substances that give rise to the "bouquet" is not known. They consist partly, without doubt, of a mixture of compound ethers, derived from fatty acids that are produced by the oxidation of albuminous substances and vegetable fats or oils. Essential oils of various kinds must also be included among them. According to some authorities, the kind of yeast that is used in the fermentation has much to do with the bouquet that is developed. Fruit blossoms are occasionally added to the must on account of the "ferment oil" that is developed by their fermentation, and which communicates a fruity smell to the wine. Elder flowers, when added to the must in this way, give rise to an aroma of Muscatel bouquet.

Bouquetin, boo-k'tān', a wild goat of the Alps and Pyrenees. See IBEX.

Bourbaki, Charles Denis Sauter, shārl dē-nē sō-tā boor-ba-ke, French general: b. Pau 22 April 1816; d. Bayonne 22 Sept. 1897. He entered the army in 1836, and fought in the Crimea and Italy. In 1870 he commanded the Imperial Guard at Metz, whence he was sent to England on a secret mission to the empress. Under Gambetta he organized the Army of the North, and commanded the Army of the Loire. His attempt to break the Prussian line at Belfort, though ably conceived, ended in disastrous failure; in a series of desultory attacks on a much inferior force, 15-17 Jan. 1871, he lost 10,000 men. In the wretched retreat to Switzerland that followed on the 27th, reduced to despair by the ill success of his plans, he attempted to commit suicide. From 1873 to 1879 he commanded the 14th Army Corps at Lyons, and in 1881 he retired from service.

Bourbon, Antoine de, ān-twān dē, Duke of Vendôme, and afterward king of Navarre: b. 22 April 1518; d. 17 Nov. 1562. He married, in

BOURBON—BOURBON FAMILY

1548, Jeanne d'Albret, only child of Henry II., king of Navarre, and assumed the title of king in her right. After the accession to the throne of France of the young king Francis II., he endeavored to obtain the control of the affairs of that country, but failed through his want of energy and perseverance. On the death of Francis II., in 1560, he was made lieutenant-general of the kingdom and adviser to the queen mother (Catherine de Medici) during the minority of her son. Upon the breaking out of the civil war, in 1562, he commanded the royal forces, and died of a wound received at the siege of Rouen. His son, Henry of Navarre, became king of France, as Henry IV. (1594).

Bourbon, Charles (CARDINAL), French prince and prelate; brother of Antoine de Bourbon; uncle to Henry IV., king of France: b. 22 Dec. 1520; d. Fontenay-le-Comte 9 May 1590. He was archbishop of Rouen, legate of Avignon, cardinal, peer of France, and member of the Council. In spite of family ties he ardently supported the Guises and the League, and was declared by that faction heir presumptive to the throne on the ground that his brother, Antoine, through heresy, had forfeited his claim. On the death of Henry III. he was declared king, as Charles X., and was recognized by a majority of the *parlements*; though he was all the while a prisoner at Fontenay-le-Comte.

Bourbon, Charles shârl (DUKE OF BOURBONNAIS), French general, known as CONSTABLE DE BOURBON; son of Gilbert, Count of Montpensier and Clara of Gonzaga: b. 17 Feb. 1489; d. 6 May 1527. He received from Francis I., in the 26th year of his age, the sword of Constable. By the coolness with which he faced death in posts of the greatest hazard he excited the admiration of his fellow-soldiers. When viceroy of Milan he won all hearts by his frankness and affability. His fame was not yet tarnished when the injustice of his king deprived him of his offices, banished him from France, and brought the family of Bourbon into disgrace, in which state it continued until the conclusion of the reign of Henry III. Whatever may be the true cause of her conduct, it is certain that the Duchess of Angoulême, mother of Francis I., strove to invalidate a formal donation of Louis XII. The constable, enraged at seeing himself deprived of his estates by the mother of the king whom he had served with so much fidelity and zeal, listened to proposals made him by Charles V. and the king of England. He experienced the usual fate of deserters; he was well received while his services were needed, but narrowly watched to secure his fidelity. Exposed as he was to the contempt of the Spanish nobility and the jealousy of the generals of Charles V., nothing remained to him but his courage and repentance. His ability, however, induced the emperor to bestow upon him the command of an army, and to treat him with honor. He was already beyond the confines of France, when Francis I. sent to demand the sword which he bore as constable, and the badge of his order. His answer displays the anguish of his heart:—"The king took from me my sword at Valenciennes, when he gave to D'Alençon the command of the vanguard, which belonged to me: the badge of my order I left under my pillow at Chantelles." His flight was a misfortune to France; the

expedition of Francis into Italy was arrested. Having been appointed to the command of the imperial troops, he made an unsuccessful attack upon Marseilles, but contributed greatly to the victory of Pavia. When Francis was carried a prisoner to Madrid he went there in person, that he might not be forgotten in the treaties between the two monarchs; but Charles V. delayed concluding them, and Bourbon discovered that he could not trust the emperor, who had even promised him his sister in marriage. Compelled to smother his resentment he returned to Milan, maintained possession of Italy by the terror of his arms, and obtained so much authority as to become an object of suspicion to the emperor, who, in order to weaken him, refused to grant him the necessary supplies. In order to prevent the dispersion of his army he led the soldiers to the siege of Rome, the plunder of which city he promised them. He was the first to mount the breach, and was killed by a ball, shot, it is said, by Benvenuto Cellini. His body being conveyed to Gaeta, his soldiers erected over it a splendid monument, afterward destroyed. See Coignet, 'Francis the First and His Times' (1888).

Bourbon, Louis, loo-e, Spanish prelate: b. 1777; d. 19 March 1823. He was the son of the infant Louis, brother of King Charles III. of Spain, and the Duchess of Chinchon. The marriage was concluded with the royal assent: nevertheless, it was doubted, after the death of Charles III., whether the prince would be lawful heir to the throne, if a male descendant of the old line should be wanting. He therefore entered the Church, was appointed archbishop of Seville in 1799, and of Toledo in 1800. A cardinal's hat was also given to him in 1800. After the imprisonment of Ferdinand VII. at Valencay, he joined the party of the Cortes, and became very influential. He offered, in 1814 the constitution of the Cortes to Ferdinand VII. for his signature; and the king having altered his determination, Bourbon lost his favor and was deprived of the archbishopric of Seville. After the events which took place on the insurrection of the army at the island of Leon, he engaged in the revolution, and was president of the provisional junta before which the king swore, at Madrid, 9 March 1820, to abide by the constitution of the Cortes of 1812.

Bourbon, Louis Henri, loo-e ôñ-re (DUC DE), French courtier, Prince of Condé: b. Versailles, 1692; d. Chantilly, 27 Jan. 1740. As chief of the Council of Regency and superintendent of the king's education, he robbed the public treasury and extorted huge bribes. Made prime minister in 1723, he persecuted the Protestants, and granted exorbitant privileges to the India Company, in which he held shares. He was entirely controlled by his mistress, the Marquise de Prie.

Bourbon (boor-bôn) Family. The founder of this family, which has governed France, Spain, the two Sicilies, Lucca, and Parma, was Robert the Strong, who, in 861, became Duke of Neustria, and in 866 lost his life in a battle against the Normans. Some trace his descent from Pepin l'Heristal, others from a natural son of Charlemagne, and others from the kings of Lombardy. It is certain that the two sons of this Robert were kings of France. The elder,

BOURBON FAMILY

named Eudes, ascended the throne in 888, and died in 898; the younger, Robert, in 922, and died in 923. The eldest son of this Robert was Hugh the Great, Duke of the Isle of France, and count of Paris and Orleans. Hugh Capet, son of Hugh the Great (great grandson of Robert the Strong), founded the third French dynasty in 987. One of his descendants, named Robert, was the root of the elder line of the dukes of Burgundy, which became extinct in 1361. A descendant of this Robert, Henry of Burgundy, was first regent of Portugal in 1095, where his legitimate descendants became extinct in 1383. Pierre de Courtenay, a descendant of Hugh Capet, in the fifth generation, was father and ancestor of many emperors of Constantinople. The house of Anjou descended from Hugh Capet, in the eighth generation, possessed the throne of Naples for two centuries, and for some time that of Hungary. Another descendant of Hugh Capet, in the 10th degree, founded the house of Navarre, which continued from 1328 to 1425. A second family of Anjou, descended from Hugh Capet, in the 13th degree, gave some distinguished princes to Provence. In the same degree, the younger line of the powerful dukes of Burgundy derived its origin from him. This line became extinct with the death of Charles the Bold, in 1477, whose successor, Maria, married Maximilian, archduke of Austria, and became grandmother of Charles V. Robert, Earl of Clermont, second son of St. Louis, married Beatrice, Duchess of Bourbon. In this way the city of Bourbon l'Archambault, or Bourbon les Bains, in the department of Allier (formerly Bourbonnais), became the birthplace of the house of Bourbon, and Louis I., Duke of Bourbon, son of Robert and Beatrice, its founder. Two branches took their origin from the two sons of this Louis, Duke of Bourbon, who died in 1341. The elder line was that of the dukes of Bourbon, which became extinct at the death of the Constable of Bourbon in 1527, in the assault of the city of Rome. The younger was that of the counts of La Marche, afterward counts and dukes of Vendôme. Of these, Charles, Duke of Vendôme, who died in 1537, and who had been the head of the house of Bourbon since the death of the Constable, had two sons, Anthony and Louis, founders respectively of the royal line of Bourbon, and of the line of Condé. Henry, the son of Anthony, obtained the throne of France as Henry IV., when the house of Valois became extinct in 1589 by the murder of Henry III. His father had obtained the kingdom of Navarre through his wife, who inherited it, and Henry now added it to the French dominions. Anthony's younger brother Louis, Prince of Condé, was the founder of the line of Condé. There were, therefore, two chief branches of the Bourbons—the royal, and that of Condé. The royal branch was divided by the two sons of Louis XIII., the elder of whom, Louis XIV., continued the chief branch, which, through his son, Louis (the dauphin), and grandson, Philip V., was separated into the elder or royal French branch, and the younger or royal Spanish branch; while Philip, younger son of Louis XIII., founded the house of Orleans, when he received the duchy of Orleans from Louis XIV. The kings of the elder or French line of the house of Bourbon are as follows: Henry IV., Louis XIII., XIV., XV., XVI., XVII., XVIII., and Charles X. The

house of Bourbon consists of the following branches and members:

A. *The Elder French Royal Line of Bourbons as Distinguished from the Younger Branch or House of Orleans.* The last sovereigns of this line were three brothers, Louis XVI., Louis XVIII., and Charles X. (Louis XVII., son of Louis XVI., never obtained the crown), all of whom were grandsons of Louis XV. Louis XVIII. had no children, but Charles X. had two sons, namely: Louis Antoine de Bourbon, Duke of Angoulême, who was dauphin till the revolution of 1830, and died without issue in 1844, and Charles Ferdinand, Duke of Berry, who died 14 Feb. 1820, of a wound given him by a political fanatic. The Duke of Berry had two children, (1) Louise Marie Thérèse, called Mademoiselle d'Artois, and afterward by marriage Duchess of Parma, died at Venice, 1 Feb. 1864; and (2) Henri Charles Ferdinand Marie Dieudonné, born in 1820, and at first called Duke of Bordeaux, but afterward Count de Chambord. His mother was the Princess Caroline, daughter of Francis I., king of the two Sicilies. Charles X., having abdicated in favor of his grandson Henri above mentioned in 1830, and the dauphin having renounced his claims on the French throne also in favor of the latter, the Count de Chambord was until his death looked upon by his party as the legitimate heir to the crown of France, and was styled by them Henri V.

B. *The Branch of the Bourbons Known as the House of Orleans.*—This branch raised to the throne of France by the revolution of 1830, and deprived of it by that of 1848, derives its origin, as already mentioned, from Duke Philip I. of Orleans (d. 1701), second son of Louis XIII., and only brother of Louis XIV. By his second wife, Charlotte of the Palatinate, he left as his successor in the dukedom his son Philip, known as Duke of Chartres during his father's lifetime, and was regent of France during the minority of Louis XV. Philip, second Duke, was succeeded by his son, Louis Philip (b. 1703), who married a princess of Baden, and died in retirement in 1752, leaving a son of the same name. Louis Philip, Duke of Orleans, who was born in 1725, and died in 1785. The son of the last-mentioned Duke was Louis Joseph Philip, the Duke of Orleans whose name figures in the first French Revolution, who perished on the scaffold in 1793, after he had laid aside his princely name the year before and assumed that of "Citizen Egalité." He left four children: (1) Louis Philip, before the Revolution Duke of Chartres, after his father's death Duke of Orleans, from 1830 to 1848 king of France, died 26 Aug. 1850, leaving a numerous family; (2) the Duke of Montpensier, who died in England in 1807; (3) the Count de Beaujolais, who died at Malta in 1808; and (4) a daughter, Adelaide, Mademoiselle d'Orleans, born in 1777, died 31 Dec. 1847. The eldest son of King Louis Philip was Ferdinand, Duke of Orleans (b. 1810, d. 1842), who married a daughter of Frederick Louis of Mecklenburg-Schwerin, and left two sons: (1) Louis Philip, Count de Paris, b. Paris, 24 Aug. 1838; and (2) Robert, Duke of Chartres, b. Paris, 1840. Louis Philip having abdicated in favor of the former in 1848, the Count de Paris till his death in 1894 was looked upon by the Orleanists as the true heir to the throne. He was married to his cousin, Isabella, a daughter of the Duke of Montpensier, and left issue.

C. The Spanish-Bourbon Dynasty.—In 1700 Louis XIV. placed his grandson Philip, Duke of Anjou, on the Spanish throne, who as Philip V. founded the Bourbon dynasty in Spain. Philip V. was succeeded in 1746 by his son, Ferdinand VI., who, dying in 1759 without heirs, was succeeded by his brother, Charles III. To him succeeded (1788) his son Charles IV., who, in 1808, resigned the throne in favor of a successor nominated by Napoleon, and died at Naples in 1819. His son Fernando, Prince of the Asturias, obtained the crown on the fall of Napoleon, and reigned as Ferdinand VII., dying 29 Sept. 1833, and leaving behind him two daughters by his third marriage, the elder of whom succeeded him as Isabella II. She was married, in 1846, to her cousin Francisco de Assis. In 1868 she had to leave Spain in consequence of the revolution, and in 1870 she renounced her claims to the throne in favor of her son Alphonso, who became Alphonso XII., and died in 1885, his son, Alphonso XIII., succeeding him.

D. The Royal Line of the Two Sicilies.—The Two Sicilies being then a possession of the Spanish monarchy, in 1735 Don Carlos, the younger son of Philip V. of Spain, obtained the crown and reigned over Sicily and Naples as Charles III. In 1759, however, he succeeded his brother Ferdinand VI. on the Spanish throne, when he transferred the Two Sicilies to his third son Fernando (Ferdinand IV.), on the express condition that this crown should not be again united with Spain. Ferdinand IV. had to leave Naples in 1806; but after the fall of Napoleon he again became king of both Sicilies under the title of Ferdinand I. He was succeeded by his son Francis I. in 1825; Francis was succeeded by his son Ferdinand II. in 1830; and the latter was succeeded by his son Francis II. in 1859, who was deprived of the kingdom in 1860.

E. The Ducal Line of Parma.—This line, like that of the Two Sicilies, was founded by a son of Philip V. of Spain, namely: Don Philip, his youngest son, who obtained the duchies of Parma and Piacenza in 1748. Louis, grandson of Don Philip, obtained Tuscany likewise (1802), with the title of king of Etruria. The family did not long retain this honor, however, being soon forced by the power of France to give up not only Etruria, but also Parma and Piacenza; and it was not till 1847 that there was again a Bourbon Duke of Parma. In 1859 the reigning Duke, Robert, had to leave his dominions, which were soon incorporated in the kingdom of Italy. See Coiffier Demoret, 'Histoire du Bourbonnais et des Bourbons' (1824); Achaintre, 'Histoire Chronologique et Généalogique de la Maison Royale de Bourbon' (1825); Coxé, 'Memoirs of the Kings of Spain of the House of Bourbon' (1815); Lehes, 'Généalogie des Bourbons de France, d'Espagne, de Naples, et de Parme' (1880); Bingham, 'The Marriages of the Bourbons' (1890).

Bourbon, Isle of. See RÉUNION, ISLE DE LA.

Bourbon-Lancy, län-se, a French watering place, department Saône-et-Loire, famous for its thermal springs, containing chloride of sodium and iron. Its situation is notably fine, and by the Romans it was called Aquæ Nisinei or Nisienses. Remains of the Roman baths are still to be seen here, and the town contains a hospital, built by the Marquis d'Aligre, with 400 beds. Pop. (1896) 4,162.

Bourbon-Vendée, vöñ-dā, **Napoléon-Vendée,** or, since the dissolution of the Second Empire in 1870, **La Roche-sur-Yon,** a town in France, the capital of the department Vendée, 231 miles southwest from Paris, situated on a hill on the right bank of the Yon. The streets nearly all end in a spacious square, bordered with ranges of fine trees, and surrounded by public monuments and elegant mansions. The parish church, with a peristyle of six Doric columns, and the mairie or mansion-house, an elegant Italian building, are both in the square. Besides these there are an elegant market-house, theatre, and extensive public offices, large barracks, and a small public library. There is an active trade in woolen cloth, and hardware. It was founded by Napoleon I. on the site of the ancient castle of Roche-sur-Yon, destroyed at the Revolution, and received the name of Napoléon-Vendée, which was changed to Bourbon-Vendée at the Restoration. Pop. (1891) 12,215.

Bourbon Whisky, a term applied to Kentucky whisky, made from a mixture of corn, rye, and malt, of which the corn constitutes the larger part. In its distillation some of the oils and acids are allowed to remain. These, with age, undergo chemical action, and are converted into aromatic ethers.

Bourbonnais, a province and government of old France, with the title, first of a county, and afterward of a duchy, lying between the Nivernais, Berry, and Burgundy. It now forms the department of the Allier. It derived its name from the small town Bourbon l'Archambault, from which the Bourbon family received their title. Consult Montegut, 'En Bourbonnais et en Forez' (1880).

Bourbonnais, boor-bön-nā, Ill., a village in Kaskaskia County, 56 miles south of Chicago, the seat of two important Roman Catholic schools, Notre Dame Academy, and Saint Viator's College, opened in 1865. Pop. 595.

Bourbonne-les-Bains, boor-bün-lā-bän, a town of France, department of Haute Marne, 21 miles east-northeast of Langres, with hot springs, which were resorted to by the Romans. They contain much chloride of sodium, with a temperature which varies from 140° to 150° F., and frequented by some 3,000 invalids annually. The town has a 12th century church, a large military hospital, and interesting ruins of an ancient château. Pop. (1896) 4,156.

Bourboule, boor-bool, **La,** France, a health resort in the department of Puy-le-Dôme, 22 miles southwest of Clermont. It is picturesquely situated amid striking scenery and its mineral thermal springs are visited by over 7,000 persons yearly. Its waters when bottled are extensively exported for medicinal use. Pop. 1,947.

Bourchier, boor'chī-ër, **Arthur,** English actor: b. Speen, Berkshire, 22 June 1864. He was educated at Oxford where he was prominent in amateur theatricals and in 1880 went upon the stage. He has played in leading theatres in England and the United States and took the Royalty Theatre in 1895 when he brought out one of his own adaptations, 'The Chili Widow,' which ran 300 nights, and the Garrick Theatre in 1900, where he produced Barrie's play, 'The Wedding Guest.'

Bourdaloue, Louis, loo-e boor-dā-loo, the founder of genuine pulpit eloquence in France: b. Bourges, 20 Aug. 1632; d. Paris, 13 May 1704. He was sixteen when he entered the society of Jesuits and his instructors successively entrusted to him the chairs of polite letters, rhetoric, philosophy, and moral theology. In 1669 he entered the pulpit, and extended his reputation by attacking, with a powerful and religious eloquence, free from the bad taste of the age, the passions, vices, and errors of mankind. The dignity of his delivery, and the fire of his language, made him distinguished, amidst the victories of Turenne and the feasts of Versailles, among the master-spirits of the arts and of literature in the time of Corneille and Racine. Louis XIV. invited him, in 1670, to preach before the court, and Bourdaloue acquitted himself with so much success that he afterward received invitations at 10 different times. After the repeal of the Edict of Nantes, he was sent to Languedoc, in order to explain to the Protestants the doctrines of the Roman Catholic faith, and he succeeded in this difficult business in reconciling the dignity of his office with the rights of mankind. In his latter days he devoted himself to the care of hospitals, prisons, and religious institutions. He well knew how to accommodate his manner to the capacity of those to whom he gave instruction, advice, or consolation. With the simple, he was simple; with the learned, he was a scholar; with free-thinkers, he was a logician; and came off successful in all those contests in which the love of his neighbor, religious zeal, and the duties of his office, involved him. Beloved alike by all, he exercised authority over the minds of all; and no consideration could make him give up his openness and integrity of character. His 'Sermons and Moral Discourses' appeared in English (3d ed. 1855); and 'Married Life: Its Obligations and Trials' (1897). See Fengère, 'Bourdaloue, sa prédication et son temps' (1874); Tousserat, 'Étude généalogique sur les Bourdaloue' (1900).

Bourdillon, Francis William, English poet: b. 22 March 1852. He has taught private pupils for many years and as a poet is widely known as the author of the lyric, 'The Night Has a Thousand Eyes.' His published works include 'Among the Flowers' (1878); 'Aucasin and Nicolette' edited and translated (1887); 'Ailes d'Alouette' (1890); 'A Lost God' (1891); 'Sursum Corda'; 'Nephele,' a much admired musical romance (1896); 'Minuscula' (1897).

Bourdon, Sébastien, sâ-bās-te-ôn boor-dôn, celebrated French painter: b. Montpellier, 1616; d. 1671. Being poor and without occupation, he enlisted as a soldier. After receiving his dismissal, he visited Italy, and studied under Poussin and Claude Lorraine. In 1652 he was driven from the French kingdom by the religious troubles, when he was appointed first painter to Queen Christina of Sweden. He afterward became distinguished in his own country by many great works, among which are the following: the 'Dead Christ,' the 'Old Kings of Burgundy in the Senate-house at Aix,' the 'Adulteress.' He had no peculiar manner, but he imitated others. He was a good engraver on copper. He died while engaged in painting the ceiling of the Tuileries.

Bourdon, named after the inventor, a barometer consisting of an elastic flattened tube of metal bent to a circular form and exhausted of air, so that the ends of the tube separate as the atmospheric pressure is diminished, and approach as it increases. The Bourdon is commonly known as the metallic barometer, although the aneroid is also metallic, and both holosteric.

Bourdon de L'Oise, François Louis, frañ-swā loo-e boor-dôn-dè-lwāz, French revolutionist: b. Saint Remy, about 1750; d. Cayenne, Guiana, after 1797. He figured in the attack on the Tuileries, 10 Aug. 1792, and did much to bring to pass the execution of the king and the fall of the Girondists, but from July 1794, adopted the side of the nobles and clergy. After joining a Royalist club he was proscribed and transported to Cayenne in 1797, where he died not long after.

Bourg-en-Bresse, boorg-ân-brès, a town of France, capital of the department of Ain, situated 232 miles southeast of Paris, on the Reys-souse and the Cône. It is well built, and ornamented with public fountains, one of which was erected to the memory of Gen. Joubert. On the Promenade du Bastion is a bronze statue of Bichat, the celebrated anatomist, who pursued his early medical studies in the hospital here. The parish church of Bourg-en-Bresse is a handsome edifice of the 16th century. Outside the town is a magnificent hospital, surrounded by gardens; and the beautiful Gothic church of Brou, built by the direction of Margaret of Austria, daughter of Maximilian I. In front of the portal stands a curious elliptical sun-dial, reconstructed by the celebrated astronomer Lalande, who was a native of this place. Bourg-en-Bresse has a library, a museum, a lyceum, seminary, two hospitals, a lunatic asylum, some manufactories of linen and hosiery, tanneries, a cotton-mill, grain market, etc. Its trade in grain, cattle, horses, and wine is considerable. Pop. (1896) 18,501.

Bourgelat, Claude, klöd boorz'h'la, French lawyer, founder of the veterinary schools and creator of the art of veterinary surgery in France: b. Lyons, 1712; d. 3 Jan. 1779. He established the first veterinary school in his native town in 1762, and by his works on the veterinary art furnished the world with a complete course of instruction both in its theory and in its practice; they include 'Eléments d'Hippiatrique, ou Nouveaux Principes sur la Connaissance et sur la Médecine des Chevaux' (1750-3); and 'Traité de la Conformation Extérieure du Cheval' (1776).

Bourgeois, Charles Arthur, Baron, shärl är-tür boor-zhwā, French sculptor: b. 1838; d. 1886. He was a student of Duret and M. Guillaume. Among the more notable of his works are the 'Arab Washerwoman'; and the 'Greek Actor,' in bronze; 'St. Agatha'; 'The Slave'; and 'Hero and Leander,' in plaster; 'The Delphic Pythos' and several busts in marble, and 'St. Joachim' and 'Religion,' two stone figures for the church of St. Eustache and the Church of the Sorbonne, respectively.

Bourgeois, Leon Victor Auguste, lā-ôn vèk-tôr ā-goost, French politician: b. Paris, 1851. After holding several positions of importance he became director of the ministry of the

BOURGEOIS — BOURGOING

interior in 1886 and in 1887 prefect of police. He was minister of the interior in 1889; minister of public instruction 1892-3 and prime minister 1895-6. He was for a time in 1898 minister of public instruction for the second time, and in 1899 was at the head of the French delegation to the peace conference at The Hague. He has written 'Solidarité' (1897).

Bourgeois, Sir Peter Francis, English painter: b. London, 1756; d. 8 Jan. 1811. At first intended for a military career, he soon determined to become an artist. In 1776 he went on a tour through France, Holland, and Italy, and three years later he exhibited his first picture. Elected A.R.A. in 1787, he became R.A. in 1793, and landscape painter to George III. in 1794. King Stanislaus of Poland in 1791 appointed him his painter and conferred on him the honor of knighthood, and shortly afterward George III. also knighted him. He bequeathed many pictures and a considerable sum of money to Dulwich College.

Bourgeois, bŭr-jois', a size of printing type larger than brevier and smaller than long primer, used in books and newspapers.

Bourgeoisie, boor-zhwā-ze, a name applied in France to citizens of towns who do not belong to the nobility or clergy, and in a narrower sense to townspeople occupying an independent position — merchants, tradesmen, independent artisans, lawyers, etc. In the early period of the Middle Ages this class was much oppressed, and as a consequence of that it was poor and possessed little culture and refinement. In subsequent centuries it succeeded in raising itself in all these respects, and latterly attaining a position of political equality with the nobility and clergy, came to be spoken of as the "third estate" (*tiers état*). The word is now used in a somewhat vaguer sense than formerly, and may be taken to correspond with the equally vague English appellation the "middle classes."

Bourges, boorzh, France, capital of the department of Cher, 124 miles south of Paris, on the canal of Berry and the Central railroad, in an extensive plain, at the confluence of the Auron and the Yèvre. When the Romans invaded Gaul, it was known as Avaricum, the capital of Biturigesubi. It was taken by Cæsar, 52 B.C., and almost all its inhabitants slaughtered. Under the name of Bituriges, it was for 475 years the metropolis of Aquitania. During the Middle Ages, many councils were held here. The French clergy assembled here in 1438 to receive the famous charter known as the Pragmatic Sanction, by which the liberties of the Gallican church were secured. Jacques Cœur and Louis XI. were both born here. The former established here in 1463 a university, where Cujas taught during the 16th century. Bourdaloue, the famous preacher, was born here in 1632. Don Carlos resided here from 1839 to 1845, when he signed the abdication in favor of his son. The trial of Louis Blanc, Albert, and others, took place before the supreme court at Bourges, 7 March to 2 April 1849. The city is partly surrounded by a thick wall, flanked with lofty towers; its streets are irregularly laid out, while the houses are generally mean-looking, with their gables to the street. Among the old buildings which it contains are the magnificent cathedral, larger than Notre Dame de Paris,

and one of the finest Gothic monuments of Europe; the city hall, built at great cost by Jacques Cœur as a dwelling-house, and now occupied as the Palais de Justice; and the palace of the archbishop. The establishments of public instruction, including the imperial college, the theological seminary, and the normal school, are well patronized. Bourges has manufactories of fine and coarse cloths, iron foundries, and tanneries. Pop. (1896) 43,587.

Bourget, Paul, pōl boor-zhā, French novelist: b. Amiens, 2 Sept. 1852. After a brilliant course at the Lyceum of Clermont-Ferrand, where his father was professor of mathematics, and the College of Sainte Barbe, he graduated with high honors in 1872. He began to write in 1873, but it was 10 years before he found his true work, though he contributed, the while, numerous articles to the magazines, and published three volumes of striking verse, 'La Vie Inquiète' (1875); 'Edel' (1878); and 'Les Aveux' (1881). His 'Essais' (1883) was the first indication of his strength. The second series, 'Nouveaux Essais de Psychologie Contemporaine' (1886), was a singularly subtle and exceedingly searching inquiry into the causes of the pessimism then widely prevalent in France. Bourget's first novel, 'L'Irréparable' (1884), was followed by 'Cruelle Enigme' (1885); 'Un Crime d'Amour' (1886); 'André Cornélis' (1887), and 'Mensonges' (1887). The keen insight into the hidden springs of human motive, and the marvelous subtlety of psychological analysis of these stories, together with their clearness and refinement of style, have lifted Bourget into the front rank of contemporary French novelists. His intimate knowledge of English and Italian life, and his travels in Spain and Morocco, gave him the material for 'Sensations d'Italie' (1891); and 'Cosmopolis' (1892); and he recorded his impressions (1894) of travel in the United States. Other novels are 'Le Disciple,' 'Notre Cœur,' 'La Terre Promise,' 'Un Saint,' 'Antigone,' 'Drame de famille' (1900); 'Un homme d'Affaires' (1901); 'La fantôme' (1901). Bourget was admitted to the Academy in 1894.

Bourgoin, Edmé Alfred, ěd-mā āl-frā boor-gwān, French chemist: b. Saint Cyr-les-Colonne, 1836. In 1867 he became chief pharmacist of the Children's Hospital in Paris and has been director of the central pharmacy of the Paris hospitals from 1885. Among his writings are 'Electro-chimie' (1868); 'Chimie organique, Principes de la classification des substances' (1876); 'Traité de Pharmacie galénique' (1880).

Bourgoin, a French town, capital of a canton in the department Isère in southeastern France. It is situated on the River Bourbre and was called by the Romans Bergusium. It contains important paper, linen, and woolen industries. Pop. (1901) 7,279.

Bourgoing, Jean François, zhōn fran-swā boor-gwān, French diplomatist: b. Nevers, 20 Nov. 1748; d. Carlsbad, 20 July 1811. While at a military school in Paris his talents were so marked that he was educated by the government at the University of Strassburg for the diplomatic service. After four years spent in Germany on diplomatic missions he went to Madrid in 1777 and was secretary of legation there

seven years, writing in that time his noted 'Nouveau voyage en Espagne, ou Tableau de l'état actuel de cette monarchie' (1789). In 1791 he was minister plenipotentiary to Spain, minister to Saxony in 1808, and was at various times employed on diplomatic missions to Germany and Holland. Besides the work above named he wrote 'Mémoires historiques et philosophiques sur Pie VI.' (1789).

Bourignon, Antoinette, än-twän-ët boo-re-nyôn, Flemish visionary: b. Lille, 13 Jan. 1616; d. Franeker, 30 Oct. 1680. She was born so ugly that her parents held a consultation to determine whether it would not be better to destroy her as a monster. She was spared, but her infancy was spent in neglect and solitude. The first books she put her hands on were lives of early Christians and mystical tracts, which she read eagerly. She entered a convent and was subsequently in charge of a hospital at Lille, but was obliged to leave on account of her religious vagaries. She held that religion consists in internal emotion and is independent of knowledge or practice. Her views were adopted by large numbers of Protestants and Roman Catholics, and in the 17th and 18th centuries Scottish Presbyterian ministers were for a long time compelled to renounce Bourignonism at their ordination. Among her works are 'Treatise of Solid Virtue' (1699); 'The Light of the World' (1696, in English 1863); 'Restoration of the Gospel Spirit' (1707).

Bourinot, boo're-nôt, Sir John George, Canadian publicist: b. Sydney, Nova Scotia, 24 Oct. 1838; d. 14 Oct. 1902. He was educated at Trinity College, Toronto; founded and edited the *Halifax Reporter*, became clerk of the Dominion parliament in 1880; was created a member of the Order of St. Michael and St. George in 1890; and in 1892 became president of the Royal Society of Canada. His publications include 'The Intellectual Development of the Canadian People' (1880); 'Manual of Constitutional History' (1888); 'Parliamentary Government in Canada' (1892); 'Parliamentary Procedure and Practice' (1884); 'How Canada is Governed' (1895); 'Canada's Intellectual Strength and Weakness' (1893); 'Canada Under British Rule' (1900); 'Cape Breton and Its Memorials of the French Régime' (1892).

Bourke, John Gregory, American military officer: b. Philadelphia, Pa., 23 June 1846; d. 8 June 1896. He was graduated at West Point in 1869, and saw much service against the Indians, rising through various grades to the rank of major. He became an expert in American ethnological lore; was a past president of the American Folk-lore Society, and wrote 'Snake Dance of the Moquis,' 'Medicine Men of the Apaches,' and other books. He distinguished himself on the Mexican border. He was an officer of great courage and ability.

Bourmont, Louis Auguste Victor, 100-ë â-goost vëk-tor boor-môn, (DE CHAISNES COMTE DE), marshal of France: b. 2 Sept. 1773, at the castle of Bourmont in Anjou; d. there 27 Oct. 1846. At an early age he took part in the campaign in La Vendée, at a later period entered the Republican army, and was advanced by Napoleon, under whom he had distinguished himself at Dresden and Nogent, to the rank of general of division. Although he had gone over

to the Bourbons in March 1814, Napoleon, on his return from Elba, gave him a command, which, however, Bourmont resigned before the battle of Ligny, in order to go over to the side of the allies. Some years after, as commander of the army of intervention in Spain, he obtained some brilliant successes. His greatest victory was the conquest of Algiers, which procured him a marshal's staff in 1830. After the revolution of July 1830, he followed the banished dynasty into exile. In 1833 Dom Miguel, king of Portugal, placed him at the head of his troops which were to act against the adherents of Dom Pedro; but he was unsuccessful. He afterward sought to act in the interests of the Carlists in Spain, and when he at last returned to his native country found that he had almost entirely lost his popularity, and accordingly retired for the rest of his life to his estate in Anjou.

Bourne, Edward Gaylord, American educator: b. Strykersville, N. J., 24 June 1860. He was graduated at Yale in 1883, and has been professor of history there since 1895. He has written 'The History of Surplus Revenue'; is one of the editors of the 'Yale Review'; and published a collection of his writings on historical subjects under the title of 'Essays in Historical Criticism.'

Bourne, George, American clergyman and anti-slavery writer: b. Westbury, Wiltshire, England, 1780; d. New York, 14 Dec. 1845. In 1804 he settled at Harrisburg, Pa., where he set up a printing office. He was an earnest advocate of the total and immediate abolition of slavery, a position which aroused considerable opposition to him, and in 1815 he formed a church composed of non-slaveholders. His ultra-radical views at last obliged him to remove to Germantown. Afterward he resided for intervals at Sing Sing, N. Y., Quebec, and New York, where he founded a paper, *The Protestant Vindicator*. He wrote: 'The Book and Slavery Irreconcilable' (1815); 'Lectures on Ecclesiastical History' (1822); 'Pictures of Quebec' (1830); 'Slavery Illustrated in Its Effects upon Women' (1834).

Bourne, Hugh, founder of the sect of Primitive Methodists in England: b. Fordhays, Staffordshire, 3 April 1771; d. Bemersley, Staffordshire, 11 Oct. 1852. About 1810, some of the Wesleyan Methodists were desirous of renewing the primitive form of worship and constitution, and wished particularly to revive camp meetings. These practices were considered unadvisable, and accordingly Mr. Bourne and his friends were expelled from the body. They were 20 in number, and Hugh Bourne was acknowledged their elder. The name of Primitive Methodists was adopted in 1812, but by their opponents they were long styled 'Ranters.' The sect is now a powerful body in England, numbering in 1901, 198,874 members and 1,100 ministers. In the United States it has 74 ministers, 90 churches and 6,549 members. In 1844 Bourne visited the United States, where his preaching excited much attention. He also visited Canada, Scotland, and Ireland, where he met with great success in his work. He published a 'History of the Primitive Methodists' (1823), and founded, in 1824, 'The Primitive Methodist Magazine.'
